BROOKLYN, N. Y.

FOR DESCRIPTION SEE PAGE 10.

The Vegetable Garden.

SEASONABLE HINTS.

To the superficial observer or the novice, this month may not, at a first glance, suggest gardening work of much importance. Yet the gardener who neglects to take advantage of the opportunities the winter season offers for thorough preparation is apt to fall behind-hand throughout the year. Although nothing can be done in the frozen ground, the ever-ready field of our mind is as amenable to tillage and culture now as at any time. With the increased leisure which the long evenings and the cheerful influences of a cozy winter home afford, no one should fail to sow the seed and reap as rich a harvest from his intellectual garden as lies in his power.

Plans for all contemplated garden work should now be carefully considered, matured, and as fully prepared as circumstances permit.

A Map or Sketch of the garden plot, roughly drawn on paper, is a material help, and saves much time at "garden-making season." The rows for the different kind of vegetables to be planted may be marked on the paper, and the amount of seed required of each ascertained from the directions given in most catalogues.

Seeds should be ordered as soon as the varieties and quantities wanted have been determined. The earlier this is done, the surer one may be of receiving promptly just what is ordered, and of the best quality, thereby frequently avoiding much vexation and delay at a time when every hour is precious.

Fixed Rules are well enough, and necessary in certain operations; but the idea that everything in gardening has to be done according to invariable rules and unalterably established rites is to many a great hinderance: it dims observation and dulls judgment, both of which are more essential to successful gardening than all precepts.

Coal-ashes.—With every year we become more and more convinced of the value of coal ashes. Some of their fertilizing effects may be due to the wood that is occasionally used in connection with the coal; but that sifted coal-ashes alone are of considerable value on heavy land we have become fully satisfied in many instances. On such lands all crops are benefited by their use. Some parts of our garden which had received a liberal dressing of coal-ashes during the previous winter, suffered much less from the severe drought of last summer than the adjoining ground which had not been so treated. By scattering the sifted ashes over the ground during winter, full benefit will be derived from them the following season.

Vegetables stored in cellars require occasional attention during winter; they should be examined from time to time, and have all decaying matter removed.

HENDERSON'S WHITE PLUME CELERY.

With the introduction of the dwarf and half-dwarf varieties, Celery culture has become so much revolutionized and has received so powerful an impetus, that but few gardens of any pretensions can now be found without at least one row of this delicious vegetable. The number of excellent varieties adapted for general cultivation is already large, so that one not over-sanguine should hardly have expected improvement in this direction, yet this new variety, represented in our illustration, is as decided an improvement over the old kinds as the half-dwarfs were over the giants.

The principal superiority of the White Plume Celery consists in its inner leaves and stalks being naturally pure white, so that by

HENDERSON'S WHITE PLUME CELERY.

closing and tying the outside stalks together, and drawing a small quantity of soil against the plants, the work of blanching is completed with hardly a quarter of the labor necessary with the older kinds. In market gardeners' parlance, they require only to be "handled." This is surely a very great improvement, which will make Celery growing as easy as the culture of any other vegetable.

Its other great merit is its exceedingly handsome appearance, to which even so excellent an illustration as the accompanying one can do but faint justice. As a table ornament it is as attractive as a vase of flowers almost. In quality it is equal to the best, being crisp, solid, yet tender and of a very pleasant, mild flavor, free from all rankness.

The White Plume Celery is now first in-

troduced, and is especially recommended for fall and early winter use, as the delicate texture of its stalks and leaves does not adapt it for keeping till spring.

ASHES AS A FERTILIZER.

Under certain conditions ashes are very valuable as a garden manure, but some discrimination must be used in their application. My experience with them is that they should be applied and well worked into the soil, before planting the seed. Last spring I tested them in the hill with Potatoes. I planted two rows manured with a liberal quantity of ashes, another with lime, and another with well-rotted poultry manure. All were applied in the hill. The Potatoes in the rows where the ashes were applied were scabby, more so than I would like,—the rest were entirely free, nice, and clean. In previous trials, where the ashes were scattered broadcast over the land and then thoroughly worked into the soil, they proved very beneficial, without injuring the Potatoes, as when applied in the hill.

Last spring I planted my Salsify in a place where a large brush pile had been burned, leaving a heavy coat of ashes all over the soil, which was afterward well plowed and harrowed and laid off in drills in which the seed was sown. I never had a finer crop. The roots were large, nice, and smooth. The soil was new black loam. Scarcely a weed made its appearance; while, the year before, the weeds were very troublesome, and as the land had never been in cultivation they were allowed to mature their seed.

A good top dressing of unleached ashes is especially valuable for Onions, if not applied too thick; but to some tender vegetables they do more harm than good when used as a top dressing. They are especially good for loosening a stiff soil, on which their effect will be apparent for a long time; and, in the orchard, I do not know of anything more valuable.

The saving of ashes will pay manifold, even at an expense of building a place for the purpose of storing them. But to obtain the most profitable results, they should be thoroughly worked into the soil, especially in the garden, and should not be applied directly to root crops. Finally, it should be borne in mind that their effects are more apparent on a stiff clayey or hard-pan soil than on a black sandy loam.

N. J. SHEPHERD.

DESTROYING THE PEA-WEEVIL.

A correspondent from Leicester, Mass., recommends camphor against the Pea-weevil. He keeps his Peas together with a lump of the gum in a tin vessel, and finds them all sound at planting time.—[We have tried camphor repeatedly for this purpose without satisfactory results.—Ed.]

A PROFITABLE GARDEN.

As an illustration of how much a small piece of ground can be made to produce, my summer's experience may be of interest.

My garden plat, of a little less than one-quarter of an acre, is a rich, black loam. Its glory were two Mammoth Squash vines, which produced eleven Squashes, of weight as follows: The largest, 142 pounds; the next, 82½ pounds; two weighed 130¾ pounds; two others 91½ pounds; one, 61 pounds; two, 51¼ pounds; and two small ones, not matured, 26 pounds. Total weight of the eleven, 615 pounds.

The remainder of the crops were sixty-five bushels Early Rose and Beauty of Hebron Potatoes, thirty-five bushels Turnips, and some two dozen or more Hubbard Squashes which, at our regular market prices, would have brought the following amounts:

65 bush. Potatoes, at 50 cts.	\$32.50
Mammoth Squashes.	15.00
35 bush. Turnips, at 25 cts.	8.75
Hubbard Squashes.	5.00
Total.	\$61.25

Cost of production:

Seed.	\$5.00
Labor.	6.25
	<hr/>
	11.25

Net profit. \$50.00

Being a profit of two hundred dollars per acre, and this without extra manure or better cultivation than is given to ordinary field crops. As the ground in this case was a formerly unoccupied waste spot of no value whatever, no charge is made for the land.

M. A. AYERS.

SCAB IN POTATOES.

Extensive experiments with remedies for Potato scab have long since convinced us of the efficacy of some special commercial fertilizers, and although the cause of scab is not positively known, its destructions can in most cases be entirely prevented. Recent experiments in this regard, made by Dr. Henry Stewart, Hackensack, N. J., fully corroborate our own experience.

The Doctor writes:

"I have just been digging some of my Potatoes (Early Rose), and send you samples. The clean large one is a fair specimen of some rows manured with the Mapes Potato Manure, eighty feet of row manured with the fertilizer produced one barrel, two and a half bushels. As the rows were three feet apart, the yield is equal to one hundred and eighty barrels, or four hundred and fifty bushels per acre. The other Potato, shown in our illustration, engraved from a photograph, is a fair specimen of those grown with cow and hen manure, yielding a barrel of fair Potatoes to three hundred feet of row, equal to a hundred and twenty bushels per acre. A large quantity, quite a half of this part of the crop, was completely destroyed by wire worms, and not more than half those saved would be fit for sale. Not a Potato, of those grown with the fertilizer alone, is touched by the worms enough to hurt it. I used ten loads of manure to a quarter of an acre and fifty pounds of the fertilizer to one-eighth of an acre."

Strong as this testimony is, we do not wish to convey the idea to our readers that we believe Mapes's Potato Manure, or any other fertilizer we are acquainted with, to be an infallible specific against scab. There may

be certain conditions in some soils and seasons which defy or counterbalance its anti-scab properties to some extent. Yet we have never observed an instance in which, when properly applied, it was not productive of decided benefit. The results of recent experiments made at the "Rural Grounds," where 1048 bushels of Potatoes per acre were grown with an application of 600 pounds Mapes's Potato Manure, while unmaured ground under the same cultivation produced but an average of 200 bushels per acre, are especially notable in this regard.

SCABBY POTATO GROWN WITH ANIMAL MANURE.

DANGERS OF CANNED VEGETABLES AND FRUITS.

Canned goods occupy already so important a place among the industries of our country, and are of so much vital importance to manufacturers as well as producers in many sections, that anything that threatens to diminish their popularity deserves careful investigation.

Two cases of poisoning from the use of such goods have recently come under our personal observation. In one case, canned Peaches, eaten by a strong, healthy boy, produced severe pain, vomiting and diarrhoea; in the other, canned Beans poisoned an entire family, a nursing baby even being affected through its mother's milk. The symptoms were exactly those of poisoning from some zinc or copper salts, and serious results might have followed but for the timely assistance of a physician. In both instances the cans were purchased in small country stores, where they had probably been standing on the shelves for a considerable length of time.

There can be no doubt that the long contact of fruit acids with the metals of which

the solder is composed will gradually produce poisonous salts which, although generally in too small quantities to produce immediately apparent harm, are not without injurious effects upon the health and constitution of those eating them. And the longer and warmer the goods are kept the greater becomes the danger.

Manufacturers should lose no time to find some means for sealing the cans hermetically without the use of substances which endanger the lives of their customers; or laws should be passed to make it obligatory that the year in which the goods are put up be plainly and indelibly stamped on each can. This much, it seems, the people have surely a right to demand as a matter of self-protection.

A RELIABLE SWEET POTATO.

THE EARLY GOLDEN.

Growing Sweet Potatoes very extensively for northern markets, and being particularly desirous of securing an early variety, I purchased in spring, 1881, one pound of *Early Golden* tubers, and bedded them late in April. The summer was very dry, yet I raised a bushel of Potatoes. The following February I bedded them, planted on a quarter of an acre of very poor land, manured with fifty pounds of Kainite, and dug, in October, sixty bushels of large Potatoes, many of them weighing three to four pounds. In February, of last year, I bedded twelve bushels, but owing to the cold and wet spring many rotted in the bed; nevertheless, I planted over three acres. We have had the most disastrous drought I ever knew, and while other varieties of Sweet Potatoes were nearly ruined by the heat and hot winds, my Golden kept on growing. About the first of August, when other varieties were only of the size of hen's eggs, I dug Golden of one and of one and a half pounds in weight. I am satisfied there is no better and more reliable Sweet Potato in the South.

J. H. POWE.

A NEW METHOD OF WATER-MELON CULTURE.

A correspondent of the *Rural New-Yorker* describes the following method by which an extraordinary crop of Water-melons was raised: Holes were dug ten feet apart each way, eighteen inches square and fifteen inches deep. These holes were filled with well-rotted manure, which was thoroughly incorporated with the soil. A low, flat hill was then made and seed planted. When the vines were large enough to begin to run, the whole surface was covered to the depth of a foot or fifteen inches with wheat-straw. The straw was placed close up around the vines. No cultivation whatever was given afterward; no weeds or grass grew. The vines spread over the straw, and the Melons matured clean and nice. The yield was abundant, and the experiment an entire success. This is surely worth trying next year.

VALUE OF MANURE.

"Much has been said of the extent of the commerce of England, with its flags dotting every sea, but the entire value of all her shipping is not equal to the value of the manure applied to the land in any single year." So says Secretary Russell.

The Fruit Garden.

SEASONABLE HINTS.

Marketing Fruits.—A good deal of gratuitous advice is frequently given to fruit-growers about the advantages of home markets. There is no doubt that many gardeners near inland cities and large villages could increase their receipts considerably by creating and supplying home markets, instead of shipping all their crops to the great fruit centers, thereby saving freights, commissions, and various incidental expenses. But it must be borne in mind that in fruit-growing, as in trades, all cannot be retailers. The large cities must be supplied through the agency of those who make a business of selling what others raise and produce.

Selling is as much a business as producing goods, and requires as much, and frequently more knowledge, skill, experience, and capital. The average cost of selling and transporting agricultural and industrial products from the farm and workshop to the hands of the consumer is decidedly greater than the cost of production, and this has to be paid by some one, and some have to be paid for doing the work and incurring the risks of the trade. It is apparent that those who devote all their time to the study of the markets and the securing of customers can sell with less expense and to better advantage than those who carry on another business which requires all their time and thought at the same time. Each one has to decide for himself according to his inclinations and capabilities; but farmers and gardeners can no more dispose of all their crops at retail prices than manufacturers of dry goods and hardware can. Local markets would soon become overstocked and prices dwindle down to nothing.

Home markets offer, nevertheless, excellent opportunities to capable and energetic gardeners if, at the same time, they are good, active salesmen; but these qualifications are not often combined in one person, as rarely, in fact, as men eminent in professions are found to be good business men.

Partnerships.—Unless gardening is carried on at a very small scale, to make home markets profitable there should be two persons interested in the business—one to devote his principal attention to the garden, the other to the sale of the products. We know of several partnerships of this kind which work very satisfactorily.

We are led to these remarks in answer to several inquiries about this subject, and also because the season to commence active operations is already on hand.

Securing Orders.—Those intending to embark in local market-gardening should lose no time to canvass the neighborhood for prospective purchasers, and to ascertain what their probable requirements may be. If definite orders from hotels or large summer boarding-houses can be secured, these alone may sustain a fair-sized fruit and market-garden. But let no one suppose that he can build up a profitable business, if he disappoints his customers and is not able to fulfill his contracts. The hotel-keeper who is left without berries and vegetables, just when his house is most crowded, is not apt to depend upon the local grower again, but will order his supplies from market centers.

SMALL FRUITS VS. TREE FRUITS.

Small fruit culture is on the increase, at the expense of tree fruit culture. The less material in the factory of fruit the less likelihood of damage from weather and animated enemies; that is, the less necessary trunk and the fewer necessary branches the better. It follows that small fruits are safer and more reliable than tree fruits. Culture has developed a large number of enemies of the latter. Fungi, insects, animals, frost, and heat prove injurious to the trunks and branches of trees, impairing their usefulness and cutting short their lives. With the exception of Grapes, the enemies of small fruits are neither so numerous nor virulent. I am inclined to believe that the reason of this is that the culture of small fruits is in its infancy; and the exception which I have noted provokes the proposition that culture may develop enemies of small fruits as damaging as those that now assail tree fruits.

Yet, the fact will always remain that the former will have less wood, bark, and foliage to be molested. On this account, too, the loss of one shrub will be less serious than the loss of one tree, occupying, as it does, less ground, and being the equivalent of less care and labor. Again, small fruits are the least damaged by extremes of temperature. Where it is impossible to make the production of Plums, Pears, and Peaches a success, and an Apple orchard is the price of eternal vigilance, Blackberries, Raspberries, Gooseberries, Currants, etc., successfully resist the weather. On the plains and prairies of our country, comprising the greater part of its extent, where high winds greatly prevail, small fruits are best; for they sustain no damage from the gales that prestrate trees.

They probably require less culture. The pruning of small fruits is not such a serious matter as it is of tree fruits; but the ground which they occupy must receive mere cultivation.

Considering our country as a whole, our small fruits are the greater bearers. With the exception of a few localities especially adapted to the production of some particular tree fruit, as Delaware is of Peaches, the crop of tree fruits is uncertain. The absence of trees on our prairies would indicate that these tree fruits would labor under serious disadvantages; and it is certain that there those fruits cannot be depended upon. Nor is this drawback confined to our prairies. Trees bear every other year; that is, each alternate crop is light, and total failures are not infrequent. During many years employed in the culture of fruits on the western prairies, I have never had a short crop of berries, and very rarely of Grapes; but tree fruits have failed often. In the Eastern States, I have found this phenomenon less marked; but it exists.

The greatest drawback to the culture of small fruits has been the difficulty of marketing and preserving them. But this difficulty has almost disappeared. I do not suppose that it will ever be as easy to handle and preserve small fruits as it is Apples, for they will always lack the firm texture and self-keeping quality. But later ingenuity and experience in the construction of boxes and crates, in the manner of handling, as well as later appliances and means for transportation, have made marketing no serious matter. Fifty years ago, canning fruits was almost unknown; but now it has

assumed such large proportions, is so managed as to retain the flavor so little impaired, and can be done so cheaply and easily, that the preservation of small fruits is a matter as easy as of any tree fruit except Apples—and these can now boast of but little superiority in this respect.

This topic might receive further attention. But I must close, contenting myself with the prediction that in the future the development of the culture of small fruits will far exceed the development of the culture of tree fruits.

JOHN M. STAHL.

RULES FOR NAMING FRUITS.

At the recent meeting of the American Pomological Society, held in Philadelphia, the following rules for naming and describing new fruits were adopted:

Rule 1. The originator or introducer (in the order named) has the prior right to bestow a name upon a new or unnamed fruit.

Rule 2. The Society reserves the right, in case of long, inappropriate, or otherwise objectionable names, to shorten, modify, or wholly change the same, when they shall occur in its discussions or reports; and also to recommend such changes for general adoption.

Rule 3. The names of fruits should, preferably, express, as far as practicable by a single word, the characteristics of the variety, the name of the originator, or the place of its origin. Under no ordinary circumstances should more than a single word be employed.

Rule 4. Should the question of priority arise between different names for the same variety of fruit, other circumstances being equal, the name first publicly bestowed will be given precedence.

Rule 5. To entitle a new fruit to the award or commendation of the Society, it must possess (at least for the locality for which it is recommended) some valuable or desirable quality or combination of qualities, in a higher degree than any previously known variety of its class and season.

Rule 6. A variety of fruit, having been once exhibited, examined, and reported upon, as a new fruit, by a committee of the Society, will not, thereafter, be recognized as such, so far as subsequent reports are concerned.

THE IONA GRAPE.

Wherever climate and soil are favorable to its perfect development, there are but few if any varieties superior to this exquisite Grape, and we are glad to learn through the *Santa Barbara Press* that California grape-growers are gradually discovering its good qualities. It says:

"The most beautiful Grape of the season, for color, taste, grace of cluster, and rich ripening quality, is the Iona. It is a first cousin to the Catawba with an Isabella spice. It is a glowing, translucent garnet, with a purplish bloom, and ought to make a favorite table Grape, as, framed in its own olive-green leaves and tendrils, with yellow Pears for contrast, no prettier center-piece for a dainty lunch or dinner-table could be devised. Only a few of our vintagers as yet have found out how well this Grape does here, but those few are making it a specialty."

CHOICE OF PEACHES.

It is with real pleasure that we see that eminent and venerable pomologist, *Charles Downing*, still take a lively interest in the progress of fruit culture, and the following, contributed by him to the *New-York Tribune*, may serve as a valuable guide to those intending to plant:

"With their sweet, rich, juicy, melting flavor, Peaches are very pleasant to most tastes; some of the varieties, the yellow-fleshed ones in particular, are more or less vinous, which makes them especially acceptable to many persons. Modern facilities extend their season, too, large quantities being preserved each year by drying, evaporating, canning, etc. For marketing fresh, the later kinds are preferred in this locality; but the list I venture to give will afford a succession of crop from the middle or last of July till the 1st of November:

Alexander, or Amsden,
Early Louise,
Large Early York,
Yellow St. John,
George the Fourth,
Early Silver,
Mountain Rose,
Oldmixon Freestone,
Morris White,
Crawford's Early,
Foster,
Wheatland,
Crawford's Late,
Crockett's White,
Stevens's Rareripec,
Stump the World,
Steadily,
Salway.

"The Peach wants good soil and clean culture—two requisites within reach of industry; and must have hot weather—a summer condition which Providence generally supplies. Then, especially if large specimens of extra flavor are desired, there must be judicious pruning of the branches and thinning of the growing fruit. Also, be watchful against the borer, and hope that the mysterious blight of 'yellows' may not come near."

TRAINING TREES.

Many orchardists advocate freedom of growth, especially in young trees. They claim that the tree will naturally throw out the form and amount of growth that the nature of the tree demands in the way of protection, thrift, and productiveness. At first thought, this theory might seem quite plausible. If the line of reasoning here adopted be followed up a little farther, however, an entirely different conclusion is arrived at. If nature set these trees thirty feet apart in an open field, I should say let the tops take care of themselves—and the roots, too, for that matter. But when I take a tree from its native location, and out of its natural protection, I feel that I have incurred a responsibility in the further care of that tree. It must be trained in a way not natural to one in the wild state, but one which will render it more self-protecting in its changed surroundings.

The young Maple in the forest grows tall and slim, because it is protected from the heavy winds by the larger trees surrounding it. There it thrives and grows amazingly; but take the same tree out of its native place, and set it in an open field, with that tall, slim top, and how long would it last? If the top be cut away, and the tree firmly braced, it will usually live and thrive.

Just so we must do with the Apple tree. Its top must be kept down, and trained to protect the trunk as much as possible. This is especially necessary upon the bleak and open prairie, where, at best, timber is not a natural growth.

Much of this work of training may be done in mild winter weather. One should have a clear idea of the form to be reached, and then work to that idea constantly.

An inverted umbrella is a good shape for the head or top of young trees. This form

THE WHEATLAND PEACH.

can readily be reached by heading back and tying down. A free cutting back of the previous season's growth, and especially the upright or leading shoots, tends to form a neat compact head to the tree. Where the limbs are inclined to grow almost directly up, the pruning should be done on the inner side of the limbs, and the outer shoots left to enlarge the top. Many tops are so stubborn in their endeavors to grow straight up, that it is necessary to tie or weight the limbs down.

Any mild day in winter is good for this work. Time enough can then be had to do the work thoroughly and systematically. Each tree should be studied, and treated according to its wants. At the same time all decayed and decaying branches should be taken out, and all crossing limbs wholly or partially removed. One has no idea how much the appearance and thriftiness of an orchard is improved and augmented by this systematic attention unless he has tried it.

Many trees that were running up tall and slim, with no signs of fruiting, are thus brought into good shape and at the same

time induced to fruitfulness. Cutting off the leading shoots tends to develop fruit-buds.

Next summer's crop can be greatly increased and improved by work judiciously performed in the orchard this winter.

W. D. BOYNTON.

MORE GOOD GRAPES.

As some of the readers of THE AMERICAN GARDEN have requested me to extend the list of good Grapes, so as to include also the older kinds, I will name, in addition,

WHITE GRAPES.

El Dorado, full sister to the Lady Washington. To those willing to devote a little extra care it will fully repay in its fine flavor and large cluster.

Lady, Naomi, Irving, Martha, Eva, Prentiss, are all worthy of a place in the vineyard.

Elvira cracks and sets so badly as to be hardly worth cultivating, but it is nevertheless a very good Grape when fully ripe.

Goethe, although late, is a Grape that well pays for the space it occupies.

RED GRAPES.

Delaware, Agawan, Lindley, Massasoit are all standard varieties. *Iona*, one of the best of the whole, is unfortunately only suited for special locations.

BLACK GRAPES.

What shall I say of the *Concord*? It has been a friend long, and has been called the Grape for the million; but, alas! mildew and rot have claimed it, and the truth is that to-day it is one of the most unreliable of all Grapes. However, its last stage is likely to be its best. It is one of the best of stocks on which to graft the more tender varieties. Though the *Concord* may no longer bear *Concords* on its own roots, yet the hybrids, and especially the white varieties, are so much finer when grafted

on it that no one need sigh over its loss.

Barry, Black Eagle, Cottage, Cambridge are all desirable.

Eumelan is especially remarkable as one of the few Grapes that will grow and succeed near the ocean, even where the spray in heavy storms may dash upon it.

Hartford Prolific requires good, rich soil to come to its highest perfection.

J. B. ROGERS.

GROWING HUCKLEBERRIES.

If you want to grow Huckleberries, says W. J. Scott, in the *Husbandman*, set out young plants, about a foot high, in the spring. Mulch them for a year or two, and plow in some coarse horse manure occasionally. They are slow to start, but after they are started they grow rapidly both in bush and berry. The bushes may be cultivated with a horse. They should be set at least seven feet apart each way, as they spread considerably when full grown. It is well to set three or four small bushes in each hill.

The Flower Garden.

THE OPENING YEAR.

When winter winds are piercing chill,
And through the Hawthorn blows the gale,
With solemn feet I tread the hill
That overbrows the lonely vale.

O'er the bare upland, and away
Through the long reach of desert woods,
The embracing sunbeams chastely play,
And gladden those deep solitudes.

Where, twisted round the barren Oak,
The summer vine in beauty clung
And summer winds the stillness broke,
The crystal icicle was hung.

Where, from their frozen urns, mute springs
Pour out the river's gradual tide,
Shrilly the skater's iron rings,
And voices fill the woodland side.

Alas! how changed from the fair scene,
When birds sang out their mellow lay,
And winds were soft, and woods were green,
And the song ceased not with the day.

But still, wild music is abroad,
Pale, desert woods! within your crowd;
And gathering winds, in hoarse accord,
Amid the vocal reeds pipe loud.

Chill airs and wintry winds! my ear
Has grown familiar with your song;
I hear it in the opening year,—
I listen, and it cheers me long.

LONGFELLOW.

SEASONABLE HINTS.

The Study of Catalogues is a most appropriate and seasonable occupation of the present month, and to the real lovers of flowers it affords as much pleasure, almost, as gardening in the ground itself. Seeds-men's catalogues of the present day are not price-lists merely, but some of them are prepared with a great deal of care and skill, and contain more useful and practical information about the cultivation of flowers and garden management in general than is often found in far more pretentious works.

The Selection of Varieties among the thousands named in these catalogues is not always an easy matter to the experienced gardener even, and often one of considerable embarrassment to the novice, especially if he has a fancy for "novelties." To those to whom it is immaterial whether they spend a few dollars, more or less, for their garden, we would say: By all means give a trial to the most "promising novelties." Although it is not likely that all will come up to expectations, some of them will in all probability prove valuable acquisitions, which will pay fully for all expense and watchful care and labor bestowed on them.

Mixed Varieties of the leading species are especially to be recommended to beginners and to those who can devote but a small amount of money for their flowers. As a general rule, these mixed packets contain a few seeds, at least, of all the best varieties of the species, and do rarely fail to give satisfaction.

Bulbs stored in cellars should be examined occasionally, and decayed ones removed.

Tuberous can hardly be injured by being kept too warm, but they should never be exposed to a temperature below 40 degrees.

Tigridias require similar treatment. Great care must be taken to protect them against mice, who prefer them to any other food.

CALADIUMS AND COLOCASIAS.

Both these plants were formerly known as Arums, to which family they in truth belong, and are separated from Arum only by botanical differences which are of little interest to the cultivator. Both are tropical plants, growing in moist situations, developing large foliage in the season of growth, and resting during a portion of the year. It is for the foliage that these plants are grown, the flowers not being especially attractive.

The garden treatment of both is the same. The tubers should be planted in the ground or turned out from pots, in which they have been started in a frame or greenhouse, about the last of May, in a rich, deep soil and in a warm exposure. If the season is dry, as they are naturally marsh plants, they should have liberal waterings. Under this treatment the Colocasias will develop enormous leaves and be conspicuous objects in the garden until killed by the frost. The tubers should then be taken up and stored in a frost-proof cellar until spring.

Although under this treatment we have

COLOCASIA ESCULENTA.

occasionally seen Caladiums do passably well, yet they never attain in this country, out-of-doors, the beauty which makes them so ornamental in the tropics. Here the bright markings of the foliage are dull, the delicate white varieties burn, and the plants do not usually grow vigorously. The midday sun under the equator is not as hot as it is in New-York in summer, and it never has that burning force which here burns, blights, and

TYPES OF CALADIUMS.

parches plants with delicately marked foliage. We have seen acres of the brightest Caladiums, and many of the white foliage varieties, in Brazil and never yet saw a leaf burned. If, however, one will shade his Caladiums out-of-doors from direct sun, he may be successful; but it is in the greenhouse one must look for the best results with these brilliantly colored foliage plants.

The indoor treatment is simply to pot the tubers, in March, in rich soil, give plenty of heat and moisture, shade somewhat to prevent burning, and, when the leaves begin to turn yellow, gradually withhold water to ripen the root. Turn the pots upon their side and withhold water until the plants are again wanted. By successive pottings, plants may be had in perfection the whole year.

As to species and varieties of Caladiums the name is legion, and every year new hybrids are produced. Some have the foliage pure white, others bright red, and there are varieties with every possible markings and marblings of red and white. Any florist's catalogue will describe many, from which a selection can be made at very small cost.

The Colocasia generally grown is *C. esculenta*; the root is edible but is not good, tasting like a flavorless watery Potato. The foliage is dark green, very large, the leaves often being two feet in diameter on tall, stout footstalks. It is one of the most effective plants for sub-tropical gardening, and is especially adapted for the margin of ponds.

It does well and soon attains a large size in any rich soil, but is impatient of drought.

C. odorata is a rare species, growing from three to six feet high, with large foliage and greenish yellow, very fragrant flowers. It is an evergreen, and must in winter be kept in a greenhouse; but it does well in summer, and produces a fine effect planted out in a warm, moist, sheltered situation. The tubers of *C. esculenta* can be bought for a small amount each, but plants of *C. odorata* are somewhat scarce.

E. S. RAND, JR.

STREPTOSOLEN JAMESONI.

This is a native of Central America, and was introduced into Europe about forty years ago by Mr. William Lobb, who sent seeds of it to Messrs. Veitch, of London. But these plants seem to have been lost entirely, and others were recently re-introduced by M. Edouard André. It is a small shrub, three to six feet high, growing wild on the mountains of Central America, at an elevation of from three to six thousand feet. The leaves are of a dark, glossy green, one to two inches long. The flowers grow in terminal panicles of thirty to forty blossoms; they are bright yellow, shading gradually into orange and scarlet; about half an inch across and nearly an inch long. It is a very abundant bloomer, and is easily propagated by cuttings.

The general character of the plant is similar to the Fuchsia. It is splendidly adapted for bedding out, and will make a handsome and highly attractive house plant.

MONFAZIER, France. JEAN SISLEY.

SIX CHOICE GERANIUMS.

Our colored plate, which is mailed free to all subscribers for 1884, represents six new varieties of Geraniums, selected from a large number of seedlings for their excellent qualities both for bedding out and house culture.

Miranda is of compact habit, with delicate pink flowers marked white in the upper petals. *King Lear*, flowers very large, pure scarlet. *Mercurio*, bronzy flesh salmon color, very large trusses. *Shylock*, rich plum crimson with deep purple shades. *Ophelia*, pure white, habit neat and compact. *Darwin*, rich deep purple, with large flowers and trusses.

STATICE SUWOROWI.

Under the name of Sea-Lavender, or Marsh-Rosemary, is known a very ornamental perennial plant, which grows wild in salt marshes along the Atlantic coast, especially southward. Botanically it is *Statice Limonium*. Its graceful, lavender-colored flowers are extensively collected and dried for use in winter bouquets, and several other handsome species cultivated in gardens are used for the same purpose.

Not all *Statice*s are perennial, however, and among the annual species are some of the most charming ornaments of the flower-garden. The most beautiful of all these—even if only half of the praise it has received in Europe is deserved—is *S. Suworowi*. Our illustration gives a pretty good idea of the general habit of the plant. Its branching flower-spikes of bright rose color, shaded with crimson, appear successively, ten to fifteen on each plant, and measure from fifteen to eighteen inches in length. The leaves, which are about five inches long and nearly two inches broad, glaucous and undulated, lie flat on the ground, forming a graceful rosette.

A great merit of the plant is that it continues a long time in bloom, its flowers lasting for two months or more; so that by sowing some seed early in a hot-bed, or in pots in the house, and later in succession in the open ground, plants may be had in constant flowering throughout summer and autumn. The general treatment of the seed and plant is the same as required for most annual flowering plants.

DOUBLE DAISIES.

Our common White or Ox-eye Daisy is a very different plant from the true or English Daisy. The botanical name of the latter is *Beltis perennis* while the former is *Leucanthemum vulgare*.

As in most cultivated flowers, considerable improvement has been made in the size, color, and fullness of the flowers of the English Daisy; and the modern strains of improved varieties deserve more general cultivation than they receive. The principal difficulty in their outdoor culture here is that they do not stand our hot, dry summers, if fully exposed to the sun, and should therefore be planted in some partially shaded, cool place. For the edging of beds and borders in such situations, few plants are more desirable. A rich, loamy, deep soil is best suited for their perfect development. They are propagated by division of roots or from seeds.

The new variety "Longfellow" is especially recommended for growing from seed. Its flowers are of deep rose color, very double, and remarkable for their long, stiff stems, which latter quality is of considerable importance in a bouquet flower. Seed sown outdoors in spring will generally not produce flowers before the following season; but by sowing it in a frame, or in boxes in the house, the latter part of winter or early spring, and transplanting the young plants outdoors at the proper season, flowers may be obtained the same year.

THE CALLIOPSIS.

Last summer I had a circular bed in the garden which attracted considerable attention and afforded me a large degree of satisfaction. The center was a *Canna*—*Marechal Vaillant*, I think,—any way, a strong, vigorous grower, with very large, glaucous green leaves. It sent up half a dozen stalks to the height of four feet, and was a very stately,

STATICE SUWOROWI.

dignified plant. About this I planted *Calliopsis*, with *Master Christine Geraniums*, about a foot apart, in the circle, and outside of this circle I had a row of white *Phlox*, and edged the bed with the low blue *Lobelia*. You see the combination of colors I had—bright rosy pink from the *Geraniums*, among the rich, dark velvety brown of the *Calliopsis*, with the white of the *Phlox* as a

DOUBLE DAISY.—"LONGFELLOW."

contrast, and the blue of the *Lobelias* to set off the *Phlox*.

All of these flowers are remarkably free bloomers, and furnish strong masses of color, and are among our best plants for using where strong effects are desired. The contrast and harmony of the *Geraniums*

and *Calliopsis* was very striking. I have used the latter plant alone with good results in a large bed. The darker sorts have an intensity of color that is velvety in shade and almost fiery in sunshine. The dark sorts are by far the best.

I think excellent effects might be produced by using a pale yellow *Hollyhock*, of the double Chinese varieties, for a center-piece, and planting the mazarine blue *Larkspurs* about it, edging the bed with a two-foot wide circle of the *Calliopsis*. The soft yellow, the rich blue, and the more intense crimson or maroon or black-brown—for it is all these, according to the light you see it in—of the *Calliopsis* would combine most strikingly and effectively.

EVEN E. REXFORD.

CHRYSANTHEMUMS IN POTS.

Although *Chrysanthemums* may be brought to great perfection in the outdoor border, to obtain the largest and best-shaped flowers, most perfect forms and truest colors, and highest development in general, the plants should be grown continuously in pots. *Mr. John Thorpe*, who is probably the most experienced *Chrysanthemum* grower in this country, gives his pot plants the following treatment:

The cuttings or suckers which come directly from the soil are best for propagation. These are taken from the parent plants as soon as they are three to four inches in length. About the first week in March, when probably one-third of the varieties are rooted,—the others being put in as cuttings at this time,—the young plants are potted in three-inch pots in ordinary potting soil. As soon as required, they are re-

potted into four-inch pots in soil to which about a fiftieth part of bone-dust is added. The next shift is into six-inch pots, well drained, and in soil composed of rich turfy loam, with a good sprinkling of bone-dust.

The plants are kept in the house until the first of May, "stopped" from time to time as required, and afterward plunged outside in an easterly exposure. They have to be kept carefully watered all the time, and given occasional soakings of guano water—one ounce of guano to three gallons of water being a good proportion. By the first of June all are potted into their blooming pots, stopping and tying the shoots as required.

From the beginning of July until taken in the house in October, they have to be watered several times a day, every two or three hours sometimes; and this, although expensive, is absolutely necessary for the production of the best developed flowers. The last "stopping" is made during the last week in July.

The *Chrysanthemum*, although more exempt from insect enemies than almost any other genus of plants, becomes sometimes infested with black aphides, which may be easily removed by fumigation in the house, or by sprinkling the plants with tobacco dust, if outdoors. The white and black thrips are also troublesome occasionally, but yield to the same treatment and plenty of water.

The Window Garden AND GREENHOUSE.

SELECTION OF HOUSE PLANTS.

Select fresh, healthy plants for winter culture, for they will repay all the labor you bestow upon them by bright flowers. The old Geraniums, Heliotropes, Fuchsias, etc., which have flowered all summer, will be of no value for window gardening, while young plants will soon be covered with buds and flowers. Small plants in small pots are far more desirable for house culture than large plants in such cumbersome pots that it requires a man's strength to move them.

There are several winter flowering Fuchsias which will continue to bloom from October until May, in beautiful luxuriance, if you will only give them a spoonful of "Soluble Pacific Guano" once in two or three weeks, or give it in a liquid form by dissolving a table-spoonful of it in three quarts of hot water. It will also destroy the white worms which are so apt to infest the soil of plants that have not been repotted frequently. At least, it proved an antidote with me last season. But if it does not exterminate them, take a piece of unslacked lime as large as a man's fist, and slake it in hot water in an old pail, and when the lime has sunk to the bottom, water the plants with it, and it will make their foliage luxuriant and destroy worms of all kinds. The lime can be used over several times.

Tea Roses, if well treated, make lovely plants for winter. Purchase well-rooted plants of *Bon Silene*, *Safrano*, *Bella*, and other varieties, and put them close to the glass and stimulate weekly with weak liquid fertilizers; or a *Jacqueminot* Rose which bloomed in the summer may be taken up and potted in an eight-inch pot, with the richest compost made friable with sand or sharp grits; cut back all the old wood and pull off every leaf and place it in a frost-proof window, but where the sun shines in well, and you can force as handsome rose-buds as the florists.

For a small amount of money a collection of winter-flowering plants can be procured; and though they will neither feed nor clothe the body, yet they will minister to the needs of the soul, which sometimes hungers, thirsts, and shivers, while the body is luxuriously fed, and clothed in fine raiment.

DAISY EYEBRIGHT.

A CHEAP HEATING APPARATUS.

We have occasional "cold snaps" here in South-eastern Tennessee, when the temperature goes down to zero. So pits have to accommodate the greenhouse plants; but as soon as those are cared for, human nature wants winter bloomers, and a greenhouse with a stove becomes necessary. I have a modest attempt at such a building, 13 x 6 lean-to, being the end of a "poreh" or "veranda."

It is heated by a remarkably cheap and effective apparatus. I secured an old coil discarded from the blast-furnace here at scrap price. The coil is of inch iron pipe, and is 18 inch diameter, and has four turns. Originally, it had several more turns, but they leaked, so I cut out the sound portion. The grate is 8 inches in diameter. The pipe is built in and carried up to 2 feet 6 inches

high from grate, so as to form a fuel chamber above the flue, as shown in our illustration. The upper end of the coil forms the flow and the lower the return. They are conducted into a zinc-lined tank 12 feet long, 20 inches deep, and 12 inches wide, running under the front bench. [The suggestion of R. Cole in your October number, that "if the supply-pipe is carried to the extreme end of the tank, the water will be kept in constant circulation," is a purely theoretical one, for if the return-pipe is taken from the bottom of the tank, and the flow put in just under water level at the top, the hotter water will float on the cooler water in the most perfect way. Plunge your hand, as I have done since writing the above, into the water after

the fire has been lit an hour; try it with the thermometer 108° Fahr. on the surface; at 6 inches depth the water begins to fall, at 7 inches depth it is 60° Fahr.]

Our tank holds over 100 gallons, and the night before, when the thermometer outside stood 18° Fahr. and a stiff north wind blowing, the fire was lit at 4.30 P. M. and never looked at till 9 A. M. next morning—Poinsettias, Coleus, and similar tender plants all right. The fuel used are coke screenings, which here and at all furnaces using coke are thrown away—so cost only hauling.

The cost of the entire arrangement is as follows:

Plank and zinc lining	\$10.00
Piping and fittings	4.00
Brick work	4.50
Labor in fitting up	5.00
Extras, say	1.50
Total	\$25.00

The labor necessary for the maintenance of the fire is but a minimum, and the heat is steady and reliable enough for ordinary purposes.

The cost of fire per day is one bushel braise, costing two cents hauling. Can any one beat that?

WM. M. BOWRON.

ALLAMANDA.

A genus of beautiful climbing shrubs, natives of Central and South America. They have mostly rich golden-colored flowers, which are very showy. A large, well-flowered plant, being a splendid sight when well trained, either on a flat trellis, or in a pyramidal form. To start in the spring they require a warm temperature, which should be given not later than March, so that their growth may commence sufficiently early to produce flowers as soon as possible, it being on the points of the young shoots that the flowers are produced.

A soil composed of equal parts of good fibrous loam and leaf mold, with a sprinkling of well-rotted manure, is most suitable. As the plant requires an abundance of water during its growing season, thorough drainage, to allow the water to pass off freely, is a necessity. In fact, all plants of a strong, vigorous nature which require an abundance of water at the roots should be well drained; it is imperative for their health that the water passes off freely. A plant can scarcely get too much water if well drained; but if at fault in this respect, the roots may get completely destroyed in a short time.

The no-drainage system in the culture of plants is only suitable with small plants growing in small pots, and in these only for a short time. All plants which are to remain for any length of time in the same pots, unless well drained, will soon show the bad effects unless considerable care is taken in watering.

I believe in pressing the soil around the roots of the Allamanda as firmly as possible. Unless this is done, the flowering season is not so long, nor are the flowers so numerous. After potting, place in the warmest part of the greenhouse, freely use the syringe overhead to encourage growth and prevent insects. Train the shoots as they grow into some suitable form and in such a manner as to present the most pleasing effect. For an exhibition plant, the pyramidal form is the most appropriate, as it shows the flowers to the best advantage. Toward fall, when the plant becomes exhausted and the flowers are less abundant, lessen the water supply gradually, and ripen the wood as well as possible, after which the plant may remain in a greenhouse until starting time, with just sufficient water to keep the wood from shriveling.

A. Hendersoni is the most handsome species in cultivation. It is not such a straggling grower as some other species; its flowers are of a rich, deep orange color, produced in great abundance. Young plants, when well cared for, bloom freely.

A. Schottii is a strong growing kind, producing large, bright yellow flowers. The growths of this species, when young, should be pinched back, which gives a more compact habit to the plant.

A. nerifolia. The hardiest species of the genus, a native of Brazil, of a bushy habit, producing a panicle of deep yellow flowers, not only from the end of the shoots, but also from the laterals. The individual flowers are not so large as the aforementioned kinds, but more numerous. It is a plant well worthy of being in every collection, and never fails to excite admiration.

All delight in a warm, moist atmosphere, and are propagated by cuttings.

M. MILNE

CHENOSTEMMA HISPIDA.

Among the many desirable plants recently brought to notice, the *Chenostemma* deserves a prominent place, and although not new to botanists, its good qualities as a house plant seem to have been strangely overlooked. The flowers are star-shaped, pure white, about a quarter of an inch in diameter, and borne in so great a profusion as to completely cover the small, bushy plants. It is an almost continuous bloomer, admirably adapted for the window garden, as well as for growing in vases and baskets outdoors in summer.

HOW NEW ROSES ARE PRODUCED.

"Where do the new Roses come from? Who discovers or makes them? If they are made, how are they made? Does it pay to make them? What is the reason that of late years Roses generally seem to be getting larger than they used to be?"

These and several other related questions were asked of a prominent florist, and thus reported to the *New-York Sun*.

"New Roses," he replied, "come from England and France mainly, although some are produced in other European countries, and a few, very few, may claim to be American. When you see a Rose that you have not been accustomed to seeing, it is by no means safe, however, to assume that it is an altogether new one. It may be simply one that has disappeared from public view for a number of years, and during that time has been kept in existence by some individual grower who has had a particular liking for it. Look at the *Bon Silene* and the *Niphotos*, for instance. Both are old Roses. The first-named was once discarded in this country, and went entirely out of popular knowledge for fifteen years. When it re-appeared it came from France to Boston, thence to this city, and from here spread everywhere. It is now a generally popular favorite. It is not large, but its buds are perfectly formed, and it has a charming tint.

"The long, white, beautiful buds of the *Niphotos* were grown here forty years ago, but, through some chance, nobody seems to know exactly how, the variety became entirely lost, and twenty years elapsed before it re-appeared. When it did re-appear it was introduced into the trade in France by a man named Granger. Where he got it is a mystery. He called it by its original name, but claimed that it was an entirely new Rose.

Old growers, however, knew it was not new. It is universally admired; and now that we have learned far more than we used to know about the cultivation of this sort of Roses, gardeners find it a profitable variety. It requires a great deal of heat all the time, and it is difficult to bring it into fine bloom unless it is humored in every way.

"But you ask me how new Roses are made. They are grown from the seed. Patient men, with a mildly speculative bent of mind, in France and Germany, give their whole minds to it, and their work begins even before the formation of the seed. To explain: The large new Roses are technically known as 'hybrid perpetuals,' and are crosses between, or descendants from, the hardy June Rose and certain varieties of the remountant Reses. The remountants are those

perfect as can be selected of the hardier variety, and the seed from the impregnated flower is carefully saved, and, in due time, sown.

"Acres upon acres the grower fills with the experimental plants that spring from these seeds, which occasionally reproduce the parent plants, but are far more likely to develop into an infinite number of varieties, good, bad, and indifferent. These young plants have to be carefully tended for three years before it is known what they will be. Then, if the grower gets two or three new varieties that are really fine, he is content; and if he obtains half a dozen he considers himself in great luck for getting so many out of 10,000 seedlings, to which he has given three years of patient care and skillful cultivation. The remaining 9994 are only

brush, fit merely to burn. Sometimes, when they are all in bloom, he sees that he might just as well burn the whole 10,000; but that is exceptionally bad luck. He ought to get one out of the lot, anyway. Suppose that he does—the work has just begun. In order to get back his investment in the experiment and make anything by it, he must have 5000 or 10,000 plants ready to throw upon the market at once. Then he springs his new Rose as a surprise upon the trade, and it commands good prices.

"All these plants must be produced from his one solitary little seedling. It has to be kept in constant heat in the greenhouse, its rapidly making new wood being snipped off and propagated as fast as possible, and the plants so produced being used to start others, and so on for two years before the discoverer of the new Rose can venture to say to the public, 'How do you like my new beauty?'

"But, even then, do not suppose that the subsequent cultivation of that Rose is all plain sailing. Many Roses that have been great successes in England and France have been entire failures over here, the

CHENOSTEMMA HISPIDA.

commonly and incorrectly known as monthly Roses. They are not monthly, any more than their children are perpetual. Their French name signifies remounting, or continuing to ascend, and is given to them from their habit of sending up new shoots and putting forth new bloom almost continuously through a great part of the year, without any definitely prescribed flowering season. The flower of one of those Roses—a choice one, ripe, fully open, and perfectly developed—is used to impregnate another Rose, also as

great change in climatic conditions preventing their development. Very often they will not bloom at all here, or, if brought to flower, the result is so bad that it does not pay to cultivate them. But this cannot be determined until after two years of trial. No prudent gardener would discard a plant because it failed the first year. It must get acclimated. Then the development of the second year may be just enough to encourage him to give it a third year's trial; and, after all, it may turn out to be useless."

Lawn and Landscape.

PROSPECT PARK.

(For Plan, see Title-page.)

About two miles from the City Hall or true center of Brooklyn, Long Island, and a half hour's ride by the horse-cars from the principal ferries of that city, is situated a pleasure-ground which in some respects we may term the most noteworthy in America. Prospect Park with its five hundred acres is by no means the largest or most elaborate place of public resort in the country, but it has this one distinguishing characteristic above all other parks in that it realizes in the highest degree the true pastoral idea, the embodiment of which gives the old English lawn its special and peculiar charm.

The main approach to Prospect Park is perhaps the most artistic feature it possesses. A great oval paved space of ten acres, called the Plaza, and situated at the junction of Flatbush and Ninth avenues, introduces the visitor at once to the most agreeable and impressive portion of the park. Embracing from its high point of vantage a comprehensive view of Brooklyn for miles, the effect of this Plaza is greatly enhanced by the character of its boundary lines, which consist of several mounds twenty-five feet high, covered with choice Evergreens. It is curious to note how, with all their actual artifice, these mounds impress the observer as genuine bits of the natural formation of the region. In the center of the Plaza is a colossal fountain and statue of President Lincoln.

Passing through this noble vestibule, distinguished alike for amplitude, symmetry, and dignity, we enter upon the area of the park itself. Our space does not, of course, permit us to describe in detail the many features of interest that meet one at every turn throughout the intricate maze of six miles of carriage drives and eleven miles of foot-paths, but we will consider briefly a few of the more important and attractive points.

As we enter and saunter along the west side of the park, we find ourselves completely shut out by trees and shrubs from Flatbush Avenue, a few yards away. The sense of the close neighborhood of the city is still farther eliminated by the natural woodland appearance of the system employed in arranging the trees and shrubs. A short distance from the Plaza, a glimpse through an archway under the main drive, evidently placed at precisely this point for a distinct purpose, reveals a great far-reaching sweep of undulating meadow fringed by remnants of an original forest of Oak, Elm, and Chestnut. This green or Long Meadow, as it is called, consists of not over twenty-five acres of open grass space; but its natural hills and hollows have been managed so as to give, through our peep-hole of archway, the impression of an unbroken perspective of miles. This feature is the most important in the park; for, without a single carriage road, a field of ample dimensions is offered for the illustration of the pastoral idea.

"Thousands of people," says the "Report" of the landscape architects, "without any sense of crowding, stroll about the level or undulating, sunny or shady turf spaces that are to be found in this strip of pasture or woodland." Here, as elsewhere, the original

features are not only strictly adhered to, but actually intensified by raising the hills with soil and trees and deepening the hollows. Old forest trees are generally throughout the park carefully preserved.

Passing on by a deep dell where a small pool and steep hill-side are beautifully ornamented with choice specimens of rare trees and shrubs, and where the water and open ground are arranged specially for the amusement of children, we come by devious ways past a deer paddock, protected by a sunken moat and fence, to an important region of the park.

Here we find, on the borders of a lake of sixty acres, an open space finely decorated with carved stone balustrades and vases. Within this space grow some of the best trees and shrubs of the park, choice Elms and Maples from Japan, America, and Europe, and on the hill-side, remarkable specimens of Rhododendrons and Conifers from all parts of the world. It may be truly said that some of those Conifers, Silver Firs, and Arbor Vitæ, are hardly equaled by those of any other lawn in America. The spot is, moreover, so fortunately protected from cold winds, by embowering hills, that Evergreens which usually fail north of Washington and Virginia are here found in perfect health and vigor. Cannas, Colocasias, and other tall-growing foliage plants, tastefully arranged, thrive vigorously and produce a rich tropical effect. A rich display of bedding plants, Coleus, Geraniums, Salvias, Alternantheras, etc., is presented at this point year after year in connection with the refectory and shelter, which are perhaps the most ambitious architectural structures of a park where the pastoral idea of wide-spreading turf and woodland is intended to be everywhere dominant.

Passing under an archway and down by a lovely pool where stands the skate-house in winter, we come to the grove where the band discourses sweet music in summer, and so on, past wide meadows and bold hill-sides clothed with fine Evergreens, to Lookout Hill, the highest point in the park. From this point the eye wanders over a distant view of the ocean on one side, and on the other over the great city of Brooklyn. The same sense of largeness of design accompanies this outlook that is felt in considering the general treatment of the park, whether the subject be meadows, trees, or water.

Turning our faces toward the main entrance and Plaza, we pass through a lovely ravine with picturesque masses of rock covered with Rhododendrons, Evergreens, and vines, and on by a quaint dairy-house and restaurant embowered in charming masses of the Japan Ivy or *Ampelopsis tricuspidata*. Not far from here, across the Long Meadow, we meet numerous groups of the grand old native forest trees that have here as elsewhere been carefully and judiciously preserved, and frame so beautifully the open grass spaces of Prospect Park.

We might ramble, indeed, for hours over the walks and drives of this noble pleasure-ground and find charming near and distant landscapes at every turn, but the longer we ramble, the more surely we arrive at the conclusion that, for attractive open spaces of greensward and valuable specimens of rare and choice trees, Prospect Park must bear the palm over all other parks in America.

S. PARSONS, JR.

Horticultural Societies.

NEW-YORK HORTICULTURAL SOCIETY.

The "Show of Floral Designs and Decorations," held on the 4th and 5th of December, was in its way as great a success as the "Chrysanthemum Show" of the previous month, and as a whole was the best and most remarkable exhibition of this kind we have ever seen. Think of it,—an exhibition of floral designs without a single actually hideous exhibit! Who ever heard of such a thing? Moreover, that among the many hundreds of designs there were but very few which did not produce a pleasing effect, may be considered highly complimentary to the good taste of the New-York florists. In the limited space at our disposal, it would be impossible to describe even the best pieces only of each class; so we have to confine ourselves to the most prominent ones of the whole.

The "Dinner-table Decorations" attracted probably the largest share of admiration, although to our mind better taste was displayed in the arrangement of the baskets and trays. The fruit prize of \$100 was awarded to Hanft Bros. The table was circular, about eight or nine feet in diameter. In the center was a large circular bed of La France Roses; radiating from this were five arms in the form of rose-leaves, representing flower-beds. Four of these were thickly dotted with Roses, one kind to each bed, viz.: General Jacqueminot, Niphetos, Maréchal Niel, Catherine Mermet, and the fifth contained a great variety of choice Orchids. Around all was a heavy, rounded band of Firebrand Carnations, and all intervening spaces were filled in with fresh, smooth rock moss. A ring of about a foot in width was all the space left for the service proper, consisting of twelve plates with full appointments. A corsage bouquet of one kind of Roses was placed on the plate for each lady, and a button-hole bouquet of the same kind of Rose on the plate of each gentleman. The flowers employed were of exquisite beauty, and the general effect was very striking. Yet we should think that during the hours of an elaborate dinner it would become somewhat monotonous. The greatest merits of the arrangement consisted in the excellence of the flowers and from the view of utility, in that its highest point was raised but a few inches above the level of the table. Some of the competing designs, although more tasteful in their general arrangement, were so high and massive as to completely hide one's opposite neighbor, which, under circumstances, might spoil all one's pleasure of the entertainment.

The decoration which to our taste would have been the best of all, but for the unfortunate circumstance that it was placed on so small a table, or so small a table under it—we could not tell which—as to completely spoil its effect. On a table half as large again it would have been perfectly charming. Its main design consisted of a bank of Selaginellas running through the middle of nearly the entire length of the table. In the center was a graceful specimen Tree Fern, *Alsophila Australis*, surrounded with various foliage plants. At each end of the bank was a graceful group of Begonias and small Ferns, and midway between these

and the center-piece were elegant groups of La France Roses. We hope the artist who displayed so much taste in this arrangement will try his hand again under more favorable circumstances.

Among the plateaus and baskets were several of exquisite taste and graceful arrangement. A basket of about three feet in diameter was filled mainly with Maiden-hair Ferns, interspersed with a hundred more or less beautiful Catherine Mermot Roses, and edged with a rayed circle of a great variety of rare and brilliant Croton leaves. The effect produced by this simple arrangement was exceedingly pleasing.

The bouquets, of which there were a great many, of all styles and for all purposes, were almost without exception very tasteful. Most of them contained only one or two kinds of flowers in combination with Adiantums and *Asparagus plumosus*. The nondescript indiscriminate flower mixtures, formerly called bouquets, seem fortunately to have been discarded by the New-York florists—forever, we hope.

Of funeral designs there were the usual assortments of crosses, sickles, clocks, altars, lyres, broken wheels, etc., etc., many of which found enthusiastic admirers; but we must confess our inability to sufficiently appreciate this style of decorative floral art. We must except, however, a slanting cross of about four feet in height, the body made of Camellia leaves, and the stem and arms gracefully entwined with a loose wreath of Maiden-hair Fern, interspersed with Roman Hyacinths. This simple design was so inspiring and touching, that if sympathy and love can be expressed in leaves and flowers—we thought—this unpretending cross came nearer to the embodiment of the most tender human sentiments than anything we have ever seen before. Another similar and hardly less effective and chaste cross was made of Ivy leaves and overhung with a wreath of Maiden-hair Ferns, Callas, Lilies of the Valley, Roman Hyacinths, Violets, and Roses.

Many other really meritorious designs, as well as the grand exhibits of Roses and cut flowers, have to be left unmentioned; but in closing, we cannot omit to tender our congratulations to the New-York florists, as well as to the officers of the society, for the unparalleled success of this exhibition.

MISSISSIPPI VALLEY HORTICULTURAL SOCIETY.

The fifth annual meeting of this society will be held in Kansas City, Mo., from the 22d to the 25th of January, 1884. A rich intellectual treat may be expected by all present, and that the occasion will be pleasant and enjoyable as well, no one who has attended a meeting of this excellent society will doubt for a moment.

NEW JERSEY HORTICULTURAL SOCIETY.

This flourishing society will hold its annual meeting on January 22d and 23d, at Camden, N. J. The place of meeting being right in the heart of the great fruit farms and market gardens of New Jersey and Pennsylvania, a large number of prominent horticulturists will be present, and a most interesting session may be predicted. Circulars may be obtained by addressing Secretary E. Williams, Montclair, N. J.

Obituary.

DR. LOUIS E. BERCKMANS.

On the 7th of December died, at the venerable age of 84 years, at Fruitland, Augusta, Georgia, Dr. Louis E. Berckmans, father of the celebrated horticulturist, Hon. P. J. Berckmans, First Vice-President of the American Pomological Society.

Dr. Berckmans was a native of Belgium, coming to this country in the early prime of manhood. He first resided at Plainfield, N. J., where he built up a beautiful place, removing later to Georgia, on account of his failing health. He settled at the charming place now owned by his son, where he established the famous Fruitland Nurseries, and from where, a few years ago, he moved to Rome, Ga., to spend his remaining years in quiet and retirement. He was a man of rare ability, extraordinary attainments, and highest moral character. His scientific training and comprehensive mind led him at an early age to the study of natural sciences and fine arts, and his love of the beautiful in nature inclined him to the pursuits of horticulture and especially pomology. He was intimately acquainted with all the prominent horticulturists and scientists of his time, and those who knew him best loved and admired him the most. No one has done more for the horticultural development of the South than he.

With the death of Dr. Berckmans, his State and the entire country loses one of its most distinguished and honored citizens, of whom it can be said in truth that, through his own work and example, he left the world better than he found it.

To his son, our dear friend, and his family, we extend our heartfelt sympathy, and although well aware that words can offer but little comfort in the hour of bereavement for the loss of such a father, whose mortal form is laid to rest forever, there is some consolation in the assurance that his great legacy to his fellow-men—his glorious work, his noble deeds—has left its indelible impress upon this and future generations.

Miscellaneous.

PEPPERMINT OIL.

The annual production of Oil of Peppermint throughout the world is estimated at about ninety thousand pounds, two-thirds of which is produced in Wayne County, N. Y., where over three thousand acres of land are devoted to Mint culture. The State of Michigan furnishes the next largest product, and recent attempts to grow Mint in Mississippi have proved highly satisfactory.

to THE AMERICAN GARDEN for 1884. Each number will be worth the cost for the entire year, and in no easier and cheaper way can you keep posted on what is going on in the horticultural world.

"NIL DESPERANDUM."

There's never a day so sunny
But a little cloud appears;
There's never a life so happy
But has its time of tears.
Yet the sun shines out the brighter
Whenever the tempest clears.

There is never a garden growing
With Roses in every plot;
There's never a heart so hardened
But it has one tender spot,—
We have only to prune the border
To find the Forget-me-not.

There's never a sun that rises
But we know 'twill set at night;
The tints that gleam in the morning
At evening are just as bright;
And the hour that is the sweetest
Is between the dark and light.

There's never a dream so happy
But the waking makes us sad;
There's never a dream of sorrow
But the waking makes us glad;
We shall look some day with wonder
At the troubles we have had.—*Ex.*

THE HUSBAND'S OPPORTUNITY.

It is doubtful whether the male head of a family often appreciates the opportunity he has for diffusing sunshine at home, or comprehends how much of gloom he can bring with him in a troubled face and moody temper from the office or the street. The house mother is within four walls from morning till dinner-time, with few exceptions, and must bear the worriments of fretful children, inefficient servants, weak nerves, and unexpected callers. And she must do this day after day, with monotonous regularity. The husband goes out from the petty details of home care; he meets friends; he feels the excitement of business competition; he has the bracing influence of the outdoor walk or ride. If he will come home cheerful and buoyant his presence is like a refreshing breeze. He has it in his power to brighten the household life and add to the general happiness in a way that no man has the right to forget or neglect.—*From "Home Brightening" in Outing.*

NOTICES OF THE PRESS.

THE AMERICAN GARDEN, always attractive, is made unusually so in its new cover and by a full-page colored illustration—the latest and handsomest. THE GARDEN is rapidly gaining in America the honored position held by its London namesake in England.—*New England Homestead.*

THE AMERICAN GARDEN, published monthly by B. K. Bliss & Sons, of New-York, improves with each number. It fills a blank long felt by those who cultivate the earth for its fruits or its flowers and gives practical information of great value.—*Boston Journal.*

ONE of our best Eastern exchanges is THE AMERICAN GARDEN of New-York. It is replete with useful information, much of which is suited to all sections of the country, even this far-away Pacific slope.—*Riverside (California) Press and Horticulturist.*

THE AMERICAN GARDEN contains a large collection of choice articles for the florist, vegetable gardener, and the general horticulturist. It is an ably edited, valuable periodical, always reliable and useful.—*Republican Standard.*

THE AMERICAN GARDEN is one of the neatest and most practical amongst our exchanges. There is an air of thoroughness about it that we like.—*Agricultural Epitomist.*

THE AMERICAN GARDEN.—This handsome gardener's magazine continues to please all its many readers.—*Feathered World.*

OUR BOOK TABLE.

Agriculture and Industry will be the title of the consolidated Agricultural Review, De Bow's Review and Southern Industries. It will be published monthly, and simultaneously from New-York, Washington, and New Orleans.

Massachusetts Horticultural Society.—The weekly bulletins of this model society have made their re-appearance, and are heartily welcomed to our table. The first one contains an excellent essay on "Hedge Plants and Hedges," by J. J. Thomas.

The Rural New-Yorker has reached an enviable position among the agricultural journals of America, and in many respects occupies to-day an eminence never before reached by a publication of its kind. It not only gives its readers all the information obtainable from the most reliable sources and the best writers in the land, but also the results of its own extensive and carefully conducted Experimental Farm.

The Continent, now our near neighbor, continues to be acknowledged the model weekly magazine of America. Although it has already reached so high a degree of excellence that improvement seems almost impossible, every number has some articles and illustrations which excel anything that appeared before. Dr. Henry C. McCook's "Leaves From the Note-Book of a Naturalist" alone are worth the subscription price for a whole year.

George W. Collings' Directory of the Agricultural Implement Manufacturers and Dealers in the United States, published by the Baker-Collings Co., Chicago. This handsome, substantial volume of over two hundred pages, contains a complete list of all dealers of agricultural implements, alphabetically arranged by States, and a separate list of the manufacturers. The arrangement is so excellent that any address may be found in a moment. To any one connected with this great manufacturing industry, or to advertisers desiring to reach this trade, the book is invaluable.

ANSWERS TO CORRESPONDENTS.

Killing Mice.—P. J., Halifax, N. S.—We have tried various methods for ridding frames and borders from mice, and find the "Poisoned Wheat," or "Mitchell Wheat," sold generally in drug-stores, the easiest and most convenient exterminator. All that is necessary is to drop a few grains in their burrows.

Lye Wash for Fruit Trees.—Rev. J. R. L., Orange Co., N. Y.—One pound of commercial potash to four gallons of water is the usual proportion for this wash. It should be applied with a brush or swab just before a rain. For cleaning Orange trees from scale insects, considerably stronger solutions are used without injury. We concur in your high opinion of the value of wood ashes.

Forcing Lilies.—C. F. D., New Haven, Conn.—Different species of Lilies do not force with equal facility, and each kind has to be treated according to its specific nature. The Bermuda Easter Lily and all varieties of Lilium longiflorum force very readily and much quicker than Japanese Lilies. All should, however, be given time to make roots before bringing them in a forcing temperature. The bulb alone cannot supply the necessary food for the plant and flowers.

Cold Grapery.—M. T. G., Yarnouth, N. S.—When it is not desired to have ripe Grapes very early, artificial heat is not necessary in a grapery. The cost of building a grapery varies in different localities, and according to the degree of finish desired. A modest structure could be erected for about ten dollars per running foot, perhaps less even, up to almost any amount. During 1883, several exhaustive articles on this subject appeared in THE AMERICAN GARDEN, which contain all the desired information.

Transplanting Trees in Winter.—Mrs. J. P., St. Louis, Mo.—It is hardly worth the trouble to transplant young Maple trees with a frozen ball of earth. They will do fully as well when transplanted as early in spring as the ground permits. The young branches should be cut back about one-half, and so on to give the tree a good shape. The cutting off of the entire top is, to say the least, a questionable practice. Of course, care

should be taken to mutilate the roots as little as possible in taking them up, and to make a sharp cut wherever they become broken or lacerated.

The "Desk Tool," manufactured by the celebrated advertising agents Lord & Thomas, Chicago, is about the most convenient and neat combination of a type measure, ruler, and checker that can be imagined. It costs only ten cents; but after having used one for about a week, we would not take a dollar for it, if we could not get another one.

Literary Note.—E. P. Roe, of whose novels over four hundred thousand copies have been sold, and who is well known to horticulturists as a fruit-grower, is now writing what may be called a farmer's novel in Harper's Magazine. "Nature's Serial Story" is the romance of a country home, with pictures of farm and country life by Gibson and Dielman. It began in the December (Christmas) number.

Kemp's Manure Spreader, manufactured by the Kemp & Burpee Mfg. Co., Syracuse, N. Y., and advertised in our advertising department, is one of the most valuable labor-saving implements ever invented. It not only does the work of many men with as much ease as water runs from a sprinkling cart, but it also enhances considerably the value of the manure, on account of its being much finer and more evenly spread than is possible by hand.

Freeseas, about the valuable qualities of which we have spoken in previous numbers, are rapidly gaining deserved recognition. Mrs. Wood, of West Newton, Mass., who with her two sons favored us with a visit, and kindly placed a bunch of flowers upon our table, informs us that Freeseas are already in great demand in Boston, and that they are just being introduced by the New-York florists. From what we have seen of the flowers we consider them remarkably adapted for floral work of various kinds and shall not be surprised to see them soon take their place among the most fashionable flowers.

To Hit the Mark.—Whether the target we aim at is a target which stands still, or a living creature which is doing its best to get away, there is no use in trying to do accurate work with inferior weapons. In the guns of J. Stevens & Co. we find the most superior workmanship and the most excellent methods of construction. Whether for purposes of marksmanship or for taking game successfully, these arms are all that can be desired. The most experienced sportsmen testify with pleasure the high estimation in which they hold these weapons. The prices of the J. Stevens & Co. arms will be found acceptable to all who know how to appreciate a good article of gun or pistol. Their Illustrated Price List is mailed, post-paid, upon application.

IMPORTANT.

When you visit or leave New-York City, save Baggage Expressage and Carriage Hire, and stop at the Grand Union Hotel, opposite Grand Central Depot. 600 elegant rooms, fitted up at a cost of one million dollars, reduced to \$1.00 and upward per day. European Plan. Elevator. Restaurant supplied with the best. Horse cars, stages, and elevated railroad to all depots. Families can live better for less money at the Grand Union Hotel than at any other first-class hotel in the city.

BRAIN AND NERVE FOOD.

FROM THE NERVE-GIVING PRINCIPLES OF THE OX-BRAIN AND WHEAT GERM.

Vitalized Phosphites.—Restores the energy lost by nervousness, weakness, or indigestion; relieves lassitude and neuralgia; refreshes the nerves tired by worry, excitement, or excessive sensitiveness, and strengthens a failing memory. It aids wonderfully in the mental and bodily growth of infants and children. Under its use the teeth come easier, the bones grow better, the skin smoother, the brain acquires more readily and sleeps more sweetly. An ill-fed brain learns no lessons, and is peevish. It gives a more intellectual and happier childhood. Not a secret remedy; formula on every label. For sale by Druggists, or mail, \$1. P. Crosby & Co. 664 & 666 Sixth Ave. New-York.

Take Notice.—For fifty cents (in stamps), two hundred elegant Scrap Pictures. No two alike. F. Whiting, 50 Nassau street, New-York.

Advertising Department

To every Yearly Subscriber to

The American Garden,

A MONTHLY ILLUSTRATED JOURNAL, DEVOTED TO THE GARDENING INTERESTS OF AMERICA.

ONE DOLLAR A YEAR.

Specimen Copies, free.

VALUABLE PREMIUMS

In clubs of six for one year.....\$5.00
" " ten " " " " " " 7.50
Additional subscribers in clubs over ten, 75 cts. each.

This elegant and richly illustrated journal,

Edited by Dr. F. M. HEXAMER,

contains twenty large pages of closely printed matter relating to the Vegetable, Fruit, and Flower Garden, the Lawn, Greenhouse, and Window-Garden, Rural Life, Sanitary Improvements, and all branches of Horticulture in its various departments. Volumes commence with the January number, and it is desirable that subscriptions should begin with the first number of the volume, although they may be entered at any time for a year from the date of entry.

BOUND VOLUMES.

Volume III. (1882) and Volume IV. (1883) have been carefully indexed, convenient for ready reference, and bound in handsome heavy paper covers. The amount of useful, practical horticultural information contained in these volumes cannot be obtained in any other books for the same price, making them most valuable additions to any library. Price, \$1.00 each by mail, post-paid, or

Free as a Premium

for a club of four at \$1.00 each, without single premiums to the subscribers; or free to the sender of a club of ten at seventy-five cents each, entitling each member of the club to a premium the same as those subscribing singly.

A PREMIUM FOR EVERY SUBSCRIBER.

Encouraged by the success of the premiums sent out in previous years, and desirous to introduce THE AMERICAN GARDEN into every home, we offer special and most liberal inducements for the current year. All articles offered are of actual merit and decided acquisition, and several of them are now introduced for the first time.

A COMPLETE LIST,

enumerating and describing all the premiums offered to yearly subscribers, will be mailed free to all applicants.

Address all orders to

CRAZY PATCHWORK Sent to the Silk Works, New Haven, Ct. for a dollar package of their beautiful silks for patchwork.

**A Present to Every Subscriber
TO
THE AMERICAN GARDEN.**

While we offer a choice of many fine things to those who take time and trouble to aid the publishers in extending the circulation of THE AMERICAN GARDEN, as a recognition of their kind efforts and as a reward or pay for such aid; and while we intend to and shall make THE AMERICAN GARDEN worth to every reader many times its small cost, yet we desire to give a friendly recognition of some direct kind to each one of our readers as far as possible; and having unusual facilities for securing valuable seeds, etc., desirable for use or for trial, we offer to every subscriber to THE AMERICAN GARDEN his or her own choice of any one of the Seed, Plant, or Bulb parcels named below.

THIS OFFER IS TO EVERY SUBSCRIBER, for one year, whether subscribing singly, or in Premium or other Clubs.

In sending your subscription or giving it to club gatherers, give in each case the letter indicating what you desire.

Our readers will notice that many of the things named are new and rare, and of extraordinary merit. To purchase these (if they could all be bought) would cost 25 to 50 cents each.

POSTAGE FREE. All the articles offered as presents below will be sent postage prepaid.

FLOWER SEEDS.

Directions for culture are given with each package.

A. Wild Garden Seeds.—A half-ounce packet. This novelty in flower gardening, which was first introduced as an AMERICAN GARDEN premium, continues to be a general favorite; and being in greater demand than ever, we retain it among our premiums. The present selection contains over 100 varieties of choice flower seeds, which, in single packets, could not be bought under \$5.00.

B. Single Dahlias.—A packet of seeds carefully selected from over 100 varieties, comprising all the most brilliant and decided colors. If sown in early spring, in pots in the house or in the hot-bed, flowering plants may be had by mid-summer.

C. German Pansies.—A packet of fifty seeds of these lovely flowers, of which one can never get tired. The seeds here offered are from the best and choicest collection in Germany.

D. Asters, Choicest Mixed.—The most desirable and valued varieties of the best German and French strains, are represented in these packets, which are vastly superior to what is generally known as Mixed Asters.

E. Everlasting Flowers.—A mixed packet of 12 distinct varieties. This class of flowers is constantly increasing in favor; and for winter bouquets and decorations generally nothing is more treasured. All are annuals of easy culture.

F. Ornamental Grasses.—A mixed packet of the twelve best varieties. As an accompaniment of flowers, fresh or dried, in bouquets or vases, nothing can be more appropriate and graceful than sprays of ornamental grasses.

VEGETABLE AND FARM SEEDS.

G. Pea, Bliss' Ever-bearing.—A sample packet of this extraordinary new wrinkled Pea, which is now, for the first time, offered to the public. For large yield, excellent quality, and continuance of bearing, it has no equal.

H. Cauliflower, Sea-foam.—One packet. This valuable new variety combines more desirable qualities than any of the older kinds; in size and beauty, and especially in reliability of heading, it excels all others.

I. Water-melon, American Belle.—One packet, now first introduced, and of great value for home use as well as for market. It is very large, early, and of delicious quality.

J. Oats, Black Champion.—A sample package. These Oats were selected from a number of varieties received from Europe, and are of great promise. Selected heads have averaged one hundred and sixty-nine grains. The roots tiller more abundantly than those of any other variety, so that half the quantity of seed usually sown per acre is sufficient.

K. Barley, Imperial.—A sample packet. All reports about this new variety speak in highest terms of its excellence. In yield and quality alike, it is a valuable acquisition.

L. Potato, Tremont.—One tuber. A medium early variety of excellent quality; now offered for the first time.

M. Potato, Iroquois.—One tuber. A large, handsome variety of good quality, large yield, and superior keeping quality; now first offered. Both varieties received *First Class Certificates of Merit* by the London Royal Horticultural Society at the recent great International Potato Exhibition.

PLANTS AND BULBS.

N. Helianthus multiflorus, fl. plen. Golden Sunflower.—A hardy perennial plant of great beauty, grows about four feet high and bears a profusion of rich golden yellow flowers of the size of Dahlias.

O. Polyantha Rose, Mad. Cecile Brunner, the Fairy Rose.—This is an entirely new class of Roses of dwarf habit, with bright flowers of exquisite fragrance; hardy and effective.

P. "Curiosity," a new early flowering Pompon Chrysanthemum, with brilliant, deep-bright crimson flowers tipped with golden yellow. This choice variety just introduced here is not for sale, but is offered only as a present to our subscribers.

Q. Clematis coccinea (Scarlet Clematis).—One of the most desirable climbers for covering verandas, trellises, arbors, screens, etc., as it grows from eight to ten feet in one season. Its coral-red flowers are produced in great profusion.

R. Eulalia Japonica zebрина.—A remarkably handsome variegated grass, perfectly hardy, growing to a height of six to seven feet, and producing tall, elegant plumes, highly ornamental for vases.

S. Lilium Wallacei, recently introduced from Japan. Flowers four to six inches in diameter, of clear buff-orange color, distinctly spotted with numerous black dots. The bulb is small but perfectly hardy.

T. Amaryllis Treateri, the Fairy Lily.—A delicate, pure-white flower, two to three inches in diameter, borne on slender stems 5 to 6 inches high. Suitable for the garden or house.

U. Strawberry, the Prince of Berries.—3 plants. For complete description and life-size illustration of this really superb Strawberry, see AMERICAN GARDEN, August number.

For other Premiums see General Premium List, mailed free on application.

"ONE CENT WELL SPENT!"

Send a Postal Card for the
AMERICAN GARDEN PREMIUM LIST.

Very Desirable, Useful, and Excellent

PREMIUMS

INCLUDING

A VALUABLE PRESENT...FREE to Every Subscriber to The American Garden.

SIXTY MOST VALUABLE ARTICLES, all of guaranteed, first-rate Quality, including many wanted in every Home, and by Every Person, Young or Old. Read the Descriptions in the Premium List.

FINE PRESENTS for HOLIDAYS, and all other days; for Wedding Gifts, and to Friends.

(See Premium List.)

DELIVERED RIGHT TO YOU, FREE, no matter how far off the Good Articles in the Premium List will be delivered, **CARRIAGE PREPAID**, to any place in the United States or Territories, however near or distant, whether given as premiums, or supplied at the prices named.

N. B.—The articles not offered "delivery free," will be carefully packed without charge, and forwarded by express or otherwise, as may be desired. The expenses of carriage will not be great. They can be taken at the office of AMERICAN GARDEN without expense.

GOOD THINGS TO BUY. Aside from any articles obtained free as premiums, almost every one will need, or desire to purchase some of the **EXCELLENT THINGS** described in the Premium List when they can get them of **GUARANTEED QUALITY**, and from a **RESPONSIBLE SOURCE**, and at the **LOWEST PRICE** they can be obtained anywhere of such excellence. A Price is therefore named with **EACH** article at which we will supply it delivered **FREE**, or otherwise, as above provided.

ENTERTAINING AND INSTRUCTIVE READING.—See in the Premium List what is said about "Dips," an amusing scene; six "Watch Items," especially the 7th; about "Washing Made Easy;" "Microscopes;" and a score of other things.

This reading will interest you, aside from what is said of the particular things referred to.

A DOLLAR an HOUR can easily be secured by many persons, **LADIES** included, (also by **BOYS** and **GIRLS**), thus: Show to friends and neighbors a specimen copy of the *American Garden*, its beauty and usefulness, and low cost. An hour's time should suffice to get 2, or 3, or 4 to take it. This will give you a dollar's worth, or **MORE**, of the valuable articles in the Premium List—articles better than their money cost. Why! it would pay many persons to continue this as a constant employment, and sell the premium articles received when not needed by themselves. **N. B.**—Any Premium club may contain subscribers from many Post-Offices.

ALSO NOTE, that in addition to your premium you can offer to every subscriber a **FREE** Premium, as noted in preceding column. (Several of these Seed and Plant parcels will be worth a full Dollar, or more, leaving the Journal free.)

THE AMERICAN GARDEN is a Large, Beautifully Illustrated Journal, printed on fine paper. It is specially devoted to GARDENING, FLORICULTURE, Fruit Culture, and to Horticultural interests generally. It is of GREAT VALUE in every Garden or Lawn, on the Farm, in the Village, or in the City. The Editors and Contributors are men who write and speak from their own large daily experience and observation. **LADIES** will find it especially useful in caring for their Flowers and Plants indoor and outdoor. (The Garden is by far the best paying plot on the farm, and adds immensely to the comfort and healthfulness of the home table. THE AMERICAN GARDEN will add many dollars to the products of even the smallest plot.)

What Others Say. Attention is invited to the Border of the first page of the Premium List giving a few of the multitude of similar voluntary expressions, coming from those who are and have been its readers for years past. The Editors and Publishers pledge themselves to make THE AMERICAN GARDEN increasingly valuable by their most earnest efforts, by additional assistance, and by Liberal Outlay for Illustrations, gathering information, etc., etc.

TERMS—One Dollar a year, Mailed Free (This includes the valuable parcel of Plants, Seeds, etc. See preceding column. 3 months' trial trip, 30 cents. Single number, 10 cents. Sample copy and Premium List FREE. Ditto, with colored plate, 10 cents.

A CHRISTMAS STORY.

Crash! Dash! Smash!
Smash! Dash! Crash!
A cry resounds through the crowded street,
Mid clattering hoofs and hurrying feet—
"Stop him! Stop him! Oho! Hey! Hey!"
A spirited horse is running away!
Galloping, scampering, frightfully fast,
The terrified animal dashes past
Through a throng of busy men and boys,—
Oh! The grim confusion! The horrible noise!
As they scream and scatter in great dismay,
And try their best to get out of the way.
The runaway's gone in a moment;—and then
There are left in his track two wounded men.
ONE, with a ghastly gash in his head,
Groans for a moment;—and lo! he's dead.
Never had he been the least afraid
Of sudden disaster! nor ever made,
For innocent babes or delicate wife,
Provision, in case he should lose his life.
There is grief in the home that once was bright;
There are darkness and gloom instead of light;
For the sorrowing mother of infants small
Is left a widow, with nothing at all.
THE OTHER, with badly broken bones,
Is roughly dashed on the paving stones.
They carry him home and put him to bed,
And the doctor gravely shakes his head
As he says, "My friend, it's a narrow escape:
"I find you in terribly battered shape.
"I hope we'll be able to pull you through,
"But you'll stay in bed for a month or two."
And though he is suffering all the while,
His face is wreathed with a pleasant smile,
And he says, "The prospect's not so bleak;
"For I'll draw my twenty-five dollars a week;
"A MUTUAL ACCIDENT POLICY'S mine—
"What a pleasant provision! isn't it fine!"
CHRISTMAS DAY! At the well spread table
The man who was smashed is happily able
To sit with his family friends again,
Fully recovered, and free from pain.
And he tells of the awful crash, that day
That the terrified animal ran away,
And dashed him down on the paving stones,
With bad contusions and broken bones.
And he speaks from the depths of a thankful
heart
Of the marvelous skill of the surgeon's art;
But better than surgeon or medicine-chest,
Better than all, and by far the best,
He says he will always thankfully speak
Of that welcome twenty-five dollars a week;
And also, if he had lost his life,
Five Thousand Dollars assured to his wife,
By the United States Mutual Accident Association,
Three hundred and twenty Broadway, N. Y.
JAMES R. PITCHER.

THE RURAL NEW-YORKER.

The great Farm and Garden Journal of America, with its valuable Free Seed Distributions, and the AMERICAN GARDEN,

With its premiums—all one year, for only \$2.50!!!
THE RURAL NEW-YORKER costs more to publish than any other of its class. It presents over 500 original engravings annually of cattle, grain, fruits, flowers, etc. It has over 600 contributors—among them the best writers in the world. It owns Experiment Grounds of 82 acres worked in the interests of its subscribers.
THE RURAL NEW-YORKER is for the North, South, East, and West. It has become the leading rural paper by real worth, perseverance, and enterprise,—by its devotion to the true interests of all who till the land whether for pleasure or profit. It is printed upon fine, tinted paper, 16 pages, weekly, each page 9 x 15 inches; that can instill, elevate, and interest the rural home.
The new varieties of seeds offered in THE RURAL'S Free Seed Distribution are alone worth more, at retail prices, than the yearly price of the Journal. Specimen Copies will furnish all details, with original engravings. Send for free specimens, which will be forwarded at once, to

Every Farmer should read

ROE'S NEW STORY
 BEGINNING IN THE **CHRISTMAS (December) Number** OF **Harper's Magazine.**
 (THE FIRST NUMBER OF A NEW VOLUME.)

Mr. E. P. ROE is widely known as a fruit-grower as well as one of the most popular of American novelists. In

NATURE'S SERIAL STORY, he follows, month by month, the incidents of farm-life and the changes of nature in a country home in the Highlands; and most delightful pictures of nature have been made for it by the celebrated American artist, W. HAMILTON GIBSON, author of "Pastoral Days" and "Highways and Byways."

The Christmas Number, containing the opening chapters of Mr. Roe's Serial, will be mailed to any part of the United States on receipt of thirty-five cents. Address

HARPER & BROTHERS, Franklin Square, N. Y.

AN ASTONISHING OFFER, 3 FOR 30 CENTS
 Number One of "Ogilvie's Popular Reading" contains the following complete stories, each one of which would cost \$1.00 in book form: The Octoroon, by Miss M. E. Bradton; Harry's Folly, by Bertha M. Clay; Ninety-nine Reel-ratons, by J. S. Ogilvie; Chunks of Fun, with 20 illustrations by Ike Philkins; Nat Foster, the Boston Detective, by Harry Rockwood. All of the above stories, printed in large type, with handsome colored lithograph cover. Sold by all news-dealers, or mailed to any address, on receipt of 30 cents, by J. S. Ogilvie & Co., Publishers, 31 Rose Street, New York.

THE MARYLAND FARMER,

Bliss's Illustrated Potato Catalogue. — Contains a list of 500 varieties of Potatoes, embracing new and very promising varieties, with explicit directions for culture, and much other valuable information respecting this indispensable esculent. 10 cents.

TWO NEW TOMATOES.

THE CARDINAL.

This new Tomato has been carefully cultivated and subjected to many tests during the past year or two, and has maintained a remarkable perfection in all that can be desired in a Tomato. It is of vigorous growth, yet comparatively compact in habit, and, weight of fruit considered, is the most productive variety known. The fruits perfect in shape, being uniformly smooth and free from ridges, and is of a brilliant cardinal-red. Although firmness of seeds is a claim made for every new Tomato, it is a fact that by actual weight and measure tests THE CARDINAL has at least one-third less seed than the very best of the other varieties, and the thickness of pulp is most remarkable. It gives promise of being a good shipping sort, as ripe fruits picked in midsummer have kept in fine condition for ten days. The decided points of merit as described puts THE CARDINAL ahead of all other Tomatoes. Were it not so, there would be no need of adding another to the already large list of varieties.
Per pkt. of 30 seeds, 25 cents; 5 pkts., \$1.00.

KING HUMBERT.

A European novelty, recommended on account of its earliness, handsome form, and delicious flavor. The raiser describes it as follows: "Of the size and shape of a large plum, scarlet, very smooth and glossy, contains but few seeds, and in flavor closely resembles that of an apple of fine quality. None of the Tomatoes known to me equal in productiveness this fine sort, which is also one of the earliest, and will probably be found well adapted for northerly districts."
Per packet, 25 cents.

SEEDS WORTH GROWING! TWO NEW PEAS.

Bearing until Frost.

Encouraged by the flattering and unprecedented success which Bliss's American Wonder Pea has met in all parts of the civilized globe, it affords us great pleasure to offer now two other new varieties by the same originator, the late Mr. CHARLES ARNOLD, of Canada, which, we are confident, will be received with no less favor.

BLISS'S ABUNDANCE.

Half dwarf, 15 to 18 inches high; foliage large, thick, full, and dark green; pods 3 to 3½ inches long, round, full and well filled, containing six to eight large wrinkled peas of excellent quality.

It ripens second early, being fit for the table about one week after the earliest kinds. The most striking feature of this variety is its remarkable tendency for branching directly from the roots, forming a veritable bush. Many plants throw out extra and more branches, each of which becomes literally covered with blossoms and pods in such ABUNDANCE that the quantity produced by each branch would be considered a bountiful yield for an entire plant of many of the older varieties. In succession to the American Wonder, for home use or market, this variety presents more desirable points than any other we are acquainted with.

Sold in packets only, 25 cts. each; 5 pkts., \$1.00

BLISS'S AMERICAN WONDER PEA.

Extra Early, Very Dwarf (8 to 10 inches), Requires no Bushing, Exquisite Flavor.

With the introduction of our now world-famed AMERICAN WONDER, the highest degree of earliness and productiveness, combined with excellence of quality, has been secured. ABUNDANCE adds another link to the unending continuance of abundant and delicious supply through midsummer, while EVERBEARING extends the chain of the richest and most valued products of the garden and field through Summer and Autumn, thus furnishing an uninterrupted and never failing supply from the earliest days of Summer till the relentless frosts and winter snows lay low our plants and bid the gardener rest.

On account of the scarcity of seed of these TWO NEW VARIETIES, we shall not offer them in larger quantities than one-fifth pint packets, 25c. each, or 5 packets for \$1.00.

American Wonder. Per packet, 20c.; pint, 40c.; quart, 75c., by mail, post-paid. If by express, at expense of purchaser; pint, 30c.; quart, 50c.; peck, \$2.50.

Bliss's American Racer.—After trial, in almost every section of the country, this Pea has proved very early, exceedingly productive, and in general good quality surpasses all other tall-growing early, yellow, smooth varieties. It continues in bearing several weeks, and grows from three to five feet high. Per pkt., 20 cents; pint, 45 cents; quart, 75 cents, by mail, post-paid.

One packet of each of the four varieties will be mailed to any address in the United States for 80 cents.

BLISS'S EVERBEARING.

The want of a reliable first-class Pea for Summer and Autumn use has long and seriously been felt by every one. With this new and remarkable variety, we are confident to place before the public a Pea which, when sufficiently known, will everywhere be recognized as the main dependence for a Summer and Autumn crop. Season late to very late; height of vines, 18 to 24 inches; foliage very large, firm, and bright green; pods 3 to 4 inches long on the average, six to eight peas in each pod, wrinkled as the preceding; quality unsurpassed in sweetness as well as flavor. We do not hesitate to say that, for continuance of bearing, this variety is unequalled, if equaled, a characteristic which gives it especial value for late Summer and Autumn use. After repeated pickings, the vines continue to be covered with blossoms and buds, developing to maturity in turn until cut down by frost, making it practically as perpetual a bearer as can be found in the Pea tribe.

Sold in packets only, 25 cts. each; 5 pkts., \$1.00.

HENDERSON'S NEW CELERY—WHITE PLUME.

See illustration on another page.

The introduction of this new and distinct variety bids fair to so simplify the culture of Celery that the most inexperienced can grow it in proper condition for the table with the same facility as they can a Cabbage or Lettuce. The stalk and portions of the inner leaves and heart are naturally white, so that by closing the stalks, either by tying them together or by pressing the soil up against the plant with the hand, and again drawing up the soil with the hoe or plow, so as to keep the soil that has been squeezed against the Celery in place, the work of blanching is completed. The great advantage of this over the slow and troublesome process of blanching required by all other sorts is evident. Its eating qualities are equal to the very best of the older sorts, being crisp, solid, and of a pleasing, nutty flavor, while its white, feather-like foliage places it ahead of all others as a table ornament. Per pkt., 50 cents.

NEW FRENCH CELERY—GOLDEN-YELLOW LARGE SOLID.

A French variety, claimed to be self-blanching to a very remarkable extent, the outer ribs even assuming, without any of the tedious processes usually resorted to when blanching, a creamy-white color of a fresh and very pleasing appearance. Per pkt., 25 cents.

SQUASH—OLIVE.

A novelty from France, now offered for the first time. The shape and color of the fruit are exactly like those of an olive; in weight it ranges from six to ten pounds; the skin is smooth and extremely thin, and the flesh thick, firm, of a golden-yellow color, and of remarkably good quality. Per pkt., 25 cents.

NEW EARLY RHUBARB—"PARAGON."

This variety, although now offered for the first time in this country, has had extensive trial in England, and has more than verified the claims made for it. It is unquestionably one of the finest varieties of Rhubarb ever offered, being the earliest of all and wonderfully prolific. The crowns and stalks are produced in such profusion that more than twice the weight can be gathered from "PARAGON" than from any other sort. It has also the qualification over all others that it NEVER SEEDS, a claim that no variety tested and found well sustained last Summer. The leaves are remarkably small, while in color the stalks are a beautiful bright red, and in flavor unsurpassed. Price, strong plants, 75 cents each; \$7.50 per dozen.

For further description of above and other Novelties, see our HAND-BOOK FOR THE FARM AND GARDEN (mailed for 6 cents to cover postage).

It is adapted to every locality. Send for Specimen copy. Address, THE TIMES, CINCINNATI, OHIO.

Sedgwick Steel Wire Fence

Is the only general purpose Wire Fence in use, being a Strong Net-Work Without Barbs. It will turn dogs, pigs, sheep, and poultry, as well as the most vicious stock, without injury to either fence or stock. It is just the fence for farms, gardens, stock ranges and railroads, and very neat for lawns, parks, school lots and cemeteries. Covered with rust-proof paint (or galvanized) it will last a life-time. It is Superior to Boards or Barbed Wire in every respect. We ask for it a fair trial, knowing it will wear itself into favor. The Sedgwick fences, made of wrought-iron pipe and steel wire, defy all competition in neatness, strength and durability. We also make the best and cheapest All Iron Automatic or Self-Opening Gate, also Particulars ask Hardware Dealers or address the Manufacturers,

Remarkable Potato Yields from the Mapes Manures.

PROTECTION FROM SCABBINESS, ROT, ETC. PERMANENT IMPROVEMENT TO THE SOIL.

Increase your supply of farm manures by adding the Mapes Potato and other Special Crop Manures.

SUPERIORITY OF POTATO CROPS GROWN WITH THE MAPES POTATO MANURE.

684 Bushels of Potatoes on less than one acre.

ALFRED ROSE, Penn Yan, Yates County, N. Y., reports on Potatoes: "Eximius," on one measured acre, 61 rows. After Potatoes were up, 4 rows entire were carried off by a flood, reducing the yield proportionately.

10 cords barnyard manure broadcast, } 684 bushels from the 57 rows (4 rows }
200 lbs. Mapes Potato } short of an acre). Quality very }
300 " " " " in the drills, } superior, bright, smooth, very large, }
200 " " " " at hoeing, } and uniform.

ALFRED ROSE, Penn Yan, N. Y., reports also on other varieties as follows:

- 100 hills of each, experimentally, same fertilizing as with the above.
- "Invincible".....at rate of 960 bushels per acre.
- "Rocky Mountain Rose"..... " 948 1/2 " "
- "Eximius"..... " 846 " "

When the Mapes Potato Manure was omitted, the yield was decreased on the several varieties 200 to 220 bushels per acre. Mr. Rose writes: "There is a great difference (in yield) in favor of the Mapes Potato Manure, also in FINER QUALITY and SMOOTHER potatoes."

355 bushels Potatoes on one acre (second application of the Mapes Potato Manure when plants 5 inches high).

240 bushels Potatoes per acre on balance of field (20 acres)—only the Mapes Manure used on the entire piece.

Dr. W. S. COMBS, Freehold, Monmouth County, N. J., Oct. 6th, 1883, writes:

"The potatoes (Mammoth Pearl) were planted from 20th to 25th of April on ordinary clay soil, and were fertilized with the 'MAPES POTATO MANURE' at the rate of one-half ton per acre. Nothing else was applied. The Potato Manure was used one-half in the row and half broadcast. As near as I can estimate, the average yield was about 240 bushels per acre. I have one acre to which, when the plants were five inches high, I applied another dressing of fertilizer and worked it in. This acre I had accurately measured and the potatoes from it weighed; the result was 355 bushels on the acre. The field is now sown with wheat—no manure or fertilizer being used."

Send postal for forthcoming pamphlet, containing reports from practical, well-known TRUCK, FRUIT, AND SPECIAL CROP GROWERS. Many of these growers use twenty tons and upward of the Mapes Manures in a season. Address

THE MAPES FORMULA AND PERUVIAN GUANO COMPANY, 158 Front Street, New-York.

"ACME" PULVERIZING HARROW,

Clod Crusher, and Leveler.

AGENTS WANTED. It is the best selling tool on earth.

The "ACME" subjects the soil to the action of a Steel Crusher and Leveler, and to the Cutting, Lifting, Turning process of double gangs of CAST-STEEL COULTERS, the peculiar shape and arrangement of which give immense cutting power. Thus the three operations of crushing lumps, leveling off the ground, and thoroughly pulverizing the soil are performed at the same time. The entire absence of Spikes or Spring Teeth avoids pulling up rubbish. It is especially adapted to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that cuts over the entire surface of the ground.

We make a variety of Sizes working from 4 to 15 Feet Wide.
DO NOT BE DECEIVED. Don't let your dealer palm off a base imitation or some inferior tool on you under the assurance that it is something better, but **SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL.** We will send the double gang Acme to any responsible farmer in the United States on trial, and if it does not suit, you may send it back, we paying return freight charges. We don't ask for pay until you have tried it on your own farm. Send for Pamphlet containing Thousands of Testimonials, from 46 different States and Territories. **HARRISBURG, PA. NASH & BROTHER,** Manufacturing and Principal Office: N. B.—PAMPHLET "TILLAGE IS MANURE" SENT FREE TO PARTIES WHO NAME THIS PAPER.

Knives, like cut, Ivory handle, 50 cents; Pearl handle, 75 cts.; 3 blades, Pearl handle, \$1.00; every Lady should have one, as they are well suited for all purposes, being well made of the very best quality of steel, and warranted.

Vol. V.

NEW-YORK, FEBRUARY, 1884.

No. 2.

ABOUT OURSELVES.

Thanks to the kind efforts of our friends, a large number of new subscribers has been added to our subscription list. To prove to these, as well as to our old friends, that we are not unmindful of their confidence, shall be our earnest aim. We have always endeavored to make THE AMERICAN GARDEN worthy of the general commendation it has received, and shall, during the present year, spare no efforts to maintain its high position among its contemporaries.

As far as the mechanical part,—paper, typos, printing, illustrations, and the general

brought to the highest degree of usefulness. However well informed an editor may be, no one fit for the position is vain enough to believe that he knows more than all his readers. The more carefully he studies their needs and consults their preferences, the more valuable can he make his paper to them.

Many of our readers have, no doubt, given particular attention to the cultivation of certain classes of flowers, fruits, or vegetables, and have learned special methods of treatment not familiar to others. In a few minutes of time the essence of such knowl-

what they owe, but from absolute necessity. To keep a debit and credit account for every subscriber and collect outstanding bills would cost more than the profits of the publication amount to. We would much prefer not to publish a paper at all than to adopt so ruinous a policy.

NO MISTAKE.

It is not by mistake that subscribers receive occasionally more than one copy of the paper. To those of our readers who we have reason to believe take an interest

THE BLUE SPRUCE IN PROF. SARGENT'S GARDEN, NEAR BOSTON.
(For description, see page 30.)

artistic execution,—are concerned, it would be difficult to suggest improvement. Among our regular contributors are many of the foremost practical horticulturists and most accomplished writers of the country; and, in our editorial work, the results of a life-long study of the sciences relating to the cultivation of the soil, as well as constant and practical experience in all branches of horticulture, are made subservient to the interests of our readers.

There is a department, however, in which, we think, there is room for improvement, and to accomplish this we need the assistance of our friends. It is the interchange of the opinions and experiences of its readers through which alone a journal can be

edge may often be condensed upon a postal card, and, if mailed to us, made serviceable to thousands. It is, of course, impossible to publish all communications received; but every suggestion, every item of information, helps and adds to the general improvement and practical value of the paper.

OPEN ACCOUNTS.

THE AMERICAN GARDEN does not keep open accounts with its subscribers. When a subscription expires the paper is invariably discontinued, and it is impossible to make even a single exception to this rule. This is not from any lack of confidence in our subscribers, or fear that they would not pay

in THE AMERICAN GARDEN, we send sometimes an extra copy in the hope that they may hand it to some of their horticultural friends, that they may speak a kind word for us, and induce them to subscribe also.

A BEAUTIFUL COLORED PLATE.

With our March number we shall present to every subscriber for 1884 a beautiful colored plate of Pansies. This will be the most life-like and artistic plate of its kind ever published, and is considered by competent artists a masterpiece of color-printing. For framing it is easily worth a year's subscription to THE AMERICAN GARDEN.

The Vegetable Garden.

SEASONABLE HINTS.

To make these brief notes and timely suggestions applicable to the needs of the largest number of our readers forms generally one of the most perplexing parts of editorial work. The enormous extent of our country, reaching from the borders of the arctic region to within but a few degrees of the tropic zone, makes it impossible to give directions suited alike to all climates. While as we write these lines a fierce snow-storm pelts against our windows and all vegetation is at rest under the snowy down, some of our readers may be picking Strawberries and green Peas. It will therefore be readily perceived that, as those items of information are mainly taken from our own personal observation and experience, we have to confine ourselves, in some measure, to the latitude of New-York City. Yet, with slight modifications, according to the variations of climate, beginners in gardening anywhere may find in these columns many helpful hints.

Mistaken Economy.—The most short-sighted and poorest economy a gardener or farmer can pursue is to sow poor or doubtful seeds. While there is yet plenty of time to make tests, and to procure good seeds in case those on hand prove worthless, no one should neglect to make sure of having only first-class stock when spring-time and garden-work begin. The losses and disappointments which frequently result from sowing poor seeds are far greater than can be computed in dollars and cents. It would be about as judicious for an engineer to run a passenger train over an unsound railroad bridge, as for a gardener to trust to the chances of raising a profitable crop from doubtful seed.

Testing Seeds.—No reputable seed house will knowingly send out seeds of doubtful germinating quality, and the testing of the stock of seed before sending any out is now customary in all first-class seed houses. The risk of getting poor seed in this way is extremely small. Old seeds kept over from previous seasons, however, should always be tested before sowing. Where window plants are kept, the easiest way is to sow a few of the seeds around the plants in the pots, where they will soon sprout and the percentage of germination may be easily ascertained. Melons, Cucumbers, Corn, Peppers, Egg-plants, and all kinds requiring a high temperature, should be sown in pots or boxes set in a warm place, or they may be scattered between flannel kept constantly moist and warm.

The Duration of Vitality varies considerably in different kinds of seeds. While some have to be sown immediately after maturity, others retain their vitality for an almost indefinite period. But it should be borne in mind that although old seeds may germinate, in the majority of cases they will not produce as strong and healthy plants as fresh seeds.

Beans, Carrots, Celery, Corn, Onions, Spinach, may be relied upon for two to three years; Beets, Lettuce, Turnips, Tomatoes, for three to four years; Peas, Radish, Cabbage, for four to six years; Cucumbers, Melons, Squashes, and similar seeds, will germinate after ten years and more.

WINTER CULTURE OF VEGETABLES.

My experience in forcing vegetables, in a small greenhouse of four hundred square feet of glass, shows that there is not much difficulty nor great expense in securing a continuous supply for profit as well as for home use, and so far the success has been quite flattering.

The benches which hold the soil are five feet wide and six inches deep, and the path is in the center. The soil has been used for hot-beds and is rich in vegetable mold. It has not been renewed in the three seasons it has been used, as there seemed no need of it. I have a few flowering plants in the house all the time, the temperature is, therefore, often too warm and close for Lettuce, so that the plants set out the first of October do not as well as they would under more favorable conditions, but it occupies the bench till January, when it is cut and sold for what it will bring. This is the first crop, on one side.

The other side is set out September first, to Parsley roots, in rows, five inches apart, and one inch or two between the plants. The soil is well soaked with water at the time of setting the roots, which grow vigorously and give a cutting about Thanksgiving, and continue to grow till the first of April, when they begin to run to seed, yielding about four cuttings during the winter. The roots are removed from the benches in time to give room to flowering plants which have been potted from cuttings and are ready for sale in May and June. The Parsley yields about \$3 per sash, on a space 3x5 feet.

After the Lettuce is off in January, I set out half-grown Celery plants, Water Cress, and Dandelion roots, on the bench in its place. The Celery gives green leaves for "soup bunches" from February to April, and yields as much profit as the Parsley per glass. The Water Cress, propagated from a few cuttings brought in in the Fall, gives an equal return; two-thirds of the bench has Dandelion roots set thickly in rows five inches apart; these are ready to cut in four weeks from the time of setting, and sell for \$1.25 per glass. The Celery, Dandelion, and Parsley roots are raised the summer before, and preserved in what I call my "winter house," till the time needed. As soon as the Dandelions are pulled, the bench is sowed to French Breakfast Radishes, which come on and are harvested after six weeks, yielding the same as the Dandelion, \$1.25 per glass.

After this the space is occupied by Celery, Celeriac, Leeks, Parsley, different kinds of Cabbages, Kohlrabi, and Cauliflower, all sown in flats, besides Lettuce, Tomatoes, Peppers, and so on. During mild days of April, the Lettuce, Cabbage, and all plants that need hardening are crowded outside and brought back at night, and as the weather grows milder, left out altogether. Tomatoes, Peppers, and Celery, as they become crowded, are pricked out into the spaces made vacant by the hardier plants, so that, on the first of May, the house is as full as at any time.

As fertilizer, I have used fine horse manure, and have had good crops. This was well dug into the soil twice during the winter, and by keeping it well aired, watered, and heated, have had no trouble with anything but Lettuce.

I have also raised Endive on the benches instead of Lettuce; but the house being too hot, the leaves did not bleach readily, and

the experiment cannot be called a success. Onion "sets," set out, do fairly well; Chives nicely. Spring Lettuce, I raise in hot-beds outside, and have always good success, as more air and more room can be given. Lettuce wants a cool head and warm feet.

All this is on a small scale; but it pays well in proportion to the money invested, as myself or some member of the family does all the work.

W. H. BULL.

EARLY POTATOES.

When it is desired to produce a crop as early as possible, I find nothing more serviceable than an application of fresh stable manure in the hill.

The soil should be worked into good condition by plowing and harrowing. I lay it off in rows three and a half feet apart, by furrowing with a good-sized double shovel plow, so as to make a rather deep furrow. Into the bottom of this furrow apply fresh stable manure, a reasonably strong dressing; on this drop the Potatoes, two sets in a hill, and the hills eighteen inches apart. I find it good policy to cut the sets at least two or three days before planting.

After the Potatoes are dropped, cover with a hoe at least three inches deep, stepping upon the soil, so as to press it firmly down upon the Potatoes.

The fresh manure seems to help considerably about keeping out the frost, and the Potatoes grow right along. In this way Potatoes can be planted a week or two earlier than by the usual plan.

I am always careful to use only good seed, and especially when I want good early Potatoes. Although, with everything favorable, you may sometimes raise a good crop from poor seed, yet this is only the case when the general crop has been plentiful and the prices are low; while, by using only the best of seed, giving it good soil to grow in and good, clean cultivation, you are reasonably sure of a good crop when others fail; and as you then receive a higher price, the result is more profitable.

Potato-land should be plowed deep and well. A black, sandy loam is preferable to any other soil, as it is loose and retains moisture well, is easily cultivated, and produces clean, smooth Potatoes.

N. J. SHEPHERD.

ONIONS WITHOUT LABOR.

Impressed with the desirability of having an early bed of Onions, enough for summer use and a few bushels to winter over, and in view of the fact that it is no easy task to weed and care for a bed of Onions, as they are usually raised, the Germantown *Telegraph* advises the following method by which weeding is entirely dispensed with:

Prepare a bed, say sixteen foot square, of proper fertility, cultivate deep, rake it smooth and fine; now lay on a board, about one foot wide, at one side of your bed, stand on the board, and place your sets close to the edge, say four inches apart, the entire length of the board; now lay down another board, one and one-half inches from the other, place your sets as before, and proceed thus on till the bed is completed. Leave on the boards until the Onions have matured. Thus you will have a nice bed of Onions without labor, save the preparing of the bed and the placing of the sets.

RHUBARB CULTURE.

Rhubarb, like Currant bushes, will grow almost anywhere and under any treatment, and consequently receives more ill usage than any other "green thing growing." But for this reason it should not be supposed that when growing under neglect and abuse it will do its best and produce as abundant crops and of equally good quality as when good treatment is given.

After it is once planted, Rhubarb requires little cultivation, but it must have at all times deep, rich soil, the richer the better. In field culture, the roots are planted about four feet apart each way, and cultivated

fall, the roots will produce a crop for an almost indefinite period. Heavy manuring, clean cultivation, and liberal space are the essential requisites for raising large, succulent Rhubarb. The varieties best known are:

Linnaeus, grown extensively for market as well as home use. It is early, very productive, and of a brisk, spicy flavor. Its principal fault is that it seeds so freely that unless all flower stalks are cut off as soon as they appear, the crop deteriorates rapidly.

Victoria is later, has larger leaves and stalks, and requires very rich, rather heavy ground for its best development.

strength of the plant being used for the development of its leaves. The habit of the plant is remarkably compact, so that plantations do not require to be renewed every few years, while the elumps nevertheless retain their original position. To judge from the high praise this variety has received in England, as well as from our own experience in growing it, we do not doubt that, when generally known, it will be largely planted in preference to the older kinds.

THE BEST TOMATOES.

In a test of fifty-five Tomatoes grown by Josiah Hoopes, and reported by him to the

EARLY "PARAGON" RHUBARB.

like any hoed crop. In the family garden, they should be planted two to three feet apart, in a single row, at least four feet distant from other plants.

It may be raised from seed, but as there is little reliance in the seedlings being of the same variety as the parent plants, division of the roots is the method of propagation usually adopted. Any piece of root with a bud or crown will grow if planted about two inches deep in mellow soil firmly pressed around it. Roots may be planted in autumn or early spring. Plantations are usually renewed every four or five years, yet when a liberal dressing of manure is given every

Paragon. This is a new variety, originated in England, and now introduced here. We grew it last year alongside of the older kinds, and were so favorably impressed with its superiority that we give herewith an accurate, much reduced illustration of a clump of roots and leaves. The stalks are bright red, very heavy, and produced in quick succession and wonderful abundance. It is earlier, of more delicate flavor, and decidedly less acid than any other variety we are acquainted with. But its most remarkable and most valuable qualification is that it does not produce flower stalks, to which fact its great productiveness is mainly attributable, all the

New-York Tribune, he favored Livingston's Perfection and Favorite as especially deserving of praise. The fruit was large and solid, not cracking, and very even croppers. The Trophy held its own nobly. Among the early varieties, the Mayflower was a decided improvement on the Aeme. Beauty was large, solid, and of brilliant scarlet color.

Among the yellow varieties, the Golden Trophy proved the best in the entire list. In fact, it was not excelled in the whole collection for evenness of outline, solidity, fine flavor, and productiveness. When fully ripe, it has a rich golden tint, and when sliced raw, it makes a very ornamental dish.

The Fruit Garden.

SEASONABLE HINTS.

Spring Protection.—There is a great deal said about winter protection of Strawberry and other plants, while the importance of spring protection is but rarely considered. During the severest part of winter, when snow covers the land and the soil remains frozen solid for some months in succession, there is little danger for the plants. The critical period comes toward the end of February and in March, when the increasing warmth of the sun's rays thaws the ground in day-time to freeze again during the night following.

Strawberry Beds should therefore be examined carefully as soon as free from snow. Wherever the mulching material has been carried away by winds, it should be replaced at once. Plants not covered previously will be materially benefited by mulching at this season, especially on heavy and wet soils. A few hours' time spent for this purpose may make all the difference between a plentiful crop and no berries at all.

Scraping of Fruit Trees is often carried to excess. A healthy, vigorous tree does not require to be scraped at all; it needs all its natural bark for protection against the cold, drying winds of winter, and against the parching sun of summer, as much so as birds need their feathers and wild beasts their fur. The superfluous scaly part of the bark of a healthy tree is continually thrown off by its own expansion. Yet when trees become feeble and sickly, and their trunks and branches overgrown with moss and lichens, a general scraping and washing may become serviceable, not only for the destruction of these parasites, but also to expose and destroy the hiding places of the legions of injurious insects which make their winter homes and deposit their eggs under this dead and decaying matter.

How to Scrape a Tree.—As trees are generally scraped, more harm than good results from the operation. Great care should always be taken not to disturb or injure the lower and living part of the bark. There is an instrument, a "tree-scraper," made for this purpose, but a common mason's trowel or a short-handled hoe answers the purpose fully as well.

Washes for Fruit Trees.—Ordinary white-wash, as frequently used, has very little effect except to disfigure the trees. To destroy the insects and eggs hidden in the crevices of the trees very much stronger applications have to be used. Soft-soap reduced to the consistency of a thick paint, with the addition of a strong solution of washing soda, makes one of the most effective and most lasting washes. A solution of one pound of commercial potash, in from two to four gallons of water, is also very good.

Petroleum Emulsions as insecticides, especially for the destruction of scale insects, have recently, through the investigations of Prof. C. V. Riley, been brought to prominence. After a long series of experiments with a great many substances, milk was found not only the most available but also one of the very best substances for the production of petroleum emulsions.

A GRAPE ELECTION.

To select a limited number of the best varieties of Grapes or any other fruits, is not so easy a matter as may be supposed at a first glance. Each variety has some peculiarities which may make it more suitable for certain localities than others, which fact explains the diversity of opinions, even among those most competent to judge.

The discussion on this subject, at the recent session of the New Jersey State Horticultural Society at Camden, was of unusual interest. Of special value may be considered the result of a Grape election taken in answer to the following question:

"Which are the six best and most desirable varieties of Grapes for home use and general culture—two black, two red, two white—quality, hardness, and general healthiness considered?"

The result of the vote was as follows:

Black—*Concord, Worden.*

Red—*Brighton, Jefferson.*

White—*Pocklington, Duchess.*

Although there were about two hundred persons present at the meeting, only twenty-three voted; but as among those were nearly all the most prominent and most experienced fruit-growers of the State, this list may well be considered the most judicious and reliable selection that could be obtained from any source.

The highest number of votes, regardless of the color of the fruit, was given to the Brighton, which received 20 of the twenty-three votes cast; Concord received 16; Worden, 14; Pocklington, 13; Duchess, 12; Moore's Early, 11; Jefferson, 7; Delaware, 6; Lady Washington, 5; Lady, 4; Martha, 3; Prentiss and Wilder, each, 2; Champion and Herbolt, each, 1.

GRAPE PRUNING.

Grape-vines that have not already been pruned should now receive attention, and how to do it is a question on which there are a great variety of opinions. Occasionally we find a person who opposes pruning altogether, as being contrary to nature, and who is satisfied with results obtained from this let-alone system; but the great majority of professional and amateur grape growers believe in pruning, and pruning close too, and find a profit and satisfaction in doing so.

The novice who is not versed in this matter should remember that this year's fruit is borne on canes of this year's growth, but the buds producing them are to be found on the young wood of last year. It is very seldom that a bud starting from old wood will produce fruit the same season; such growth, therefore, is only of use for renewing old wood and laying the foundation for a crop of fruit the next season. It should also be borne in mind that the tenderness of the sap is to the extremity, and that the strongest and most vigorous canes are generally to be found there.

For instance, if you will examine a cane that was cut to three or four feet last winter, you will find the old buds have grown the strongest, and generally the buds nearer the old wood started feebly and, failing to ripen, are now dead because the sap rushed past them to the buds beyond; and thus it is that the longer you prune the farther you have to go for your fruit every year. By short

pruning you confine your fruit nearer to the trunk of the vines. After your vines have once reached the limits desired, it is easy to keep them there.

Some judgment is also needed to prevent too thick a mass of shoots at any one point, which is apt to occur on old vines where a cluster of young shoots have been allowed to grow. With such vines, spur pruning to two buds is generally practiced, and not more than two spurs should be allowed at one point. These will make four shoots and set two or three bunches each, and a little study and thought will enable the operator to judge how the vine will look after growth. Care should also be taken not to overload the vines by imposing too great a burden on them. Probably there is no more prolific source of failure and dissatisfaction in Grape growing than this overcropping, or one more generally prevalent, even among professional Grape growers. An overtaxed vine fails to ripen its fruit, and becomes an easy prey to the attacks of mildew and rot. It is not an easy task to judge with accuracy just the amount of fruit a vine will produce and ripen without injury. It is far better to give a vine too little than too much to do, which rule will apply to other things as well.

Where shade is of paramount importance to fruit, longer pruning may be justified, but it is possible to secure both results by short pruning, and where extra fine clusters are desired, summer pruning and even thinning of the clusters is necessary. Summer pruning should also include the rubbing off of any superfluous buds that may start out on the body of the vines. Bear in mind also that the largest and strongest shoots are not the best for fruit. A glance at the buds on a slower-grown but well ripened cane will show round, full, well developed buds, that are better for fruiting than the smaller and pointed ones to be found on extra large canes.

E. WILLIAMS.

CRYSTALLIZED FRUIT.

New industries are constantly springing up in California as if by magic. Among the latest is that of Crystallized Fruits. These fruits, for which there is a large sale in our principal cities, were heretofore all imported from France, and the honor of establishing the first factory for their production belongs to Messrs Bernard & Bonediet of Los Angeles. The process practiced by the firm is, according to a correspondent of the *Los Angeles Herald*, as follows:

"The fruit, whether White Figs, Black Figs, Oranges, Pears, Peaches, or other fruits,—those being the principal ones used,—is first relieved of its skin and sliced, after which it is placed in trays to dry a little. Next, they are dipped in water in which sugar is dissolved, then placed on trays of wire gauze, and put in the place where they are dried and become crystallized. It takes two or three days to complete the process, as the fruits are subjected to a slow heat in order to make them as nearly perfect as possible. The drying apparatus is heated by coal-oil stoves in zinc partitions underneath, by which the heat is thoroughly regulated. At present 1000 pounds of marmalade and crystallized fruit are shipped daily to various points, but the establishment is capable of producing 5000 pounds daily."

TUBEROUS-ROOTED GRAPE-VINES.

There seems to be little doubt that the tuberous vines recently discovered in the French colony of Cochin China are, if not identical, very nearly allied to those found a few years ago in Soudan in Africa. Both have thick, tuberous roots, from which the stems are thrown up annually, dying down in winter, or the dry season.

Last summer we received, *via* California, a few seeds of the Cochin China kind. These were sown in pots in a frame, and required a long time and very high temperature to make them germinate. Finally, we succeeded in raising half a dozen plants, but they did not grow over three to four inches in height, producing three to four glossy leaves of about the shape and appearance of the Clinton Grape, when suddenly they damped off without any apparent cause. The bulbs produced are so minute that we have but little hope to be able to preserve them in a condition to start again in spring. Yet we shall give them all possible care, as few new plants have excited our curiosity as much as these singular vines. If any of our readers have had experience with them, we should be very glad to learn the results.

It is doubtful whether they can be cultivated anywhere in the United States, except perhaps in Florida; but for warmer climates they may yet become of great importance. In its native country the vigor of the plant seems almost incredible. Mr. M. Martin, the discoverer, says:

"I found these vines for the first time in the forests of Mais. Some of them attained a height of fifty feet, and were completely covered with Grapes from top to bottom. A single vine will yield two hundred pounds of Grapes—not in a general way, of course; but I have found plants which gave that amount; and some of the bunches weighed eight pounds."

Our illustration,—for which we are indebted to the *London Garden*,—reduced to about one-third of the natural size, shows well the general habit of the bunches.

The berries are of the size of our medium Grapes, and are found both red and white. The white are said to be "soft and of agreeable flavor," the red "rough." But their principal value will be for wine-making. So far, wine has only been made from them in a crude manner, and this is described as "of fine color, but green, and of but one degree lighter than that made from cultivated Grapes."

FRUIT TREES BY THE LINE FENCE.

Although the laws on this subject vary somewhat in different States, the following, according to a prominent lawyer of this city, covers the main points:

If the stem or trunk of the tree grows so close to the line that part of its actual body extends into the land of each, neither owner can cut it down without the consent of the other, and the fruit is to be equitably divided. If the stem of the tree stands wholly within

the boundary line of one owner, he owns the whole of the tree with its products, although the roots and branches extend into the property of another. The law gives the landowner on whose soil the tree stands the right to cut it down, and to pluck all the fruit from it while it stands.

In New-York State the courts have decided that trespass or assault would lie by the owner of the land over which its branches extend, if he prevented the owner of the tree, by personal violence, from reaching over and picking the fruit growing upon these branches while standing on the fence dividing the lands. The owner of the land over which the branches extend may lop the branches close to his line. He may also dig down and cut the roots square with his line.

FRUIT OF THE TUBEROUS-ROOTED GRAPE-VINE.

(One-third natural size.)

ORCHARD NOTES.

Ten years ago I thought spring the only proper season for pruning, but now I am just as firmly convinced that fall or winter is as good. Each year I do less and less pruning, because I prune the young tree mercilessly when I transplant it from the nursery to the orchard, and as a result find very little after-pruning necessary. I think this is an important point in orcharding, more so than is generally supposed. Shaping the top when transplanting, avoids the cutting of limbs when they have become large, and the consequent formation of large scars; and at the time of transplanting, and for some time afterward, the roots are not capable of nourishing a top as large as when growing in the nursery. The tops of trees planted in the spring should receive their final shaping in the fall. After that, all that I do is to cut out "water shoots,"

dead limbs, and limbs that interfere with one another.

I use for covering scars a wax made of tallow, resin, and beeswax. But I have found paint as good as any wax. I use linseed oil and mineral paint, which is cheap. Make the paint very thick, and give the scars two heavy coats.

Another error which I firmly believed in was that the ground of a young orchard should be cultivated, and while my Apple and Peach orchards were young, I kept the ground in hoed crops. But when the trees grew larger, and cast so much shade that good crops could not be grown on a considerable part of the land, I sowed both orchards in grass and clover, and in grass and clover they have remained unto this day. A few trees die out each year, and I immediately grub them up, and supply their places with trees from the nursery. It thus happens that I have trees of all ages less than thirty years growing in the orchards, and I am certain they are fully as thrifty and healthy now among the grass as the young trees were when the ground was cultivated.

I still think, however, that it is better to cultivate the land of an orchard than to neglect it altogether. But I make a hog pasture of my orchards, because I have found doing so beneficial to both orchards and hogs. The enemies of the trees seem no more numerous now than when the ground was stirred. I do not allow the grass to grow within a couple of feet of the trunks of the trees.

In quite a number of places, especially on the prairies, the rabbits occasion the orchardist considerable trouble, expense, and vexatious delay, by girdling the young trees. They confine their depredations on the young orchard to the winter months, when green vegetable food is scarce, and they are always the worst when snow is on the ground, as then they find it quite troublesome to get clover. For years I tried every preventive I heard of, but found none valuable, and had about come to the conclusion that the only really efficacious preventive was a vigorous and incessant use of the shot-gun, when some one told me to smear the trunks of the young trees with hog's liver, as far up as the rabbits could reach. I have faithfully tested this for several years now, and can say that a rabbit will not touch a tree that has been coated with it. I have not tried other liver, but suppose the liver of cattle or sheep would answer equally as well.

I am not certain but anything greasy or smelling of blood would answer. I wash the liver off the next spring with soap-suds saved from washing, using an old broom, and scrubbing the trunks and larger limbs thoroughly. But then I would do this whether there was liver on the trees or not. The keeping the trunks of fruit trees clean promotes their health, and is a good preventive against the depredations of many injurious insects.

JOHN M. STAHL.

The Flower Garden.

WHO SETS THE FASHIONS?

Who sets the fashions, I'd like to know,
For the little people beneath the snow?
And are they working a weary while,
To dress themselves in the latest style?

There's Mrs. Primrose, who used to be
The very picture of modesty.
Plain were her dresses, but now she goes
With cramps and fringes and furbelows.

And even Miss Buttercup puts on airs,
Because the color in vogue she wears;
And as for Dandelion, dear me!
A vainer creature you ne'er will see.

When Mrs. Poppy—that dreadful flirt—
Was younger, she wore but one plain skirt;
But now I notice, with great surprise,
She's several patterns of largest size.

The Fuchsia sisters—those lovely belles!—
Improve their styles as the mode compels;
And though everybody is loud in their praise,
They ne'er depart from their modest ways.

And the Pansy family must have found
Queen Elizabeth's wardrobe under-ground.
For in velvets and satins of orory shade
Throughout the season they're all arrayed.

Pinks and Daisies and all the flowers
Change their fashion, as we change ours;
And those who knew in olden days
Are mystified by their modern ways.

Who sets the fashions, I'd like to know,
For the little people beneath the snow?
And are they busy a weary while
Dressing themselves in the latest style?

New-York Independent.

SEASONABLE HINTS.

It is hardly to be supposed that any of our regular readers do not have at least a few flowers about their homes in summer; but among those who see THE AMERICAN GARDEN for the first time today, there may be some who share the common error that the raising of flowers is necessarily expensive and laborious. To maintain extensive green-houses and elaborate lawns cost, of course, considerable money, but the degree of enjoyment derived from plants and flowers is fortunately not always proportionate to the amount of money spent for them. We know many a modest flower-garden tended by loving hands, after a hard day's work, or at odd moments snatched from household duties, which gives more genuine pleasure and real enjoyment to its possessor than all the hot-houses, graperies and velvety lawns, cared for by paid labor, can offer to the millionaire.

Gardening Operations should be commenced now, by making careful plans of whatever is contemplated, by procuring the necessary seeds and implements, and by thoroughly informing oneself as far as possible about the requirements of the plants to be grown.

Soil for Flower Beds.—A light, friable loam, containing a moderate amount of vegetable matter and sufficient sand to render it porous is best adapted for most flowering plants; but as it rarely happens that the amateur gardener has much choice of soil, he must make the best of given circumstances. Fortunately, most plants accommodate themselves to various and sometimes most dissimilar conditions.

COLUMBINES.

With the introduction of the newer Western species of *Aquilegia*, which is the botanical name of the genus, these beautiful perennial plants have received renewed attention. All the species found in cultivation are worthy a place in the herbaceous border. In addition to these, hybridizers have created so many hybrids and crosses as to almost obliterate some specific distinctions.

The various shades of violet, red, and yellow are the predominant colors of their flowers, and a white Columbine of good shape and size has long been sought for. Such an one has recently been discovered in the Rocky Mountains, and is now brought to notice under the name *Aquilegia cœrulea Jamesii*. The flowers are pure white, very large and of remarkably graceful habit.

It is easily grown from seed, and if sown early in pots in the house or in a hot-bed, flowering plants may be obtained the first year. Sown in spring in the open ground it will bloom the following season. If the plants come up too thick, they have, of course,

AQUILEGIA CÆRULEA JAMESII.

to be thinned out, and the young plants may be transplanted. A moderately rich, rather dry soil suits them best. They are perfectly hardy, yet they are materially benefited by a light covering of leaves during winter.

DICENTRA SPECTABILIS.

The Dicentra, or, as it is more popularly known, the Bleeding Heart, from a rather fanciful resemblance of the flower to a heart, though just where the drop of blood is supposed to be I have never been able to determine, is a very handsome and showy plant. I do not know that florists will justify me in calling it a tuberous rooted plant; perhaps it is not, strictly speaking, but it has very thick, succulent roots, which resemble tubers quite as much, if not more than they do ordinary roots.

In a soil made deep and rich, this plant grows from two and a half to three foot high. The stalks, which are many, are of a naturally curving habit; and as they branch freely and are thrown out from the crown

in all directions, a good specimen forms a rounded mass of foliage, covering a space of four or five feet across. The foliage is much finer than that of most garden plants, and would make this plant well worth growing if it had no blossoms. Its flowers, which are a bright rose color and white, are borne in a bright raceme usually contains racemes. Each raceme usually contains from twenty to forty flowers. The flowers hang gracefully along the stem, and seem to be dancing in the air with every movement of the plant, for the stem connecting each of the flower with the stalk is so slender that at a little distance you do not see it. It blooms very profusely in May and June, and occasionally thereafter, but its later crops are never so profuse as that of the months named. It is a very easy plant to manage. Every spring, before it starts into growth, give it a dressing of well-rotted manure.

On account of its ease of management, and the certainty with which it can be forced successfully, it is a favorite with florists for winter flowers, and any one having a large clump should take up some roots and pot them for use in the sitting-room. Take them up in October, and allow the pot you put them in to remain outdoors until about the time you want to start them into growth. Or, instead of leaving them out of doors, remove them to the cellar after potting them, and leave them there until the last of December. Then bring to the light; water sparingly at first. As growth advances, give water more freely. After the shoots are a foot high, give a weekly watering with liquid manure or some good fertilizer. After blooming, return the plants to the cellar, and leave them there until spring, when they can be planted out in the border.

E. E. REXFORD.

ROSES IN THE GARDEN.

Cannon Hole, in his charming book about Roses, writes: "He who would have beautiful Roses in his garden, must have beautiful Roses in his heart. He must love them well and always." This, said the late Mr. H. B. Ellwanger, is the sum and substance of what constitutes our success in Rose culture; without this true love, failure, partial or complete, must surely attend our efforts. Because we are imbued with a love for the Rose, it does not of necessity follow that we can grow Roses well—experience teaches otherwise; the novice must be prepared to expect some disasters arising from the mistakes which he will certainly make.

FLOWERS AT FUNERALS.

Flowers, like tears, are made to serve the expression of our greatest joys as well as our deepest sorrows. The use of flowers at funerals is certainly a beautiful custom; but when we read of three huge wagon-loads of floral work being carried in the funeral procession of an illustrious French statesman, one may well be in doubt which of the two was intended to be the most prominent feature,—the funeral or the flower-show; and the most ardent lover of flowers would rather trust the green grass and wild Daisies to bodeek his grave than that his funeral should be made the occasion of a pageant flower-show.

DIANTHUS.

In the Dianthus family we have no showier members than those which hail from China and Japan. They are truly gorgeous in color, and these colors are combined in such a variety of ways that the result is very pleasing to any one who is fond of brilliant effects. These Pinks bloom very profusely, and are particularly useful for cutting, combining well with most other garden flowers, though really more satisfactory, I think, when used by themselves.

It is a fact that we do not often see spoken of that most flowers appear to better advantage in vases or bouquets when kept by themselves. It is true that there are some kinds which combine well with others, but not many. Use a dozen different kinds of flowers in the same vase, and the effect is never as fine as if but one kind were used. If you have never noticed this, try it, and I am confident that you will not use more than two or three kinds at the most in the same vase.

These Pinks can be brought into bloom quite early by starting the seeds in the house if you have not a hot-bed convenient. Keep the plants strong and healthy until it is safe to put them in open ground, by giving them all the sunshine you can, plenty of fresh air on pleasant days, and only enough water to keep the earth they are growing in moist. When they begin to grow in the garden, pinch out the top, to induce branching.

Most of them will come double, but the single ones are well worth growing, on account of their fine colors and brilliant markings. Many of them will have fringed petals, and be quite as double and large, if not as fragrant, as the *Carnation*, which is an aristocratic relative. These Pinks will continue in bloom all through the season and should be in every garden.

D. ANTHUS.

HALF-HARDY AND TENDER ANNUALS.

Under this term are understood all those annual flowering plants which, although they bloom freely in the open ground, require artificial heat to assist germination and promote their early growth. Among this class are found some of the most beautiful and most interesting treasures of the garden; and as

they flower generally after the flowering season of most hardy annuals is past, they become indispensable wherever a continuous bloom is desired.

The ordinary hot-bed of stable manure offers the simplest means of obtaining a gentle bottom heat sufficient for most seeds, though when other more perfect resources are available, they will of course be employed. In many cases the seeds are sown on the layer of soil which covers the hot-bed, but the most usual and by far the best plan is to sow them in pots or seed-pans,—the latter being preferable, as they are more shallow than pots, and afford a larger surface in pro-

portion. If it should settle below that point, a little more may be added. When a sufficient number of pots are filled, the surface of each should be gently leveled by pressure with a circular piece of wood having a clean, smooth surface, which, from rendering the smaller seeds more evident to the eye, will facilitate their equal distribution. The seeds should be uniformly and thinly scattered over the flattened surface, and be then covered by a slight layer of pulverized soil, which for most seeds need not be thicker than a twenty-five cent piece, after which the surface may again be slightly pressed, then gently watered with a very fine rose watering-pot, and it is ready to be placed in a frame.

In the case of very small seeds, the covering of the soil should be very thin, barely covering the seeds, and as seeds so minute are liable to be carried down into the soil, unless very carefully watered, it is even advisable to moisten the flattened surface of soil in the pot before sowing the seeds, instead of afterward. Place the pots containing the seeds on the hot-bed, or in the greenhouse near the glass. Keep them shaded, which will prevent absorption by the rays of the sun, and the consequent necessity of frequent watering, which cakes the soil, and does much mischief to seeds of slow growth. Flat seeds are best put in edgewise, being sometimes liable to rot when sown flat. As the seedlings of the slender-growing kinds appear above ground, care must be taken that they are not washed down and lost when water is applied.

Toward the middle

of or end of May, many of the seedlings will be ready for transferring to the borders or beds they are intended to decorate; but previous to this exposure, it will be necessary to prepare them for the removal by admitting air to the frame, both day and night; or, what is better, by placing them in a separate frame, in which they may be gradually hardened off—at first by keeping the lights down during the day only in favorable weather for five or six days, after that at night also, proceeding carefully while the nights are cold. Many of the half-hardy and tender annuals will succeed well if planted in the open ground the last of May, and treated the same way as hardy annuals.

FLOS.

GROUP OF DIANTHUS.

portion to their breadth. If these cannot be procured, shallow boxes will answer. The pots should be quite dry and clean when used, and to insure thorough drainage, which, essential for all plants, is doubly so for seedlings, must be filled at least one-third their depth with broken crocks or lumps of charcoal, the largest fragments being placed at the bottom and the smallest at the top. A uniform compost of light sandy loam, enriched by a considerable mixture of fine leaf mold, or very old hot-bed manure, kept till it can easily be rubbed to powder, may be used.

Fill the pots lightly with soil to the brim, when the pot should be gently struck to settle the mass about half an inch from the

The Window Garden AND GREENHOUSE.

THE ZANZIBAR BALSAM.

Impatiens Sultani.

The most attractive novelty introduced for many years is this new perennial plant, which, although belonging to the Balsam genus, is very different from the common Lady's-slipper, resembling in its general habit more the Touch-me-not Balsam. The plant is of compact growth, and, under favorable conditions, astonishingly vigorous.

The flowers are about an inch in diameter, of rich carmine-magenta color, and produced in so great a profusion as to nearly cover the entire plant. A more easily grown and free-flowering plant can hardly be imagined. It may be readily propagated by cuttings or from seed.

Any ordinary good potting soil suits the plant; but, when growing vigorously, some liquid manure should be applied occasionally. When grown as a house plant, it requires a treatment similar to Colens. For outdoor culture, a partly shaded location and a deep, rich, rather moist soil will be most favorable.

INEXPENSIVE WINTER ROSES.

In April of 1882 I received some three dozen Tea and Bourbon Roses, all fine plants. A cold frame was improvised for their shelter during the early spring months, and in September a 7x18 lean-to greenhouse—half house and half cellar—was constructed south of the basement laundry. The laundry is connected by a door with the furnace-cellar of the house, and its ordinary winter temperature is 50° Fahr. The windows between the laundry and greenhouse were removed. The latter is, in fact, nothing more than a large sunken cold frame, getting its heat, when the sun does not shine, from the furnace-cellar through the open door and windows of the laundry. It is provided with thick shutters hinged at the bottom. Water was introduced by extending one of the laundry pipes. Two-thirds of the plants were put on benches; the rest in pots. Their summer treatment had been unskillful; and still most of them entered their winter quarters in a healthful and even vigorous condition.

We were never without Roses. The buds cut in November, the least productive month, numbered forty. In March, April, and May they were very abundant.

The expense was small. The heating cost nothing. It required but little care. The only irksome thing was opening and closing the shutters, and that was inconsiderable.

The insect enemies were easily controlled. Quassia and smoke were both tried, the latter proving the better. Mildew was more troublesome. The Safrane, in particular, suffered from it. The ordinary remedies sufficed, but caused more trouble in their application than when hot pipes were used.

The varieties which did best were *Monsieur Furtado*, *Safrano*, *Bon Silene*; next came *Isabella Sprunt*, *Madame Bravy*, *Marie Van Houtte*, and *Catherine Mermet*. Perhaps I should add *Souvenir d'un Ami*. The least prolific were *Bougeri*, *Gerard Desbois*, *Perle des Jardins*, and *Marechal Niel*. The *Bourbons* blossomed moderately.

The connection with laundry and cellar is advantageous, not only because it prevents freezing at night, but also on account of moderating the temperature on sunny days. It is also self-regulating. The highest temperature is about 85°, the lowest 34°. The average day temperature is about 60°; at night it rarely sinks below 40°.

ANSON D. MORSE.

IMPATIENS SULTANI.

HEATING GREENHOUSES WITH OIL-STOVES.

The heating of small greenhouses remains still a most vexatious theme with the amateur horticulturist. The experience of a correspondent of the *Gardeners' Magazine* with oil-stoves leads him to offer the following advice:

Oil-stoves have undergone considerable improvement of late years, and those offered by the leading manufacturers are very efficient, and well suited for keeping the frost out of structures of small size. The houses for which the stoves are best suited are those not exceeding fifteen feet long and eight feet wide, as where larger, a hot-water apparatus will be much better. The employment of very large stoves with three or four burners is not desirable. The better course is to use stoves of medium size with two burners, and have two or three, according to the size of the house. For one of these dimensions three stoves should be obtained, and be used according to the severity of the

weather. During light frosts one would suffice to keep the plants safe, and with frost from twelve to twenty degrees of frost, two stoves should be used, and a third be brought into requisition when the frost exceeds twenty degrees. It is impossible to regulate the heat of an oil-stove to any considerable extent, and when one powerful stove is employed, the heat will be too great at one time and insufficient at another. But by the arrangement suggested, there will be no great difficulty in regulating the heat according to the weather outside.

Complaints are sometimes made of the stoves giving off an objectionable smell; but when I have used them I have not had any cause to be otherwise than well satisfied upon that point. I could, on entering the house, at once tell whence the heat was derived, but the atmosphere was by no means unpleasant. Much, of course, depends upon the way in which the stoves are managed,—the essential points being to use good oil, to keep the reservoirs well filled, and to trim with as much care as a table lamp.

PRESERVING OUT FLOWERS.

"What shall I do to keep my flowers fresh as long as possible?" asked a lady to whom the compliments of the season had just been tendered in the shape of a beautiful basket of flowers.

The worst place they can possibly be in to keep fresh, we replied, is just where they are, in the dry atmosphere of an air-heated parlor, close by the register. As they have, of course, to remain in this room, where they may be seen to good advantage, place them as close to a window and as far from the register as possible, but by no means open the lower sash so as to allow a current of air to pass over them; wind or strong draft will destroy them

as effectually as heat. Keep them sprinkled—bedewed, rather—with cool, but not icy water. An "atomizer" is an excellent apparatus for this purpose. During night put them in a cool place, but not where it freezes, and cover them with a dish-pan or any vessel large enough not to touch them; an empty box answers the purpose very well, or a basket overhung with wet towels. The object is to keep the atmosphere that surrounds them in the most favorable condition possible to prevent evaporation without inducing decay.

For vases and jardinières in which flowers are arranged, clear water is as good as anything. This should be renewed every day, and the flower stems cut off a little with a sharp knife, not broken off or cut with scissors, for these crush the fine tubes of the stems, and thereby prevent their power of absorption. Wilted flowers become quickly revived by putting them a few minutes in water as hot as the hand will bear.

THE SUNSET ROSE.

None of the many beautiful Rosos exhibited at the last meeting of the New-York Horticultural Society attracted so much marked attention as the now Tea Rose, "Sunset." The bunches of its brilliant flowers were indeed a sight worth beholding.

The "Sunset" Rose is a sport of the well-known *Perle des Jardins*. That is, a shoot of one of these plants produced flowers which, instead of the typical canary-yellow, were of a rich tawny shade of saffron and orange, similar to the color of the Saffron. Only a single cutting was secured; but in this, as well as in all its offsprings, the peculiar color of the flowers became perpetuated.

The flowers are, like those of its parent, very large, full, well formed, and borne on stiff stems. The mature foliage is very dark and glaucous, while the young leaves are of a remarkable and beautiful deep crimson tint; the leaflets are five to seven in number, and deeply serrated.

For winter forcing, the success and value of this new Rose seems to be already fully assured; and there can be little doubt that for summer blooming and outdoor culture it will prove not less valuable.

PERSIAN CYCLAMENS.

Persian Cyclamens are beautiful little plants and exceedingly profuse bloomers between January and March. A very large type of them is called *Giganteum*, and of the normal and *Giganteum* forms there are several named varieties of good merit. After growing a few of each I have concluded that, from a packet of mixed seed of some first-class strain, I can get as bright blossoms, as many of them, and often of as good form and substance, as I can from seeds of some of the named sorts. *Giganteum rubrum* has had the largest flowers, and *Giganteum brilliant* the deepest and brightest colored ones, with me. There are many hardy Cyclamens; but, except in cold frames, they have not proved very satisfactory in this country, and, even at their best, they are not so attractive as the Persian Cyclamens.

I sow my Cyclamens in a pot or pan of light soil as soon as I can get the seeds, say in February or March, and soon after they germinate prick them off into small pots, then pot them singly into 2½-inch pots and afterward into 3-inch ones. I endeavor to keep these young plants growing all summer, and in fall several of them may need to be repotted into 4-inch pots. In winter keep them near the glass; faintly shaded from strong sunshine and moderately moist,

most of them will blossom. After they have done blooming, say in April, I give them rather less water than before, but do not dry them off thoroughly, and in May, plant them out in an open frame; any piece of garden ground would do as well. I take no further heed of them during the summer months, except keep away weeds.

About the end of July or in August, they will begin to grow; then I lift and pot them, using well-drained pots and rich earth, and place them close together in a cold frame. For some time I water sparingly; but as they advance in growth, more copiously. They are taken indoors before there is danger from frost. These should blossom full in January, February, and March.

By raising a few seedlings every year (and

THE SUNSET ROSE.

every seed should come up without any trouble) you can always have a young, vigorous set of plants. I do not care about keeping Cyclamens over three years old. In potting Cyclamens I like to have the eorn rest upon the top of the soil, or, at most, be buried but to half its depth. But when I plant them out in the frames, I place the "roots" about an inch or half an inch beneath the surface. Some growers prefer growing their Cyclamens altogether in pots.

The autumn blooming species should be potted in August. *C. Europæum*, which is the best of this class, has very variable foliage, and produces red, rose, or pure white, deliciously fragrant flowers in August.

WM. FALCONER.

ACHIMENES.

For the decoration of the greenhouse and conservatory in summer there are but few plants, if any, more desirable and beautiful than the Achimenes and some allied genera of the family *Gesneraceæ*. Their flowers are of most delicate beauty, varying from pure white to rose, lilac, scarlet, and most brilliant crimson.

The little scaly bulbs or rhizomes should be set away as grown, and kept perfectly dormant in winter,—secure from extreme cold, the soil moistened sufficiently to keep the little roots from drying up and wasting their strength. Just here is the source of many disappointments when roots are brought up in the spring. They have remained in dry, hard soil so long that they have not sufficient vitality left to sprout, though seeming sound.

In February or March, they should be shaken out of the old soil and repotted in a light mixture of leaf-mold and sandy loam in well-drained pots, in groups or single specimens. Water moderately and keep in a warm, sunny situation until buds form, then move to a light but somewhat shady place. The blooms last longer and are prettier than when exposed to hot sunshine or winds. They bloom at the axils of the leaves, and will continue to grow and flower from early summer to late fall. When done flowering, withhold water gradually. They multiply rapidly and become great favorites wherever known.

AMATEUR.

ARRANGEMENT OF PLANTS.

In the arrangement of plants in the greenhouse, says Thomas Meehan, in the *Gardener's Monthly*, continual change is commendable. Every few weeks the plants may be reset, and the houses made to appear quite different. In the end, where the lowest plants once were set, now the taller ones may be placed; here a convex group, and there presenting a concave appearance. Drooping plants on elevated shelves, and hanging baskets from the roof, make little paradises of variety in what were once unbearable monotony.

Gardeners often wish to know the secret of maintaining a combined interest, on the part of their employers, in their handiwork, and this is one of the most potent: continued change and variety in the appearance of everything.

Beautiful flowers, graceful forms, elegant combinations, all develop themselves with a healthy luxuriansness, and ever changing endlessness will wake up an interest in the most indifferent breast.

Lawn and Landscape.

NEW CONIFEROUS TREES. SPRUCES.

First upon the list, and perhaps one of the most important gains of many years, is the Rocky Mountain Blue Spruce, *Abies pungens*. Its chief merits are great hardiness and beauty. So much disappointment has resulted from planting tender evergreens that planters generally are commencing to lay great stress upon hardiness, and it is right that they should do so. What advantage is there in growing fine specimens of rare species only to lose them as they reach perfection? Two years ago, when in Paris, I saw in every section of that grand city ruined specimens of noble and rare evergreens, which had taken years of patient attention and care to develop. To be sure; those extremes do not come every year, but we cannot place too much importance upon the qualification of hardiness. The Blue Spruce is the bluest of evergreens, and a well-developed specimen is a sight that will charm every lover of beautiful trees.

[Our illustration on the front page of this number, for which we are indebted to the *Gardener's Chronicle*, represents one of the largest and most beautiful specimens under cultivation. It is seventeen feet high, and stands in Professor Sargent's grounds at Brookline, near Boston. This magnificent tree, standing perfectly isolated on the velvety lawn, boldly contrasting against the bright green of the group of deciduous trees which form its background, produces one of the grandest arboricultural effects it ever was our fortune to behold, and to which neither words nor illustration can do full justice.—Ed.]

Abies parviformis is a dwarf Spruce of slow growth and small foliage. It is an excellent small evergreen, very hardy, and will be useful for small grounds.

Abies nigra Doumetti is a handsome form of the Black Spruce, of dwarf habit and compact growth.

PINES.

Pinus ponderosa, the heavy wooded Pine of California, has proved to be a valuable accession. It is perfectly hardy, of fine form, has long, distinct foliage, and is a vigorous grower.

Pinus Pallasiana has bluish foliage, and is hardy and beautiful.

Pinus Jeffreyi, from California, has also succeeded admirably, being hardy and very ornamental.

RETINOSPORAS.

The beautiful *Retinispora plumosa aurea* and *argentea* and *filicoides* are charming evergreens of moderate growth and medium size, and well adapted to plant in small places; but they are tender with us, and must be protected with a few branches of evergreens, or they will suffer in winter. Those who are willing to devote extra care and attention to them should introduce them to their garden by all means. But for the general planter in cold regions, we cannot yet recommend them.

JUNIPERS.

The Silver Variegated Japan Juniper, with foliage of a glaucous green color, and the Golden Japan Juniper, which has golden

yellow foliage all the year, are two varieties to be commended.

YEW.

The Golden Yew, *Taxus elegantissima*, should not be overlooked, nor should we forget the Pyramidal Arbor Vitæ, or Geo. Peabody, with its golden foliage. The Golden Yew and Geo. Peabody are undoubtedly the two best golden evergreens, and among the Arbor Vitæ there is nothing hardier or more handsome than the Pyramidal. The new varieties of Arbor Vitæ introduced by Mr. Robert Douglas are very promising.

It is a great satisfaction to those engaged in horticultural pursuits to know that there are always new pleasures to look forward to. With each year comes some new tree or plant to engage our attention and demand our care, and our interest is never permitted to flag, even for a moment. What a gratification it is to aid in the dissemination of a really valuable article! Joy enters the home when the new plant arrives; the new-comer is welcomed, receives the best of care from loving hands, and if it proves worthy, affords genuine happiness to the household. But if perchance the great expectations should not be realized, and the high-priced novelty should prove worthless, what sorrow and disappointment follow! Let us therefore exercise a care that we distribute only good things, and thus contribute to the welfare and happiness of our fellow-beings.—W. C. Barry, before the American Nurserymen's Association.

FORMING LAWNS.

In making new lawns there are a few simple rules to be observed, without compliance with which success cannot be relied upon. These are summed up in the *Country Gentleman* in the following concise manner:

1. Take plenty of time in preparing for them.
2. Grade moderately, rounding off sharp points or declivities.
3. Underdrain.
4. Plow and subsoil, if admissible.
5. Make the soil uniformly rich, deep, and even.
6. Harrow well and repeatedly.
7. Make several inches at the surface fine, rich, and mellow.

8. Sow the seed early in spring, at the rate of two bushels of clean seed per acre, raking, rolling, or brushing it in; or sow chaffy seeds, five or six bushels per acre.

Early in summer the surface of the ground will be a uniform green, soon after which begin to mow it, cutting high at first, and once in two weeks, and as the growth increases and strengthens, cut once a week. It is hardly necessary to add that the ground should be got ready in the autumn before sowing, so that the seed may be put in the first thing in spring.

Established lawns should be mowed as often as once every four or five days during the rapid-growing season, and less frequently later. If cut often enough, the grass need not be raked off, but left as a mulch. It is only when a taller growth is cut that raking is needed to prevent the dead grass from choking the lawn-mower at the next cutting. Late in the season set the mower to cut high, so as not to expose the roots. A well-made lawn will never need watering, as richness and depth of soil will obviate it.

Foreign Gardening.

GLIMPSES OF SOUTH AUSTRALIA.

The extremes of the climate and seasons of Australia offer to the horticulturist many difficulties in the cultivation of introduced plants not experienced elsewhere. The Report on the Progress and Condition of the Botanic Garden and Government Plantations at Adelaide, by director Dr. R. Schomburgk, from which we condense the following, furnishes much interesting information in this regard.

The summer season includes the months of December, January, and February, when the temperature on the plains frequently exceeds 100° in the shade, and reaches from 140° to 150° in the sun. The highest degree of heat in the shade ever experienced was 116°3'. On the 18th of January, 1882, the temperature registered 180° in the sun, and 112° in the shade. As the boiling point is 212° it will be seen that the heat in the sun on that day was within 32° of that temperature.

The Australian summer months are characterized by great heat, hot winds and dryness. Not a drop of rain falls often for six or eight weeks, and it is during this time that not only the acclimatized but the indigenous vegetation suffers materially. The ground becomes so hot and cracked that even the occurrence of a fall of rain serves only to clear the leaves from dust, as it evaporates in a very short time. During this period the country wears a desolate, sunburnt appearance, and is destitute of all green herbage; but after the setting in of the rains there is a magic appearance of grasses and herbage.

The autumn season includes in Australia the months of March, April, and May, and is one of the genial and beautiful parts of the year. The temperature falls rapidly, only reaching 70° to 80° in the shade, the mean being 64°6', and in the month of May it is only 58°2'. The northern winds become cooler, the solar radiation is considerably reduced, and heavy dews begin to fall at night. The indigenous vegetation which has suffered through the summer awakes to new life; and trees, shrubs, and herbage put forth fresh growth, while the leaves of the European deciduous trees get the autumnal tints, and drop.

June, July, and August constitute winter, — the rainy season, — which is usually marked by frequent rains and strong winds; but it also often happens that remarkably dry winters have to be contended with. The mean temperature during the three months is 54° to 55°7'. Hoary frosts and heavy frosts often appear during the night, which have since the last four years increased in severity, and the lowest temperature experienced was 28°.

The spring season — the most genial and most beautiful in South Australia, and probably not surpassed in any other part of the world — includes the months of September, October, and November, the mean temperature during the first two months being 60° to 70°. At this time of the year the gardens are in their best floral beauty — trees, shrubs, perennials, annuals, emulate each other in regard to their flowers, which are of such a size, richness of color and perfection, as a

northern gardener can scarcely imagine. But early-appearing hot winds in November destroy their floral beauties in the course of a few hours.

The average fall of rain during the year in the plains of Adelaide is twenty-one inches; but the distribution is unequal, even in places not far apart, each often showing a great difference in the rainfall.

From the foregoing it can be imagined that not all plants from other countries will grow here. The tropical and alpine ones suffer not only from the dry atmosphere, but the former also from the cold during the winter months.

Most fruits from other parts of the globe thrive luxuriantly in South Australia, and come to such perfection in size, and frequently in flavor, as is hardly known in other countries, and many fruits are found to improve materially by the change, the climatic conditions being manifestly favorable to them. Apples grow to great size, but do not always possess fine flavor, and contain more acidity. Pears, Peaches, Apricots, and Plums reach to large size and contain a good flavor. On the slopes of the Mount Lofty range facing the plains, fine Grapes of great size are grown, and the summer months ripen them to the greatest perfection. The wine produced often contains 25 to 30 per cent. alcohol.

All vegetables can be grown during winter and autumn on the plains, but in no comparison so successfully as in the gullies of the hills, where the finest vegetables and culinary herbs are raised throughout the year in great abundance. Cauliflowers about two feet in diameter are often seen in the market. Cucumbers, Water and Muskmelons grow to an extraordinary size and of good flavor. The South Australian cereals, especially Wheat, are considered the finest grown in the world.

When a new-comer visits for the first time the agricultural and horticultural shows, and observes the fine display of flowers, fruits, vegetables, and cereals in their utmost perfection, he must consider South Australia a favorable land; and it is indeed surprising that this fickle climate, with its extremes, drought, and hot winds, can produce such developed specimens of Nature's gifts.

ROTHSCHILD'S WONDERFUL ORCHID.

French horticulturists, says the *Pall Mall Gazette*, are at present greatly interested in a plant at one of M. de Rothschild's celebrated hot-houses at Ferrières, near Paris. Perhaps the strangest of the strange family of Orchids, *Vanda Lowi*, was discovered by H. Low, in 1847, in the hot, damp forests of Borneo, where it climbed to the top of the highest trees. Its long leaves, which not rarely measure a yard or more in length, appear small if compared with the length of the clusters of buds, which reach a length of three yards. Each cluster — of which there are at present eleven in full flower at Ferrières — numbers two hundred and eighty buds, all flowering at the same time, which are so different in appearance that side by side they may easily be taken for distinct species. The plant was bought in 1876 for a large sum of money, but at present it is considered worth \$25,000.

Horticultural Societies.

NEW-YORK HORTICULTURAL SOCIETY.

Notwithstanding the extreme cold and stormy weather, which made it almost impossible to transport tender plants and flowers any considerable distance without their becoming injured, there was a fair exhibition at the January meeting. Among the most meritorious exhibits were a magnificent collection of some twenty-five Orchids from George Such. A *Dendrobium Wardianum* had eight full flower spikes, most of them over a foot in length. Mrs. W. J. Morgan's collection of Orchids contained, among other superb specimens, an *Angraecum sesquipedale* and *Laelia autumnalis*. Samuel Heushaw showed as large and brilliant *Amaryllis Aulica* as we have ever seen. Hallock and Thorpe's collections of Geraniums, Carnations, and especially the new *Impatiens Sultani*, attracted deserved attention.

The excellence of the Roses seems to increase with every subsequent exhibition. The new "Sunset" Rose formed a prominent feature.

Charles E. Parnell exhibited a very large and meritorious collection of cut flowers. Several choice specimens of *Cinerarias* were exhibited by E. W. Parsons & Co.

The most tempting exhibit was two monstrous bunches of Barbarossa Grapes, weighing eight pounds together, and several choice bunches of Black Hamburgs from Louis Compu, gardener to Mr. Charles Butler, of Fox Meadow gardens. The vegetable department contained exceedingly well-grown Mushrooms, some of them seven inches in diameter, forced Tomatoes, Beans, Cucumbers, Asparagus, Radishes, etc., etc.

AN INTERNATIONAL EXHIBITION OF FRUITS.

The World's Industrial Exposition will open in New Orleans on the first Monday in December, 1884, and continue for six months. This will be in the largest sense a World's Exposition of Industry, and will in many essential features surpass any exposition heretofore held in this or any other country. The provisions being made for this great fair are of the most generous character. The Main Building, now in course of erection, will cover thirty-two acres of ground, and will give far more exhibition space than any structure heretofore erected in this country. An Art Building, an Agricultural Building, and a Horticultural Building, and other structures for special purposes, will all give most liberal accommodations to these several interests.

It has been decided by the Board of Managers to give the interests of Horticulture, especially those of Pomology, a larger place than they have held in any other fair in the world. In addition to the completest possible display of trees, plants, and flowers, there will be held an International Show of Fruits, organized and managed by the Mississippi Valley Horticultural Society.

From all indications, this will be the most extensive exhibition of its kind ever held on this continent; and the fact that it is under

the immediate superintendence of the capable and indefatigable president of the Mississippi Valley Horticultural Society, is in itself sufficient guarantee that it will be a grand success. It is to be hoped that every State and Territory will be represented by delegates, as well as by creditable exhibits.

Premium lists will be issued at an early day for distribution to all interested. All inquiries and applications for space should be addressed to Parker Earle, Cobden, Ill.

MASSACHUSETTS HORTICULTURAL SOCIETY.

Amid the difficulties which beset many of the Horticultural Societies of our large cities, it is encouraging to note the increasing prosperity of this staunch old organization, as indicated by the liberal amount of premiums offered for the present year.

At the meeting held January 5th, the appropriations recommended by the executive committee were unanimously voted, viz.: for premiums for plants and flowers, \$1750; fruits, \$1000; vegetables, \$550; gardens, \$150; library committee, \$400; committee on publication and discussion, \$150; committee of arrangements, \$300.

NEW JERSEY HORTICULTURAL SOCIETY.

The Ninth Annual Meeting of this organization, held January 22d and 23d at Camden, N. J., was one of the largest and most interesting in the annals of the society. Many of the papers read, and the discussion thereon, were of great practical value. All these will be published in the forthcoming *Transactions*, which to any fruit-grower and market-gardener residing in the State are quite indispensable. These, as well as the reports of the State Experiment Station, are furnished free to all members of the society, by addressing the secretary, E. Williams, Montclair, N. J.

NEW JERSEY STATE BOARD OF AGRICULTURE.

On February 5th and 6th, the annual meeting of the Board will be held at the State-House in Trenton. Arrangements have been made with the railroads to issue excursion tickets at reduced rates, and orders for such may be had by addressing the secretary, P. T. Quinn, Newark, N. J.

THE "CHRISTIAN INTELLIGENCER'S" OPINION.

THE AMERICAN GARDEN was an elegant magazine last year, very tastefully printed and illustrated, and is still more attractive in appearance this year with its new cover. We take pleasure in acknowledging our indebtedness to it for many useful hints and much important instruction. We await its appearance every month with eagerness, always expecting to find something we wish to know, and invariably finding it. As its name indicates, it deals especially with the fruit and flower and vegetable garden, and in that sphere has no superior in this country; but often treats intelligently, and with discrimination, of matters pertaining to the work and interests of the farmer.

During the past year we have cut from this journal ten times as much as the space at our command has allowed us to print, and we always see those extracts come back from the typesetters with regret.

NOTICES OF THE PRESS.

THE AMERICAN GARDEN is one of our most valuable and able exchanges.—*National Baptist.*

THE AMERICAN GARDEN is a handsome magazine, devoted to the cultivation of flowers, fruits, and vegetables. It is full of interesting suggestions regarding the best methods of cultivating plants of every kind, and cannot fail to prove a valuable acquisition and companion to every amateur horticulturist.—*Farago Republican, North Dakota.*

Every one of our readers can find a reliable adviser in THE AMERICAN GARDEN, a beautifully illustrated monthly journal, devoted entirely to horticulture, and designed to fill this want. In its columns of "Seasonable Hints" it tells just what to do each month in every department, and offers in its "Answers to Inquiries" columns to solve all the difficulties that so frequently beset and dishearten the horticulturist. You cannot invest \$1 better than to subscribe for this journal. Its publishers are well known as a reliable, enterprising concern, and we can assure our readers full value received in THE AMERICAN GARDEN.—*Laurel Enterprise.*

WHAT OUR SUBSCRIBERS SAY.

I take more interest in THE AMERICAN GARDEN than in any publication I have ever seen. It is the horticultural monthly of America.—*H. G., Highland Park, Ill.*

I think THE AMERICAN GARDEN is the best horticultural paper published. I can hardly wait for the next number to come.—*W. F. S. L., Huron, N. Y.*

The last number of THE AMERICAN GARDEN is the best yet published. You will have to make it a weekly within two years.—*Wm. Clapp (Editor Boston Journal).*

THE AMERICAN GARDEN is the best paper of the kind I have ever seen, and I like it so well I will not allow any number to be destroyed, but carefully preserve the file.—*S. M. S., Treasury Department, Washington, D. C.*

In renewing my subscription to THE AMERICAN GARDEN, I take the opportunity of expressing my high appreciation of its value. Any one who has had it for twelve months would, I am sure, miss it very much, if it were stopped from any cause.—*R. H., Montreal, Canada.*

I am very much pleased with THE AMERICAN GARDEN; it is the very thing every one that has a garden wants. Its colored plates are truthful and the most beautiful of the kind I have ever seen; and having been raised in one of the largest Rose nurseries of England, my experience in this direction is considerable.—*Ch. W. B., Pine Valley Mill, Utah.*

OUR BOOK TABLE.

Michigan State Horticultural Society. Report of the Fair of 1883. Chas. W. Garfield, Secretary, Grand Rapids, Mich.

Kansas State Board of Agriculture. Quarterly Report, containing acres, products, and value of field crops for the year 1883, and many other statistics.

Worcester County, Mass., Horticultural Society. Transactions for 1883; and Premium Schedule for 1884. E. W. Lincoln, Secretary, Worcester, Mass.

Injurious Garden Insects, by Dr. Byron D. Halsted. Number eighty-eight of the "Home College Series." An excellent condensed treatise on the subject. Published by Phillips & Hunt, New-York.

Agricultural Review and Industrial Monthly.—*New-York.*—The first number of the new series shows great improvement over the former magazine. It contains many excellent articles, and among its contributors are some of the best writers in the country.

Garden and Farm Topics, by Peter Henderson, *New-York.*—This neat volume of 250 pages contains a vast amount of practical information of interest and value to gardeners and farmers. Like all the author's works, it does not deal in speculative theories, but gives in plain, concise language, instructions and directions which may be

relied upon and followed implicitly. Among the leading chapters of the work are: Popular Bulbs and their Culture, Window Gardening, Propagation of Plants, Rose Growing, Greenhouse Structures, Formation of Lawns, Culture of Onions, Cabbage, Camellia, Celery, Strawberries, and other farm and garden crops.

Outing and the Wheelman, *Boston.*—During its two years of existence, *Outing* had become so endeared to us that we felt unfeigned regret when we read the notice of its combination with the *Wheelman*, as it seemed hardly possible that improvement could result from combining with any magazine. When the January number appeared, with *Outing* all on wheels, we perceived that our apprehensions had become verified. But, lo and behold, there comes the February number, not only full of the familiar ring of unlimited, universal outing, but refreshed, invigorated, rejuvenated; outing on the St. Johns in Florida, outing ever the Alps, outing under the Southern Cross, outing by the side of the Summer Sweetheart, outing at home, outing everywhere. Mr. Editor, we tender you our apology for doubting your ability to improve *Outing*; you have done it! Success to *Outing* and the *Wheelman*!

CATALOGUES RECEIVED.

Ellwanger & Barry, *Mount Hope Nurseries, Rochester, N. Y.* Descriptive and Illustrated Catalogue of Ornamental Trees, Shrubs, Hardy Perennial Plants, etc. This is the most complete and accurate catalogue of its kind that comes to our table.

J. T. Lovett, *Menmouth Nurseries, Little Silver, N. J.* Illustrated Catalogue of Small Fruit Plants, Trees and Plants; with colored plates of the Hensel Raspberry and the Jessica Grape. This is a handsome and carefully gotten-up catalogue, containing all the best in its line.

ANSWERS TO CORRESPONDENTS.

Celery Going to Seed.—*B. B. C., Fairville, N. B.*—Early sown Celery, especially when the plants receive poor treatment, and in very dry seasons, are apt to obey the natural laws and produce seed. The best preventive against seeding in Celery is plenty of manure and plenty of water. *Hollow Celery* is simply a reversion to the natural form. It is more common in tall kinds than in dwarfs.

Best Quinces.—*E. P., Bucyrus, O.*—Quinces vary considerably in their adaptability for certain localities. The *Apple* or *Orange* is the best in texture and quality; the *Pear* is a healthier grower, more productive, and ripens later. The *Champion* is very vigorous and productive, and an excellent keeper. In planting a Quince orchard we should advise to plant some of each variety.

Plant for Name.—*Mrs. C. H., Litz, Pa.*—It is not generally an easy matter to determine a plant from a single flower only; yet, in this case, we do not hesitate to name the plant *Campanula pyramidalis*, the pyramidal Bell Flower, a native of Carniola, and nearly allied to our common Harebell. It is one of the most beautiful and hardy biennial plants, and is also admirably adapted for pot culture. It is easily raised from seed. If well managed, the flower stems will grow to a height of six to eight feet.

About Tuberoses.—*Mrs. T. H. B., Somerset Co., Md.*—Tuberoses should never be planted before the ground is perfectly warm. Plant four to six inches deep. During winter they have to be kept in a warm, dry place. The offsets, or small bulbs at the base, are best left on during winter, removing them before planting. These may be set out separately, and most of them will produce flowering bulbs for the following year. Bulbs that have flowered already will sometimes bloom again; but if one wants to be sure of having flowers, it is not safe to run the risk.

Turning Plants in Windows.—*Mrs. N. D. N., South Haven, Mich.*—There is a popular prejudice against turning potted plants, and yet there is nothing more important to the formation of symmetrical, well-shaped plants than that all parts should be equally exposed to light and sun. This cannot be accomplished in a window unless the plants are turned about once a week.

With old, one-sided, shrubby plants this is of little use; but if young, healthy specimens are turned regularly they will always present a shapely appearance.

Winter-blooming Amaryllis.—*J. L. O., Fallston, Md.*—The bulbs should be kept dry and dormant during the latter part of summer and early autumn. When they show signs of growth, or when wanted to bring them to flowering, they should be repotted in soil consisting of sandy loam and leaf-mold, in rather small pots, say four to five inches. Place in a temperature of about fifty degrees, increasing the heat gradually to sixty or seventy degrees. Water moderately at first, and abundantly as their growth increases.

Ivory Soap.—Short articles have been going the rounds of the press commenting on the fact that the Ivory Soap people have the permission of Harper Brothers to use the back of their magazine for March, they paying fifteen hundred dollars for the privilege. Such advertising is sure to pay, for an article of merit, if properly presented, is certain to attract the attention of the intelligent and discriminating, to which class the readers of Harper's belong. It pays to advertise a good article in a good medium.

NOTICE TO ADVERTISERS.

The March issue of THE AMERICAN GARDEN will contain a superb Colored Plate of Pansies, and will be an unusually attractive number. It will have an extra large circulation, and offers superior advantages to advertisers who desire to bring their goods to the notice of the best class of buyers.

Advertisements, to insure space, should be received before the 20th of the preceding month. For advertising rates, see second page of cover.

Gouraud's Oriental Cream is indorsed by several of our lady readers as perfectly harmless, as much so as spring water, and that it has a magic influence upon the complexion which cannot be over-estimated or believed until realized. The celebrated actress, Lillie Hinton, writes: "I cordially recommend Dr. T. Felix Gouraud's 'Oriental Cream Magical Beautifier,' as it is perfectly harmless."

European Excursions.—Parties who contemplate visiting Europe will do well to correspond with Dr. E. Tourjee, Boston, the leader of so many pleasant trips over the ocean, who will send a descriptive pamphlet free to all applicants. The *Christian Union* says: "Dr. Tourjee's excursions are the most satisfactory, the best planned and conducted, and embrace a wider range of travel than any other of the excursion tours."

IMPORTANT.

When you visit or leave New-York City, save Baggage Expressage and Carriage hire, and stop at the Grand Union Hotel, opposite Grand Central Depot. 600 elegant rooms, fitted up at a cost of one million dollars, reduced to \$1.00 and upward per day. European Plan. Elevator. Restaurant supplied with the best. Horse cars, stages, and elevator railroad to all depots. Families can live better for less money at the Grand Union Hotel than at any other first-class hotel in the city.

BRAIN AND NERVE FOOD.

FROM THE NERVE-GIVING PRINCIPLES OF THE OX-BRAIN AND WHEAT GERM.

Vitalized Phosphites.—Restores the energy lost by nervousness, weakness, or indigestion; relieves lassitude and neuralgia; refreshes the nerves tired by worry, excitement, or excessive sensibility, and strengthens a failing memory. It aids wonderfully in the mental and bodily growth of infants and children. Under its use the teeth come easier, the bones grow better, the skin smoother, the brain acquires more readily and sleeps more sweetly. An ill-fed brain learns no lessons, and is peevish. It gives a more intellectual and happier childhood. Not a secret remedy; formula on every label. For sale by Druggists, or mail, \$1. F. Crosby & Co. 664 & 666 Sixth Ave. New-York.

TAKE NOTICE.

For 50c. (in stamps) 200 Elegant Scenery Pictures—No two alike. F. WHITING, 50 Nassau St., N. Y.

**A Present to Every Subscriber
TO
THE AMERICAN GARDEN.**

While we offer a choice of many fine things to those who take time and trouble to aid the publishers in extending the circulation of THE AMER. GARDEN, as a recognition of their kind efforts and as a Reward or pay for such aid; and while we intend to and shall make THE AMERICAN GARDEN worth to every reader many times its small cost, yet we desire to give a friendly recognition of some direct kind to each one of our readers as far as possible; and having unusual facilities for securing valuable seeds, etc., desirable for use or for trial, we offer to every subscriber to THE AMERICAN GARDEN his or her own choice of any one of the Seed, Plant, or Bulb parcels named below.

THIS OFFER IS TO EVERY SUBSCRIBER, for one year, whether subscribing singly, or in Premium or other Clubs.

In sending your subscription or giving it to club gatherers, give in each case the letter indicating what you desire.

Our readers will notice that many of the things named are new and rare, and of extraordinary merit. To purchase those (if they could all be bought) would cost 25 to 50 cents each.

POSTAGE FREE. All the articles offered as presents below will be sent postage prepaid.

FLOWER SEEDS.

Directions for culture are given with each package.

A. Wild Garden Seeds.—A half-ounce packet. This novelty in flower gardening, which was first introduced as an AMERICAN GARDEN premium, continues to be a general favorite; and being in greater demand than ever, we retain it among our premiums. The present selection contains over 100 varieties of choice flower seeds, which, in single packets, could not be bought under \$5.00.

B. Single Dahlias.—A packet of seeds carefully selected from over 100 varieties, comprising all the most brilliant and decided colors. If sown in early spring, in pots in the house or in the hot-bed, flowering plants may be had by mid-summer.

C. German Pansies.—A packet of fifty seeds of these lovely flowers, of which one can never get tired. The seeds here offered are from the best and choicest collection in Germany.

D. Asters, Choicest Mixed.—The most desirable and valued varieties of the best German and French strains, are represented in these packets, which are vastly superior to what is generally known as Mixed Asters.

E. Everlasting Flowers.—A mixed packet of 12 distinct varieties. This class of flowers is constantly increasing in favor; and for winter bouquets and decorations generally nothing is more treasured. All are annuals of easy culture.

F. Ornamental Grasses.—A mixed packet of the twelve best varieties. As an accompaniment of flowers, fresh or dried, in bouquets or vases, nothing can be more appropriate and graceful than sprays of ornamental grasses.

VEGETABLE AND FARM SEEDS.

G. Pea, Bliss' Ever-bearing.—A sample packet of this extraordinary new wrinkled Pea, which is now, for the first time, offered to the public. For large yield, excellent quality, and continuance of bearing, it has no equal.

H. Cauliflower, Sea-Joan.—One packet. This valuable new variety combines more desirable qualities than any of the older kinds; in size and beauty, and especially in reliability of heading, it excels all others.

I. Water-melon, American Belle.—One packet, now first introduced, and of great value for home use as well as for market. It is very large, early, and of delicious quality.

J. Oats, Black Champion.—A sample package. These Oats were selected from a number of varieties received from Europe, and are of great promise. Selected heads have averaged one hundred and sixty-nine grains. The roots tiller more abundantly than those of any other variety, so that half the quantity of seed usually sown per acre is sufficient.

K. Barley, Imperial.—A sample packet. All reports about this new variety speak in highest terms of its excellence. In yield and quality alike, it is a valuable acquisition.

L. Potato, Tremont.—One tuber. A medium early variety of excellent quality; now offered for the first time.

M. Potato, Iroquois.—One tuber. A large, handsome variety of good quality, large yield, and superior keeping quality; now first offered. Both varieties received First Class Certificates of Merit by the London Royal Horticultural Society at the recent great International Potato Exhibition.

PLANTS AND BULBS.

N. Helianthus multiflorus, fl. plen. Golden Sunflower.—A hardy perennial plant of great beauty, grows about four feet high and bears a profusion of rich golden yellow flowers of the size of Dahlias.

O. Polyantha Rose, Mad. Cecile Brunner, the Fairy Rose.—This is an entirely new class of Roses of dwarf habit, with bright flowers of exquisite fragrance, hardy and effective.

P. "Curiosity," a new early flowering Pompon Chrysanthemum, with brilliant, deep-bright crimson flowers tipped with golden yellow. This choice variety just introduced here is not for sale, but is offered only as a present to our subscribers.

Q. Clematis coccinea (Scarlet Clematis).—One of the most desirable climbers for covering verandas, trellises, arbors, screens, etc., as it grows from eight to ten feet in one season. Its coral-red flowers are produced in great profusion.

R. Eulalia Japonica zebrina.—A remarkably handsome variegated grass, perfectly hardy, growing to a height of six to seven feet, and producing tall, elegant plumes, highly ornamental for vases.

S. Lilium Wallacei, recently introduced from Japan. Flowers four to six inches in diameter, of clear buff-orange color, distinctly spotted with numerous black dots. The bulb is small but perfectly hardy.

T. Amaryllis Treatet, the Fairy Lily.—A delicate, pure-white flower, two to three inches in diameter, borne on slender stems 5 to 6 inches high. Suitable for the garden or house.

U. Strawberry, the Prince of Berries.—3 plants. For complete description and life-size illustration of this really superb Strawberry, see AMERICAN GARDEN, August number.

For other Premiums see General Premium List, mailed free on application.

"ONE CENT WELL SPENT!"

Send a Postal Card for the

AMERICAN GARDEN PREMIUM LIST.

Very Desirable, Useful, and Excellent

PREMIUMS

INCLUDING

A VALUABLE PRESENT...FREE to Every Subscriber to The American Garden.

SIXTY MOST VALUABLE ARTICLES, all of guaranteed, first-rate Quality, including many wanted in every Home, and by Every Person, Young or Old. Read the Descriptions in the Premium List.

FINE PRESENTS for HOLIDAYS, and all other days; for Wedding Gifts, and to Friends.

(See Premium List.)

DELIVERED RIGHT TO YOU, FREE, no matter how far off the Good Articles in the Premium List will be delivered, **CARRIAGE PREPAID**, to any place in the United States or Territories, however near or distant, whether given as premiums, or supplied at the prices named.

N. B.—The articles not offered "delivery free," will be carefully packed without charge, and forwarded by express or otherwise, as may be desired. The expenses of carriage will not be great. They can be taken at the office of AMERICAN GARDEN without expense.

GOOD THINGS TO BUY. Aside from any articles obtained free as premiums, almost every one will need, or desire to purchase some of the **EXCELLENT THINGS** described in the Premium List when they can get them of **GUARANTEED QUALITY**, and from a **RESPONSIBLE SOURCE**, and at the **LOWEST PRICE** they can be obtained anywhere of such excellence. A Price is therefore named with **EACH** article at which we will supply it delivered **FREE**, or otherwise, as above provided.

ENTERTAINING AND INSTRUCTIVE READING.—See in the Premium List what is said about "Dips," an amusing scene; six "Watch Items," especially the 7th; about "Washing Made Easy;" "Microscopes;" and a score of other things.

This reading will interest you, aside from what is said of the particular things referred to.

A DOLLAR an HOUR can easily be secured by many persons, **LADIES** included, (also by **BOYS** and **GIRLS**), thus: Show to friends and neighbors a specimen copy of the *American Garden*, its beauty and usefulness, and low cost. An hour's time should suffice to get 2, or 3, or 4 to take it. This will give you a dollar's worth, or **MORE**, of the valuable articles in the Premium List—articles better than their money cost. Why! it would pay many persons to continue this as a constant employment, and sell the premium articles received when not needed by themselves. **N. B.**—Any Premium club may contain subscribers from many Post-Offices.

ALSO NOTE, that in addition to your premium you can offer to every subscriber a **FREE** Premium, as noted in preceding column. (Several of these Seed and Plant parcels will be worth a full Dollar, or more, leaving the Journal free.)

THE AMERICAN GARDEN is a Large, Beautifully Illustrated Journal, printed on fine paper. It is specially devoted to **GARDENING**, **FLORICULTURE**, **Fruit Culture**, and to **Horticultural** interests generally. It is of **GREAT VALUE** in every Garden or Lawn, on the Farm, in the Village, or in the City. The Editors and Contributors are men who write and speak from their own large daily experience and observation. **LADIES** will find it especially useful in caring for their Flowers and Plants indoor and outdoor. (The Garden is by far the best paying plot on the farm, and adds immensely to the comfort and healthfulness of the home table. The AMERICAN GARDEN will add many dollars to the products of even the smallest plot.)

What Others Say. Attention is invited to the Border of the first page of the Premium List giving a few of the multitude of similar **voluntary** expressions, coming from those who are and have been its readers for years past. The Editors and Publishers pledge themselves to make **THE AMERICAN GARDEN** increasingly valuable by their most earnest efforts, by additional assistance, and by Liberal Outlay for **Illustrations**, gathering information, etc., etc.

TERMS—One Dollar a year, **Mailed Free** (This includes the valuable parcel of Plants, Seeds, etc. See preceding column. 3 months' trial trip, 30 cents. Single number, 10 cents. Sample copy and Premium List **FREE**. Ditto, with colored plate, 10 cents.)

VALUABLE PREMIUMS
To every Yearly Subscriber to

The American Garden,

A MONTHLY ILLUSTRATED JOURNAL, DEVOTED TO
THE GARDENING INTERESTS OF AMERICA.

ONE DOLLAR A YEAR.

Specimen Copies, free.
In clubs of six for one year.....\$5.00

Additional subscribers in clubs over ten, 75 cts. each.
This elegant and richly illustrated journal,

Edited by Dr. F. M. HEXAMER,

contains twenty large pages of closely printed matter relating to the Vegetable, Fruit, and Flower Garden, the Lawn, Greenhouse, and Window-Garden, Rural Life, Sanitary Improvements, and all branches of Horticulture in its various departments.

Volumes commence with the January number, and it is desirable that subscriptions should begin with the first number of the volume, although they may be entered at any time for a year from the date of entry.

BOUND VOLUMES.

Volume III. (1882) and Volume IV. (1883) have been carefully indexed, convenient for ready reference, and bound in handsome heavy paper covers. The amount of useful, practical horticultural information contained in those volumes cannot be obtained in any other books for the same price, making them most valuable additions to any library. Price, \$1.00 each by mail, post-paid, or

Free as a Premium

for a club of four at \$1.00 each, without single premiums to the subscribers; or free to the sender of a club of ten at seventy-five cents each, entitling each member of the club to a premium the same as those subscribing singly.

A PREMIUM FOR EVERY SUBSCRIBER.

Encouraged by the success of the premiums sent out in previous years, and desirous to introduce THE AMERICAN GARDEN into every home, we offer special and most liberal inducements for the current year. All articles offered are of actual merit and decided acquisitions, and several of them are now introduced for the first time.

A COMPLETE LIST,

enumerating and describing all the premiums offered to yearly subscribers, will be mailed free to all applicants.

A PRACTICAL FARMER'S JOURNAL.

THE NORTH BRITISH AGRICULTURIST

Price 3d.; By Post 3½d. Post Free for One Year, 14s.

OFFICE: 377 HIGH ST., EDINBURGH.
LONDON OFFICE:
145 Queen Victoria St. London, E. C.

The AGRICULTURIST is the only Farmers' Journal printed and published in Scotland. It is essentially a practical paper, being issued exclusively in the interests of Agriculture, and treating of that subject in all its branches, prominence being given to Veterinary Science, Agricultural Chemistry, Dairy and Poultry Management. Breeders of high-class Pedigree Stock will find in it much accurate information on points of interest to them.

The AGRICULTURIST is published every Wednesday afternoon in time for the Evening Mails, and from its very large circulation among farmers and landowners in England and Scotland it is a first-class journal for advertising.

Farms to be Let; **Farms for Sale;** **Sales of Pure-bred Stock,** such as Shorthorns, Herefords, Alderneys, Clydesdales, etc.; **Agricultural Estates for Sale;** **Agricultural Seeds;** **Artificial Manures;** **Agricultural Implements;** **Machinery and Engines.**

Money Orders should be made payable to CHARLES ANDERSON, Edinburgh.

VALUABLE TESTIMONIALS.

DUNN & SCHURK Boarding and Sales Stables, 148 East 24th St., New-York, Ang. 1st, 1883. ELLIS SPAVIN CURE CO. Dear Sirs: We were having an occasion to put a valuable horse in condition for a race. In giving the horse his work he threw out a curb, in consequence of which I would have sold him, at that time, for three hundred dollars (\$300), or less. Hearing of Ellis's Spavin Cure Liniment, I tried it with good results. In two weeks the curb was gone and the horse was going sound. I put him in condition again, and in two months we sold him for as many thousands as we valued him worth hundreds when I had the curb. The horse is at present boarding at our stable and being driven on the road every day. We can safely recommend your Spavin Cure Liniment for all bone diseases and callous lumps of any kind, if properly used. Yours, with respect, DUNN & SCHURK.

STARBUCK PLACE STOCK FARM, FULTONVILLE, Montgomery Co., N. Y., July 24, 1883. THE ELLIS SPAVIN CURE CO.—Gentlemen: Remedies received in good shape. Send me a glass sizer by express, to Fonda, well packed, and I think it will come all right. Also send me some of those cards with a horse head and shoe on. I have taken of several curbs, "one very bad"; cured a case of Sweeney and Navicular disease with the Spavin Cure, and restored several worn-out horses with the Powder. Yours respectfully, CHARLES QUINTIN, V. S.

J. H. Whitson & Son, 24th St., N. Y., say: "We have used Ellis's Spavin Cure in our stables for two years, and have tried it on the following with perfect success: Splints, curbs, ring-bones, bunions on the neck, swollen ankles, also quinsy sore throat, and the general stable ailment it is the best article we have ever used."

"I would gladly recommend your Spavin Cure to all, with perfect confidence as to the result," writes H. C. Perry, V. S., Boston.

"We believe Ellis's Horse Remedies to be 'the best articles on the American market.'"—Strauss & Timmon, East 24th Street, New-York City.

"Too much cannot be said in praise of your most valuable remedies," says Langam Bros., N. Y.: "we have produced results with them such as we have not been able to do with any others."

Send for free book of testimonials, describing all our specialties. ELLIS SPAVIN CURE CO. Boston, Mass., and New-York City.

B. K. BLISS & SONS, 34 Barclay Street, New-York.

\$500.00 IN PREMIUMS

Offered for the Largest Yields of PRINGLE'S NEW CEREALS, From One-Quarter Acre of Ground.

PRINGLE'S AMERICAN TRIUMPH OATS. This is a cross between the Excelsior and Waterloo Oats, combining in a remarkable degree the excellent qualities of both. The average height, as the grain stands in the field, is six feet, yet the straw is so strong and firm that it holds up well, without lodging, the tall luxuriant heads filled with plump, heavy grains. The quality and productivity of the grain are unexcelled, yielding from 50 to 100 bushels per acre, according to the condition and state of fertility of the land. Prices: By mail, \$1.00 per lb.; 3 lbs., \$2.50, post-paid. By express, at purchaser's expense, per peck, \$4.00; bush., \$12.00.

PRINGLE'S ADAMANT SPRING WHEAT. In this beardless variety we have one of the hardest and most flinty varieties in cultivation, very productive, hardy, and vigorous. Straw yellowish-white, very stiff and erect, averaging 4 feet in height. For cultivation in North-west, Colorado, and the Pacific coast, where hard wheat is the favorite sort, we are confident that this will be particularly desirable. Prices: By mail, \$1.00 per lb.; 3 lbs., \$2.50, post-paid. By express, at purchaser's expense, per peck, \$4.00; bush., \$12.00.

PRINGLE'S GREEN MOUNTAIN SPRING WHEAT. This is another beardless variety of great promise. It has been grown for the past two years by one of the most experienced wheat cultivators in Northern Vermont, in close proximity to the Green Mountains, who pronounces it the best he has ever grown. The straw averages about 4 feet, light yellow, very strong, and free from rust. Heads average 4 to 5 inches in length, somewhat tapering; kernels white, large, and plump. Very hardy and productive. Prices: By mail, \$1.00 per lb.; 3 lbs., \$2.50, post-paid. By express, at purchaser's expense, per peck, \$4.00; bush., \$12.00.

The above varieties were first offered by us last Spring, and were extensively grown throughout the country during the past season, and furnished ample proof of their excellence and superiority over the older varieties. To induce as extended a trial as possible, we offered liberal premiums to those who produced the largest quantity of grain from one ounce of either of these varieties. The result is marvelous and shows what can be accomplished by superior seed and good cultivation. The largest yields are as follows: The Triumph Oats produced 168 lbs., Adamant Wheat 108 lbs., and Green Mountain Wheat 71 lbs., each, from one ounce. The full report of the awards will appear in our Novelty Sheet, published in February, and will be found of interest, as some valuable information and suggestions about grain-growing are given. A copy will be mailed to all applicants.

NEW VARIETY SPRING WHEAT FOR 1884.

Pringle's Invincible is a beardless variety of remarkably robust and vigorous growth; the straw is strong, stiff, well glazed, healthy, and stands up well in all kinds of weather. The heads are four to five inches long, very compact, and uncommonly well filled; berry of light amber color, plump, hard, and very heavy. It is wonderfully prolific; a bushel will easily produce fifty to seventy bushels, if properly cultivated. To obtain such results, however, the seed must be sown thinly in drills, thirty to forty pounds of seed per acre being an ample quantity. The grain ripens quickly and remarkably evenly; care should therefore be taken not to let it get over-ripe before harvesting. As the result of many extensive trials, during the past five years, in various sections of our country, under irrigation and without, we do not hesitate to recommend this new Wheat in highest terms to every wheat grower in the world, fully convinced that it will everywhere give good satisfaction, yield profitable returns to the grower, and prove second to none for milling purposes. Price, \$1.00 per lb.; 3 lbs., \$2.50, by mail, post-paid. By express, at purchaser's expense, per peck, \$4.00; bush., \$12.00. Every one can compete. No restrictions, except the seed must be bought of us this Spring. Descriptive circulars, with full particulars, mailed free on application.

B. K. BLISS & SONS, 34 Barclay St. New-York.

COLLECTIONS OF SUMMER-FLOWERING BULBS.

Having secured a large stock of choice Summer-flowering bulbs, we are pleased to offer the following collections at a great reduction from regular prices. Collection X, containing One each of Tigridia Conchiflora, Grandiflora, and Grandiflora Alba; One Valletta Purpurea; One Dozen Oxalis, assorted; Six finest mixed Gladioli, and Six Tuberoses. Price, \$1.50. Collection Y, containing Two Tigridia Conchiflora; Two Tigridia Grandiflora; One Tigridia Grandiflora Alba; One Valletta Purpurea; Two Dozen Oxalis, and Tomifolium; One each Lilium Auratum, Longifolium, and Tomifolium; Twelve finest mixed Gladioli, Six Tuberoses, and Three Amaryllis Formosissimum. Price, \$3.00. Collection Z, containing Six choicest named Gladioli; One Dozen finest mixed Gladioli; Two Valletta Purpurea; Two each of Tigridia Conchiflora, Grandiflora, and Alba; One each Lilium Auratum, Cundidum, Tomifolium, Speciosum Album, Coridion, and Roseum; Two Amaryllis Formosissimum; Two Dozen Oxalis, assorted, and Twelve Tuberoses. Price, \$5.00.

Randolph's Hand Seed-Sower.

For sowing all kinds of small Garden Seeds with accuracy and its patch. It is easily operated by a lady or a child of ordinary intelligence, with a little practice. Its construction is so simple that it is not liable to get out of order. Descriptive Circulars mailed in all applications. Price, \$1.25 each. Sent by mail, post-paid to any address, for \$1.50. A liberal discount to agents.

B. K. BLISS & SONS, 34 Barclay Street, New-York.

Bliss's Illustrated Potato Catalogue. — Contains a list of 500 varieties of Potatoes, embracing new and very promising varieties, with explicit directions for culture, and much other valuable information respecting this indispensable essential. 10 cents.

TWO NEW TOMATOES.

THE CARDINAL.

This new Tomato has been carefully cultivated and subjected to many tests during the past year or two, and has maintained a remarkable perfection in all that can be desired in a Tomato. It is of vigorous growth, yet comparatively compact in habit, and, weight of fruit considered, is the most productive variety known. The fruits are perfect in shape, being uniformly smooth and free from ridges, and is of a brilliant cardinal red. Although firmness of seeds is a claim made for every new Tomato, it is a fact that by actual weight and measure tests THE CARDINAL has at least one-third less seed than the very best of the other varieties, and the thickness of pulp is most remarkable. It gives promise of being a good shipping sort, as ripe fruits picked in midsummer have kept in fine condition for ten days. The decided points of merit as described puts THE CARDINAL ahead of all other Tomatoes. Were it not so, there would be no need of adding another to the already large list of varieties.
Per pkt. of 30 seeds, 25 cents; 5 pkts., \$1.00.

KING HUMBERT.

A European novelty, recommended on account of its earliness, handsome form, and delicious flavor. The raiser describes it as follows: "Of the size and shape of a large plum, scarlet, very smooth and glossy, contains but few seeds, and in flavor closely resembles that of an apple of fine quality. None of the Tomatoes known to us equal in productiveness this fine sort, which is also one of the earliest, and will probably be found well adapted for northerly districts."
Per packet, 25 cents.

SEEDS WORTH GROWING! TWO NEW PEAS.

Bearing until Frost.

Encouraged by the flattering and unprecedented success which Bliss's American Wonder Pea has met in all parts of the civilized globe, it affords us great pleasure to offer now two other new varieties by the same originator, the late Mr. CHARLES ARNOLD, of Canada, which, we are confident, will be received with no less favor.

BLISS'S ABUNDANCE.

Half dwarf, 15 to 18 inches high; foliage large, thick, full, and dark green; pods 3 to 3½ inches long, round, wrinkled peas of excellent quality.

It ripens second early, being fit for the table about one week after the earliest kinds. The most striking feature of this variety is its remarkable tendency for branching directly from the roots, forming a veritable bush. Many plants throw out six and more branches, each of which becomes literally covered with blossoms and pods in such ABUNDANCE that the quantity produced by each branch would be considered a bountiful yield for an entire plant of many of the older varieties. In succession to the American Wonder for home use or market, this variety presents more desirable points than any other we are acquainted with.

Sold in packets only, 25 cts. each; 5 pkts., \$1.00

BLISS'S AMERICAN WONDER PEAS.

Extra Early, Very Dwarf (8 to 10 inches), Requires no Bushing, Exquisite Flavor.

With the introduction of our now world-famed AMERICAN WONDER, the highest degree of earliness and productiveness, combined with excellence of quality, has been secured.

ABUNDANCE adds another link to the unceasing continuance of abundant and delicious supply through midsummer, while EVERBEARING extends the chain of the richest and most valued products of the garden and field through Summer and Autumn, thus furnishing an uninterrupted and never failing supply from the earliest days of Summer till the relentless frosts and winter snows lay low our plants and bid the gardener rest.

On account of the scarcity of seed of these TWO NEW VARIETIES, we shall not offer them in larger quantities than one-fifth pint packets, 25c. each, or 5 packets for \$1.00.

American Wonder. Per packet, 20c.; pint, 40c.; quart, 75c., by mail, post-paid. If by express, at expense of purchaser; pint, 30c.; quart, 50c.; pck, \$2.50.

Bliss's American Racer.—After trial, in almost every section of the country, this Pea has proved very early, exceedingly productive, and in general good quality surpasses all other tall-growing early, yellow, smooth varieties. It continues in bearing several weeks, and grows from three to five foot high. Per pkt., 20 cents; pint, 45 cents; quart, 75 cents, by mail, post-paid.

One packet of each of the four varieties will be mailed to any address in the United States for 80 cents.

BLISS'S EVERBEARING.

The want of a reliable first-class Pea for Summer and Autumn use has long and seriously been felt by every one. With this new and remarkable variety, we are confident to place before the public a Pea which, when sufficiently known, will everywhere be recognized as the main dependence for a Summer and Autumn crop. Season late to very late; height of vines, 18 to 24 inches; foliage very large, firm, and bright green; pods 3 to 4 inches long on the average, six to eight peas in each pod, wrinkled as the preceding; quality unsurpassed in sweetness as well as flavor. We do not hesitate to say that, for continuance of bearing, this variety is unequalled, if equaled, a characteristic which gives it special value for late Summer and Autumn use. After repeated pickings, the vines continue to be covered with blossoms and buds, developing to maturity in turn until cut down by frost, making it practically as perpetual a bearer as can be found in the Pea tribe.

Sold in packets only, 25 cts. each; 5 pkts., \$1.00.

HENDERSON'S NEW CELERY—WHITE PLUME.

The introduction of this new and distinct variety bids fair to so simplify the culture of Celery that the most inexperienced can grow it in proper condition for the table with the same facility as they can a cabbage or Lettuce. The stalk and portions of the inner leaves and heart are naturally white, so that by closing the stalks, either by tying them together or by pressing the soil up against the plant with the hand, and again drawing up the soil with the hoe or plow, so as to keep the soil that has been squeezed against the Celery in place, the work of blanching is completed. The great advantage of this over the slow and troublesome process of blanching required by all other sorts is evident. Its eating qualities are equal to the very best of the older sorts, being crisp, solid, and of a pleasing, nutty flavor, while its white, feather-like foliage places it ahead of all others as a table ornament. Per pkt., 50 cents.

NEW FRENCH CELERY—GOLDEN-YELLOW LARGE SOLID.

A French variety, claimed to be self-blanching to a very remarkable extent, the outer ribs even assuming, without any of the tedious processes usually resorted to when blanching, a creamy-white color of a fresh and very pleasing appearance. Per pkt., 25 cents.

SQUASH—OLIVE.

A novelty from France, now offered for the first time. The shape and color of the fruit are exactly like those of an olive; in weight it ranges from six to ten pounds; the skin is smooth and extremely thin, and of a pale thick, firm, of a golden-yellow color, and of remarkably good quality. Per pkt., 25 cents.

NEW EARLY RHUBARB—"PARAGON"

This variety, although now offered for the first time in this country, has had extensive trial in England, and has more than verified the claims made for it. It is unquestionably one of the finest varieties of Rhubarb ever offered, being the earliest of all and wonderfully prolific. The crowns and stalks are produced in such profusion that more than twice the weight can be gathered from "PARAGON" than from any other sort. It has also the qualification over all others that it NEVER SEEDS, a claim that we have tested and found well sustained last Summer. The leaves are remarkably small, while in color the stalks are a beautiful bright red, and in flavor unsurpassed. Price, strong plants, 75 cents each; \$7.50 per dozen.

For further description of above and other Novelties, see our HAND-BOOK FOR THE FARM AND GARDEN (mailed for 6 cents to cover postage).

B. K. BLISS & SONS, 34 Barclay Street, New-York.

1884. SEASON 1884.

1884-SPRING-1884. TREES
 Now is the time to prepare your orders for NEW and RARE Fruit and Ornamental Shrubs, Evergreens, ROSES, VINES, ETC. Besides many desirable Novelties, we offer the largest and most complete general stock of Fruit and Ornamental Trees in the U. S. An abridged Catalogue mailed free. Address **ELLWANGER & BARRY, Mt. Hope Nurseries, Rochester, N. Y.**

Every grower of Roses will hail with delight this exceedingly valuable new Rose, the most important addition to our list of Roses since the advent of *Perle des Jardins*, from which it is a sport. It is an exact counterpart of this hitherto unequalled Rose, having the same robust growth, etc., except that the color is entirely different—a rich tawny shade of saffron, somewhat deeper than the old thing like, but deeper than the "old Safrane," or "Mme. Falcet," commonly known as "Tea Roses." The value of so good a Rose of this color, but with every valuable characteristic of the "Perle," cannot be overestimated. It will be as largely grown as the "Perle," and much more profitably, as the buds during the winter of 1884, sold for just double the price of "Perle." For outdoor planting, it is equally desirable, because the buds are so large and full, of splendid form, opening perfectly, and remaining so for a long time. For full description, see our illustrated catalogue for 1884. Sent free to all readers of *The American Garden*. Many other valuable novelties. Address

F. R. PIERSON, Florist, Tarrytown, New-York.

HANSELL The earliest and most valuable Raspberry, large, bright crimson, very firm, productive, extra hardy North and South. **EARLY HARVEST**, the earliest and most profitable Blackberry. **ZABRIL & DANIEL BOONE** Strawberries. Richly illustrated Catalogue, with honest descriptions, truthful pictures, and fair prices, free. It tells what to plant, how to plant, and how to get and grow Fruit Trees and Plants; the finest and most useful catalogue of the kind published. J. F. LAFAYETTE, Little Silver, New Jersey, Introducer *Guthbert Raspberry* and *Manchester Strawberry*.

CHOICE PLANTS for every one at WHOLESALE RATES.

We call especial attention to this feature of our business. We are largely engaged in sending plants long distances, and we have everything so systematized, and grow such quantities of everything, that we are enabled to reduce the expense of growing plants to the lowest cost, and we offer plants of all kinds at the very lowest rates consistent with high quality. Our large illustrated catalogue, with colored plate of *Eulalia Japonica Zebra* (the zebra grass), and colored plate of the wonderful new currant, "Fay's Prolifer," finely illustrated with numerous engravings, etc., is just what you want if you have a garden, as it tells you where to buy the best for the least money. Give us a trial order, and see if what we say is not true. Catalogue sent free to all intending purchasers. Write for it. Mention *The American Garden*. Address

F. R. PIERSON, Florist, Tarrytown, New-York.

BLUEBERRY PLANTS.

The Blueberry is a very profitable fruit to grow for market. It succeeds on high as well as low ground and is an enormous bearer; will yield 100 bushels per acre under ordinary cultivation and bears abundantly the first season after setting out; they are perfectly hardy, never known to winter-kill in this latitude. I am very anxious to have the Blueberry introduced in all parts of the country, and will send 1 dozen plants by mail for 60 cents; 2 dozen, \$1.00; 100 by express, \$2.50. Address

DELOS STAPLES, West Sebawa, Ionia Co. Mich.

You can easily secure one of these watches in a day or two or during your leisure time evenings. Address,
World M'g Co., 122 Nassau Street, New York.

\$25 LANTERN For \$12

The World Electro Radiant MAGIC LANTERN

The body of the Electro Radiant is a coneshaped reflector which gathers each divergent ray of light and concentrates them all on the mirror, whence the whole mass of brilliancy illuminates and projects the picture with startling clearness. No combination of lenses, however ingenious, has ever been known to produce equal effects with the light used. The cost of an outfit to enable you to do an profitable business is small compared with the amount of money it takes to do any other business. Any one of ordinary intelligence can operate it, and \$10 to \$50 per night may be earned by giving Parlor, Sunday School, Academy or Public entertainments. For Public Entertainments, the possessor of an Electro Radiant has something that will "draw" with the combined power of the Theatre, the Circus, the Prestidigitateur, the Country Fair, the Temperance Crusade, and the Comic Meeting. A room that will hold 100 persons may be filled nightly and a good profit be cleared. You have only to tack the sheet to the wall, darken the room, place the lantern on stand, light lamp, and you are ready to begin the exhibition. The Electro Radiant projects on the screen a Picture eight feet in diameter. \$10,000 were paid for the use of our Patent by Railroad Companies for Locomotive Headlights, it being considered the most wonderful light ever produced for the purpose. We have retained the exclusive right to make Magic Lanterns on the same principle, and the Electro Radiant is the result. The adjustment of Reflector, Lenses, Tubes, Slide, Rest and Cone are made with mathematical nicety. Optical laws governing such adjustments have been accurately calculated, so that you

PATENTED Perfection at the LOWEST PRICE

have in our Lanterns far more than appears, and we are placing within the reach of all, unsurpassed advances for Learning, Amusement and Profit. The transparent Slides for these Lanterns embrace views illustrating wonderful natural scenes from different parts of the world. The Scripture Subjects from both the old and new Testaments. Temperance—Showing the Gilly and misery of the Duikard. Art—Copies of famous Statues, Bas-reliefs, and Engravings. Miscellaneous—Such as Ships at Sea in a Storm, Steamboat Race, Fort Sumpter, Daylight Scene, Moonlight, etc. History—Landing of Columbus, Declaration of Independence, Yankee Doodle, etc. Comic—Slides without number. You can add to your assortment at any time. Lantern with slides complete, packed in neat box, may be easily carried in hand.—The Electro Radiant No. 2 (shown in cut) with slides and fittings complete will be sent by express on receipt of \$12.00 or C. O. D. \$13.00 is sent with order, purchaser paying the balance \$9.00 on express office. Full instructions and list of other views sent with each lantern. Send money order or registered letter, send all orders to

\$10 to \$50 easily made EVERY NIGHT. World Man'g Co. 122 Nassau Street, New York
We will give this splendid Lantern Free to any person who will send us an order for 20 New American Dictionaries. Send \$1.00 for a Dictionary and get up a club. Mention American Garden when you order.

R. termini, to secure Rapid shipments and prompt deliveries, are located at convenient points. Send for recent publications free of postage. Address **GEORGE W. KIRKE, GEN. SALES AGENT, 46 SOUTH ST., NEW YORK.**

SOME REPORTS ON THE MAPES MANURES.

Remarkable Crops of Potatoes, Cabbages, Strawberries, Onions, Sweet Corn, etc., Season 1883.

POTATOES.

W. F. ANDROSS, East Hartford, Conn., December 31st, writes:
 "Though the conditions of the past season, agriculturally speaking, were adverse, the potato crop, which in this section was grown almost exclusively upon 'the Mapes,' was a success in spite of the drought, which prevailed to a damaging extent. The acreage of potatoes in this vicinity was more than doubled, the reason for which is attributable, I think, to the fact that the Mapes Potato Manure has so invariably insured success that the farmers felt a confidence which has never been warranted by any other method of applying fertilizers. I used, as a trial, two other fertilizers especially recommended for potatoes—600 lbs. of one and 400 lbs. of the other; it is not necessary to speak of them further than that they both gave most unsatisfactory results. My experiments covered 14 varieties of potatoes, at all of which your formula had a chance, with good results throughout."

"A neighbor, Deacon Henry Holman, raised with the Mapes **173 Bushels** per acre of Early Rose; with Peruvian Guano, at much greater cost, only 430 bushels; and with * * * 'Hill and Drill' less than 300 bushels per acre at the same cost. Mr. Henry Lathrop raised a little over 300 bushels of Beauty of Hebron on a measured half acre with the Mapes, the condition of the land of course being good. This is the largest yield I have ever seen, and which I know to be a fact."

"There is one significant fact which may be considered: that of the hundreds who have used it here, not one but says it is the best."

POTATOES.

J. O. ADAMS, Island, Clinton County, Pa., Dec. 1st, 1883.
 Early Beauty and Late Beauty Potatoes:
 From Natural Soil..... 75 bushels.
 600 lbs. Mapes' Potato Manure, (400 lbs. broadcast, 200 lbs. in the hills)..... 270 "
 Quality not excelled by anything in the County. "Am satisfied that if they had not been struck by the blight I would have had at least 500 bushels."

CABBAGES.

Mr. ADAMS also reports: 800 lbs of the Mapes—10,000 cabbages per acre, good quality.

Send postal for descriptive pamphlet, containing reports from practical, well-known TRUCK, POTATO, FRUIT, AND SPECIAL CROP GROWERS; also prices, etc.

Freight Charges average 75 cents per 100 lbs., to points West. **GREAT LONDON TEA CO.,** 805 Washington Street, Boston.

"ACME" PULVERIZING HARROW, Clod Crusher, and Leveler.

AGENTS WANTED.
 It is the best selling tool on earth.

The "ACME" subjects the soil to the action of a Steel Crusher and Leveler, and to the Cutting, Lifting, Turning process of double gangs of CAST-STEEL COULTERS, the peculiar shape and arrangement of and thoroughly pulverizing the soil are performed at the same time. The entire absence of Spikes or Spring Teeth avoids pulling up rubbish. It is especially adapted to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that cuts over the entire surface of the ground.

We make a variety of Sizes working from 4 to 15 Feet Wide.
DO NOT BE DECEIVED. Don't let your dealer palm off a base imitation or some inferior tool on you under the assurance that it is something better, but **SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL.** We will send the double gang Acme to any responsible farmer in the United States on trial, and if it does not suit you may send it back, we paying return freight charges. We don't ask for pay until you have tried it on your own farm.

Send for Pamphlet containing Thousands of Testimonials, from 46 different States and Territories.

 Head-quarters for the **MONTCLAIR RASPBERRY.** Fine stock of **JAS. VICK, JERSEY QUEEN, MANCHESTER,** and other Strawberries. Send for Price List.
E. & J. C. WILLIAMS, Montclair, N. J.

The American Garden

A Monthly Journal of Practical Gardening.

DR. F. M. HEXAMER, Editor.

B. K. BLISS & SONS, Publishers.

Vol. V.

NEW-YORK, MARCH, 1884.

No. 3.

A MARCH DAY.

It seems but yesterday almost when the first snow-flakes were dropping among our bright, cheerful Chrysanthemums, reminding us in most forcible manner that summer and autumn with all their glory had departed. Higher and higher the snow heaped up in dale and field until all nature was laid at rest under the soft, sheltering down.

The gardens of many of our readers are still heavily covered with snow, yet under its warm mantle, ever-living, ever-active Nature is at work to prepare her floral children for the near spring, and the performance of their life duties.

But lo and behold! Here, on the south side of the sheltered shrubbery, piercing through the loaves, and close to the edge of snow and ice, are sweetly nodding the graceful silverbells of spring's harbinger—the Snowdrops. Crocus, Winter Aeonite, and many other early spring flowers are also showing the tips of their bright green leaves above the ground in the cosy nook.

While we stand gazing in admiration a dark cloud obstructs the sun; a few minutes later a heavy snow-squall beats rudely against our delicate pets, thus linking with snow-flakes the farewell of autumn's last flowers to the Snowdrops' first greeting in spring.

SOME SUGGESTIONS.

During the past month we have received more encouraging and appreciative letters from our readers than during any other similar period. As it would be impossible to answer all individually, we acknowledge their receipt in this general way, and assure our correspondents of the high esteem in which we hold their appreciation, kind wishes, and encouraging words.

Several of these letters contained interesting information about the gardening experiences of the writers, all of which shall receive due acknowledgment in future numbers. We were especially pleased to receive valuable advice from persons eminently qualified to judge about the requirements

and needs of horticultural publications. Some suggestions, however, it would be an utter impossibility to carry out, and others not without destroying what we consider the most intrinsic value and most important features of the paper.

A lady writes: "Why don't you give in your paper some information about household matters, and something to interest the children?"

To this, and to all advice about adding other departments to our journal, we have simply to say that THE AMERICAN GARDEN is strictly and exclusively a horticultural

not come in competition with other existing publications. There are none in our entire country which give as thorough and constant attention to every branch of practical gardening as THE AMERICAN GARDEN.

It has been our aim from the beginning to furnish our readers a paper, every volume of which should be a complete manual of horticulture, and every number a practical and reliable guide to their monthly garden work. That our endeavors have not been in vain, our rapidly increasing subscription lists bear unmistakable witness, and that most of our subscribers like their paper no one can doubt who reads their complimentary remarks, a very few of which only we have space to publish from time to time.

To do the greatest good to the largest number of our subscribers shall be our constant endeavor in the future as it has been in the past, and we shall always be glad to receive suggestions and plans toward this end, but do not ask us to devote our columns to fashions, cookery, puzzles, and stories.

ENCOURAGING WORDS.

THE AMERICAN GARDEN cannot be praised too highly.—J. I., *Niagara Falls, South Canada.*

With short, concise, practical articles, THE AMERICAN GARDEN is brimful every time.—M. M., *Youngstown, O.*

We like THE AMERICAN GARDEN better than any horticultural paper we have ever subscribed to.—E. H. L., *Orwell, Vt.*

THE AMERICAN GARDEN, with us, was "love at first sight," and the first number is well worth

the yearly price.—T. E. B. & S., *Grand Rapids, Mich.*

I get a dozen or two similar publications, but none suit me quite as well as THE AMERICAN GARDEN.—E. E. R., *Shiocton, Wis.*

The appearance of THE AMERICAN GARDEN has been greatly improved by the new cover, while its contents are just as good as ever.—G. S. W., *Rochester, N. Y.*

What I like about THE AMERICAN GARDEN is that it has a purpose, and is so clear-headed and systematic throughout—which cannot be said of many similar publications. Too much horticultural editing is slipshod.—S. D. P., *Norfolk Co., Mass.*

SNOWDROPS AND CHRYSANTHEMUMS.

paper, and as such it aims to stand second to none.

Without concentration and specialization, excellence is impossible in any field of literature, science, art, or industry of any kind. Should we divide our attention, broaden our platform, and scatter our work over larger fields we could not expect to excel in all departments. Then there are already many excellent publications entirely or largely devoted to the topics suggested by our correspondent. Why then increase their number? In general practical gardening, however, THE AMERICAN GARDEN occupies a field of its own and does

The Vegetable Garden.

SEASONABLE HINTS.

"Does it pay to make a hot-bed?" is a question which presents itself to many of our readers at this season. The answer to this depends largely upon what we expect as our pay. If the sole object is to raise a few hundred vegetable plants for transplanting to the open ground in a small family garden, these can probably be obtained easier and cheaper by buying them of those who make a business of raising plants.

To make a hot-bed pay, it requires also proper and frequent care, and where this cannot be given we would not attempt to make one. Without prompt and punctual attention to the opening and closing of the sashes, watering, weeding, and thinning out of the plants, a hot-bed can never be made a success; while, on the other hand, with proper care, such a structure can be made the most interesting and profitable part of the garden—profitable in more than money value only. The delight and satisfaction derived from the first bunch of Radishes or Lettuce raised in one's own hot-bed is infinitely greater than a bushel of bought vegetables can afford.

Frames, although easily and cheaply made by any one that can handle a saw and hammer, seem sometimes difficult to procure. In the English horticultural journals we find ready-made frames of various sizes and shapes advertised. These are so arranged that they can readily be taken apart, packed compactly together for shipment, and put up again by any one, in a few minutes. They are light and yet substantial, and are fastened together with hooks and staples. If our sash-makers would furnish something similar, adapted to the needs of amateurs, they would, no doubt, find large sales.

Potatoes in Pots. The usual way of forwarding Potatoes earlier than those planted directly in the open ground consists in starting the sets in a hot-bed or in shallow boxes in a warm room, and transferring the plants to the open ground as soon as the season permits. The principal difficulty in this case is that, in transplanting, frequently a good portion of the roots become lacerated, and the young plants wilt and suffer in consequence. To avoid this we planted last year a number of single eyes in three-inch pots and placed them in a moderate hot-bed. They grew so rapidly that they had to be shifted into larger pots before the ground was in proper condition to receive them, and when finally set out, they had already formed a good many young Potatoes. They grow vigorously without a sign of wilting and matured fully a month before the earliest ones planted directly outdoors. This plan is, of course, not feasible on a large scale, but for one's own use it is quite satisfactory, and well worth the trouble of raising a few hills.

The Farm Garden is too frequently neglected until all the field crops are planted, or at best receives only a little superficial attention at odd moments. This should not be so. The garden is entitled to the first and principal care, for it is here that sustenance is raised for the most valuable the farm contains,—the farmer and his family,—against the price of which the value of the entire farm is but a grain of sand.

ECONOMICAL MANAGEMENT OF HOT-BEDS.

For the raising of plants to set out in an ordinary family garden, two hot-bed sashes of the usual size, six feet by three, will be sufficient. One of those should be started at first; the proper time for this varies, of course, according to seasons and latitudes. In a climate where Early Cabbage may be set out by the middle of April, the hot-bed should be ready to receive the seed by the 7th of March.

Six boxes or trays, four inches deep, should be provided of such size as will completely fill the bed. In one of those boxes plant Lettuce, two varieties, and in another Lettuce. Those should be sowed quite thinly, as they will not be transplanted until put outdoors. In another box sow Early Cabbages, Early Cauliflower, and two varieties of Tomatoes,—sowing the latter across the box, with the Cabbage or Cauliflower at either end. Place this box across the middle of the hot-bed, and the Beets and Lettuce on either side. A fourth box may be sown with the hardier flowering annuals, like Phlox Drummondii, Verbena, etc.

If the heat is sufficient, the Cabbages and Cauliflowers will be ready to transplant in from two to three weeks, and should be pricked into the two vacant boxes. The Tomatoes may be transplanted into the same box in which they grew, placing the plants three inches apart. This will give forty-eight plants to each box, which is a sufficient number of plants for a family garden.

About two weeks later, it will be necessary to harden off all plants except the Tomatoes and the flowers. The other sash should be brought in readiness by this time, and the two boxes containing Tomatoes and flowers transferred to this. The space left vacant in the first hot-bed may be covered with Potatoes cut in halves, laid cut-side down, and covered with four inches of rich earth. By the time frosty nights are nearly over, these Potatoes will have formed bushy plants, five or six inches high, with little tubers at the bottom as large as Peas. These plants, if carefully transplanted in a warm soil, will be two weeks earlier than those from sets planted in the open air. When the Cabbages, Cauliflowers, Beets and Lettuce are transplanted to the garden, the space made vacant can be used for starting Sweet Potatoes, Dahlias, Cannas, etc., or a couple of hills of Cucumbers may be planted.

The unoccupied part of the new bed may be utilized by starting Lima Beans, Squashes, Water and Musk Melons, Egg Plants, and Cucumbers, in three-inch flower pots. By hilling these with rich compost, and planting two seeds in each pot, a gain of two or three weeks can be secured, which in backward seasons and northern localities will often make all the difference between a crop and a failure.

A spent hot-bed may be devoted to a number of uses besides growing mammoth weeds. A hill of Water-melons or winter Squashes will thrive wonderfully, planted in the center of a hot-bed, and the little offshoots which are found on the side of Tuberoso bulbs, if planted in a spent hot-bed about June 1st and protected by the sash in September and early October, will often so increase in size as to bloom the following season.

L. B. PIERCE.

DRILL OR HAND SEEDING.

To the gardener who has never given it a trial it would be a surprise to see how much even and straighter seed can be sown with a good seed-drill than by hand. Seed-drills effect not only a saving of seed in sowing, but also of time in doing the work, and more than all in the time necessary for cultivation. They really produce better crops because they sow the seed more evenly in a straight row, and in a much narrower line than can possibly be done by hand. Less seed is required to sow the same distances, and by sowing regularly all the space is occupied, and if the seed is of good quality there is no necessity of there being vacant spots in the row.

Every gardener, and especially a beginner, knows how difficult it is to take fine seeds between the fingers and sow them evenly along the row. You are very apt to sow some places very thick, other spots thin, and skip some places entirely, while you will probably scatter the seeds—that is, instead of placing them in a narrow line, as is desirable, they will be scattered in a row two inches or so wide; this is especially the case with the lighter seeds. The uniform depth that a seed-drill covers the seeds is also an important point to be considered, as it is almost as much of a task to cover seeds to an even depth as it is to sow them.

Most of the seed-drills now manufactured are adapted not only for sowing and covering the seed, but are also of great value for cultivating the plants after they make their appearance above ground.

N. J. SHEPHERD.

EARLY CABBAGE.

When well grown and kept free from its enemies, Early Cabbage is a paying crop. To be sure of success, the soil should be made very rich; in fact, there is no use of planting Early Cabbage without heavy manuring. Some growers sow their seed in the fall, and winter the plants over; but I prefer sowing in February or March, and usually have plants just as early and better than if wintered over. If they are attacked by the flea, ashes or soot are sifted on them.

The land is prepared for planting by hauling and spreading all the manure on the ground I can spare, breaking the ground deep and thoroughly pulverizing it. I have never regretted working the soil too much. As soon as ready for planting, the ground is marked off in rows three feet apart. Some good fertilizers are used in the hills, which are about fifteen inches apart in the rows, and the plants set out. When I can conveniently commence to mark the ground, after four o'clock, and set the plants the same evening, I prefer to do so, as the roots will strike in the fresh soil quicker and the plants do not wilt.

I cultivate and hoe my Cabbage every few days, sometimes until they are nearly ready for market. When insects molest them, I apply a sprinkling of soot, if to be had; otherwise, ashes are used. The best remedy against the Cabbage worm is to induce quick growth, and if the plants are set out early, they will be more likely to come through unmolested than if planting is deferred till the season is more advanced.

To any progressive gardener, a seed-drill is an indispensable implement.

THOS. D. BAIRD.

AMERICAN PEAS.

There was a time, and that quite recently, when the thought of producing here new and valuable varieties of Peas would have been considered visionary. Yet as every year almost destroys some delusions about various products which it had formerly been considered impossible to raise or manufacture on our continent, so has the preconceived idea that good Peas could come from Europe only, been indisputably disproved by subsequent events.

Several American varieties, especially those originated by that distinguished horticulturist, the late Mr. Charles Arnold, and described below, have been found not only best adapted to our climate, but are rapidly superseding many of the older kinds hitherto held in high repute in other countries.

AMERICAN WONDER.

With the exception of the Early Rose Potato, perhaps, no vegetable of American origin has ever become so widely and favorably known throughout the civilized world, as this Pea. Its remarkable dwarf habit, its earliness, productiveness, and excellent quality have introduced it into every garden of any pretension whatever; and as the pioneer of a new and distinct class of American Peas, it will always retain a renowned and permanent place in the history of horticulture. It is already everywhere so well known as not to require description here. It was produced by crossing Little Gem with Champion of England, and together with the two following varieties, raised simultaneously from the same parentage, was early selected by Mr. Arnold as one of the most valuable of the many thousand seedlings originated by him.

BLISS'S ABUNDANCE.

Season medium early. Plant half dwarf, fifteen to eighteen inches high; foliage large, thick, full, and dark green. Pods three to three and a half inches long, roundish and well filled, containing six to eight large wrinkled Peas of excellent quality. Sown at the same time as American Wonder or other very early kinds, it will just come into bearing when the first has ceased. This, as all the varieties of this strain, has a remarkable tendency for branching immediately above the main root. Its productiveness is simply enormous, and—not to make what might otherwise seem an exaggerated statement—we give herewith a photographic illustration of a single plant which bore seventy-five pods, but as many as one hundred pods have been produced on a single plant.

BLISS'S EVERBEARING.

This comes into bearing shortly before the preceding is drying off, and about a month after the earliest kinds. It grows eighteen inches to two feet in height; foliage very large, firm, and bright green; pods three to

four inches long, each pod producing six to eight wrinkled Peas of extraordinary size, many of them half an inch and over in diameter. In general quality, flavor, and marrowy richness it is not surpassed by any Pea we are acquainted with.

In this variety the peculiar branching habit is still more developed, and it is not rare to see eight or ten strong branches growing to full height, all from one root-stalk. Each

Copyright, 1883, by B. K. BLISS & SONS.
BLISS'S ABUNDANCE PEA.

one of these will, under favorable conditions, bear nearly as much as an entire plant of some of the older kinds; it is therefore evident that the yield of the individual plant is almost wonderful. But of still greater value than its immense productiveness is its remarkably prolonged and continuous bearing season. We have for many years experimented with all the leading old and new

BLISS'S EVERBEARING PEA.

varieties, but have never found one that could equal it in this respect. For late summer and autumn use when green Peas are generally scarce and in demand, it will therefore be a most desirable acquisition.

These three varieties, *Abundance* and *Everbearing* especially, being characterized by their peculiar habit of growth, require a some-

what special treatment,—without which they will not, and can not develop their best qualities. No one would, of course, expect maximum crops on poor, shallow, and negligently tilled soil, yet even this would not prove as detrimental as planting the seed too thick. The principal conditions for obtaining best results with these Peas may be summed up as follows:

1. The individual plants *must* have sufficient room for expansion. We had them six inches apart in the rows last season, and, when full grown, found them far too much crowded, so that this year we intend to experiment with some planted a foot apart.

2. Peas planted after the ground has become dry and warm *must* be covered deep, four to six inches at least. This insures immunity against drought and produces stocky plants.

3. The pods *must* be picked clean at every picking. It is ruinous to the vigor and productiveness of the vines to leave those pods on that are too old for use, or to try to raise seed at the same time. The oftener and

the cleaner Peas are picked the greater will be the yield. Seed Peas should be raised in separate rows for that purpose only.

RAPID TRANSIT FOR SOUTHERN PRODUCTS.

The *Market Journal* states that the Pennsylvania Railroad Company has projected, and will put in operation next summer, one of the most extensive schemes of its kind ever known in this country. It is the establishment of a fast, direct line for the transportation of vegetables from the South to Northern markets. The speed of the trains will not be less than twenty-eight miles per hour; and vegetables picked on the truck farms in the vicinity of Norfolk one afternoon will be landed in New York and ready for sale the next morning. Strawberries picked at Savannah, Georgia, one afternoon will be exposed for sale in this city the second morning thereafter. It is intended to put on fast lines between Chenystone and the principal Western cities, and, in this way, place Southern produce there at least three days in advance of the present time of delivery.

DRYING TOMATOES.

It is stated that in Italy the pulp of Tomatoes is dried by pressing the fruit through bags, so as to free it from seeds and skins, and then spreading it on boards and exposing it to the sun. Some of our improved fruit-drying apparatuses could, no doubt, be used to good advantage for this purpose; and as the dried pulp is as serviceable for soups, stews, etc., as the fresh fruit, this mode of preserving this excellent vegetable is well worth the attention of Tomato growers.

The Fruit Garden.

SEASONABLE HINTS.

Every year brings its new varieties of fruits claiming superiority over the elder kinds, and in the localities where they originated some of these do sometimes present advantages over others, but when put to test in different soils and climates the greater proportion fail entirely. Yet in the progress of fruit culture some varieties in each class have been originated and established which adapt themselves in a remarkable degree to varying and widely differing conditions. The number of these is already considerable, and their general character is so well understood that, while a few years ago almost every fruit-grower considered his special list the best, there is now a remarkable uniformity among the lists recommended for general cultivation.

Fruit Lists.—We have before us half a dozen lists recommended by as many prominent fruit-growers and nurserymen; among them, P. M. Augur, Chas. A. Green, Hale Brothers, J. T. Lovett and others. Their choice of varieties best suited for general cultivation is so astonishingly alike, as well as nearly corresponding with our own experience, that the average of all, as given below, does not differ much from any of the individual lists.

Strawberries.—Charles Downing, Crescent, Cumberland Triumph, Kentucky. For additional varieties, Sharpless, Manchester, James Vick, Mount Vernon. The chief requisites with whatever list is chosen are rich soil, clean culture, and frequent renewal.

Red Raspberries.—Turner, Hansell, Cuthbert. Additional: Montclair, Reliance, Superb.

Black Caps.—Souhegan, Mammoth Cluster, Gregg. For canning: Shaffer's Colossal.

Yellow Raspberries.—Caroline, Brinckle's Orange.

Currants.—Fay's Prolific, red; White Grape, white; Lee's Prolific, black.

Gooseberries.—Downing, Smith, Houghton.

Blackberries.—Early Harvest, Kittatinny, Taylor.

Grapes.—The following list, recommended by the New Jersey Horticultural Society, cannot be bettered:

Worden, Concord, black; Brighton, Jefferson, red; Pocklington, Duchess, white.

The following list of tree fruits is given by Mr. P. M. Augur, State Pomologist of Connecticut:

Peaches.—Early Rivers, Mountain Rose, Oldmixon, Stump the World; for white flesh, Ward's Late and Reeve's Favorite; for yellow flesh, Crawford's Early, and Late, Smock.

Apples.—Early Harvest, Fall Pippin, Gravenstein, Fameuse, Hubbardston, Rhode Island Greening, Baldwin.

Pears.—Doyenne d'été, Bourro Giffard, Clapp's Favorite, Bartlett, Sheldon, Onondaga, Beurre Bose, Beurre d'Anjou, Lawrence, Dana's Hovey, Josephine de Malino.

Cherries.—Early Richmond, Black Tartarian, Reckport Bigarreau.

Quinces.—Orange, Pear, Champion.

This list, although not comprising all the varieties of highest quality, cannot fail to give satisfaction over a larger area than any other that could be named.

GRAFTING GRAPEVINES.

Grafting more delicate or better varieties of Grapes upon hardier or inferior stock is at present extensively practiced in our vineyards, and still more in the phylloxera-stricken regions of Europe. The results so far have been highly satisfactory, and the finest Grapes sent to New-York market last season were from grafted vines. Any person accustomed to graft Apples can also succeed with the Grape. The main points in the operation are:

Time.—From the fall of the leaf till the rising of active circulation of sap in spring, and again after the exceedingly strong active flow of sap—say from the development of the third leaf on the young shoot—till the time of bloom. The earlier period is generally considered the best; sometimes, however, in what is called an early spring, no opportunity is given to avail oneself of it.

The Cions should come from healthy, short-jointed canes of last summer's growth, those of the size of an ordinary lead pencil, or little larger, preferred. They are best cut in the fall, and buried in the ground to keep over winter, though good success may be had with spring-cut cions.

How to Graft.—When the stock (that is, the root in the ground) is over half an inch in diameter, the ordinary "Cleft Graft" is best. Remove the soil from around the vine to the depth of three or four inches. Select a spot with smooth bark, on which the wrapping shall be made, and with a fine saw cut the vine off horizontally. Then proceed as in cleft grafting of Apple-trees, inserting two cions, each having two eyes, the lower one being on a plane with the top of the stock. Now wrap tightly the stock with some strong twine, covering with grafting clay, composed of one part fresh cow-dung and four parts of ordinary tenacious clay. The tallow and rosin contained in ordinary grafting wax seem to exert an injurious influence on the Grape. Replace the earth around the graft, so that the upper bud of the cion will be level with the soil. Shade or lightly mulch the surface of the ground.

In cases where the stock and cion are nearly of the same size, the so-called "whip graft" is most advantageously used, proceeding in the same manner as in that of the cleft graft after fitting the stock and cion together.

Break off all shoots, starting from the stock, in order not to rob the cion of sap. The buds of the cion frequently remain dormant till the last of June or middle of July.

In northern climates, winter protection of the grafted vines by laying them down is advisable, and prudence would suggest pruning back to a few eyes the first fall, as the union between the stock and cion might be severed in the attempt to layer the entire vine.

J. B. ROGERS.

PLANTING TREES.

A very large share of our fruit trees are planted in the spring, and many orchardists consider this season better for the work than fall. A summer's growth, if not rank and forced, enables the young trees to better withstand the cold, hard winter. But while we are planting in the spring, we should bear in mind that there are dangers to be guarded against during the summer, as well

as the winter. In fact, I think that there are fully as many young trees lost through mismanagement and lack of care during the first spring and summer as are destroyed by severe winters.

The first mistake is usually made when setting the trees in the ground, and even many a careful, painstaking person commits a fatal error frequently in his efforts to do the work thoroughly and well. He reasons that the roots must be set well down in the ground in order to protect them against a possible drought, or even an ordinary amount of dry, hot weather. So he digs a deep hole, and puts a nice little bed of compost at the bottom, for the roots to rest in and feed on. The tree is probably set six inches lower in the ground than it stood in the nursery. All that separates the roots from the cold, hard subsoil is the little filling of muck or compost that has been put in. If the roots are not drowned out at once, they feed rapaciously upon this small but stimulating amount of non-nutrition for the first year, causing a rank growth of tender shoots that are ill-fitted to cope with our hard northern winters. But this is not the worst: the roots soon exhaust this fertilizing material, and of course receive a decided check when they endeavor to pierce the surrounding hard-pan. The heavy top cannot be sustained, and it is almost sure to succumb to the drying winds or the frost and sun.

Another danger resulting from this practice is that unless the soil is thoroughly under-drained, water will settle in these holes, and the young trees will be water-killed within a few months after setting out. Many porous soils have a good natural drainage down to the hard-pan, and trees, set moderately shallow, would suffer very little from the effects of water if the ground were not under-drained. But when the trees are set below this porous surface soil into the hard-pan, they are virtually below water-line, and their destruction is only a question of time.

I am most emphatically in favor of shallow planting. The only objections that I have heard made against this method are that the tree stands less firmly, and that the roots are more liable to dry out during the dry, hot weather of summer. To the first objection I would say that it is a very easy matter to brace the trees, and that they ought to be braced in any case. And, as to the second objection, it is really an argument in favor of shallow planting, for the planter is then obliged to mulch his trees in order to keep them from drying out, and thorough mulching is the only safeguard for young trees. It must be kept up continuously, summer and winter.

Set trees shallow, and protect their roots until they have had time to establish themselves in a manner natural to their new surroundings, and comparatively few trees will be lost when the other conditions are all favorable.

W. D. BOYNTON.

THE CRANBERRY CROP.

Mr. N. R. French, statistician of the American Cranberry Growers' Association, reported at the recent annual meeting that the crop last year was, in New England, 155,000 bushels; New Jersey, 125,000; Western States, 145,000—a total of 425,000, against 322,000 in 1882, and 461,000 in 1881. Good prices have prevailed.

CHEERRIES FOR SUCCESSION.

Ripening after Strawberries, Cherrios are valuable for home use and market. The Bigarreau and sweet kinds are vigorous growers and very productive—the former have firm flesh, and are not so juicy and rich as the latter, but being large and showy command a good price; but unless the weather is favorable when nearly ripe the fruit is apt to crack and rot. The Duke and Morello varieties are much less liable to injury by the weather, and are more profitable for market, and especially so for all culinary uses. The following give a succession of fruit in the order named for nearly two months: *Empress Eugenie, Knight's Early Black, Mayduke, Coe's Transparent, Black Tartarian, Governor Wood, Early Richmond, Napoleon Bigarreau, Monstrous de Mezel, Montmoreney Ordinaire, Downer's Late, Reine Hortense, Love Apple or Tomato Shape, Louis Philip.*—Charles Downing, in *N. Y. Tribune.*

RUSSIAN APPLES.

In the year 1870 the Agricultural Department at Washington received from *Dr. Regel*, the director of the imperial botanic gardens at St. Petersburg, cions of two hundred and fifty-two different kinds of Russian Apples. All grew, and cions of them were extensively distributed—one hundred thousand having been sent out in one year.

Mr. Charles Gibb, of Abbotsford, Quebec, to whose valuable work in studying and introducing fruits adapted to northern climates we had occasion to refer previously, is now engaged in sifting their discouragingly confused nomenclature, and in determining the varieties of most value. Thus far he has selected and described ninety-three kinds, and requests all who have tested these fruits to send notes to the horticultural societies of their respective states, and thus tend to bring facts to a focus of the important question.

THE PEACH YELLOWS.

WHAT SHALL WE DO ABOUT IT?

It matters little to Peach growers whether the yellows be caused by fungi, bacteria, Peach aphid, or whatever other cause, so long as we fail to escape, manage or control it. Like the Potato fungus, it often first shows itself in a single spot,—perhaps a single branch of a mature tree, and in course of time, the entire orchard is involved in ruin. But shall we abandon growing the Peach? By no means. While the yellows in the Peach, Pear blight, the eucullie, Cranberry worm and the Apple worm, are to be regarded as public calamities, yet there are compensations in better prices for the perfect fruit. Therefore, wisdom dictates to overcome these difficulties, and insure consequent reward. Our conclusions are:

1. Avoid any diseased or contaminated stock in propagation, either by seed or bud, as promptly as we would avoid the virus of scarlet fever or small-pox.
2. Seek an orchard location apart from all contaminating influences.

3. Fertilize judiciously, either by well-fined stable manure, or special chemical fertilizers adapted to the nature and wants of the Peach.

4. Lest the land should contain acidity prejudicial to healthy growth, apply occasionally twenty bushels of lime, more or less, in direct proportion to humus in the soil, to sweeten and fine the soil.

5. Secure uniform cultivation and fruitage; avoid over bearing, and also an excessive late autumn growth, also keeping trees free from the Peach-borer.

But is there any specific cure for the yellows? We hardly dare say yes, and we will not say no. *Dr. Goessmann* and *Prof. Penhallow* have made analyses and microscopic examinations, and have advised the use of high grade muriate of potash, kieserite, and other ingredients suited to the general wants of the tree. Peach growers of the Hudson River district are using *Penhallow's* formula with considerable confidence. If a tree be slightly affected we would advise a heavy shortening back of the branches, and a full ration of the fertilizer advised by

HOW TO KEEP WINES.

Wine to keep well, and retain or improve its original flavor and taste, must, of course, be of good quality to begin with, but the importance of proper storage is frequently left out of sight in the family wine-cellar. The following remarks of *Mr. A. Haraszthy*, before the California State Viticultural Commissioners, give some valuable information on this subject:

"All wines should be stored in a fixed, moderate temperature, so as to prevent as much as possible a too sudden or oft-repeated expansion or contraction, either of which is detrimental to its quality. A given heat causes expansion and a renewal of fermentation; extreme cold causes contraction and neutralizes the flavor. European light wines keep best in cellars where the temperature lies between 50 and 55 degrees, while California light wines do better in a temperature varying from 65 to 70 degrees, and especially suffer when the temperature goes under 55 degrees.

"Champagne wines require the most care in keeping. They should be maintained in a temperature under 60 degrees, and the bottles should be carefully kept lying on their sides. They should never be placed on their bottoms, as from this cause they would speedily lose all their sparkle—for, standing up, the corks shrivel, dry up, and allow the carbonic acid to escape between the contracted cork and the sides of the neck of the bottle. When once stored away they should not be touched, except for removal to the table, and if they are left in the cases the mark on the upper side should be carefully attended to. This mark indicates which side of the case should be kept uppermost.

"Many persons are surprised at the appearance of some kind of deposits in wine which has put on a novel appearance, and attribute it to substances wholly foreign—either adulteration or accidental. Such is not the case. The precipitation of wine in the bottle is only the continuance of that which began in the vat, and keeping this in mind, the remedy is apparent. All wines deposit in this their last state of fermentation the coarse crust of Pert, or the white, sandy

deposit of Champagne, or the almost invisible sediment in nearly all other wines. But your wine, though a little faulty in appearance, is none the worse in quality—quite the contrary. These deposits are *prima facie* evidence of age within the bottle; hence an acquired mellowness and a development of its ethereal characteristics. Do not complain, therefore, when you find your wine has thrown down a slight sediment; the wine is better for it, and you can easily decant the clear wine.

"The different soils on which the vines grow and the nature of the season will sometimes cause a difference in the appearance of the crystals and other deposits. Sometimes it will adhere to the sides of the glass when poured out of the bottle; at others it will become suspended in the wine, having too much lightness to sink, and remain in suspension while the wine is acquiring its age."

EARLY RICHMOND CHERRY.

Prof. Penhallow, hoping for its restoration. We regard muriate of potash, sulphate of ammonia, kieserite, and superphosphate in suitable proportions, as most nearly meeting the demands of a diseased Peach-tree.

Our experience leads us to believe that most of the failures in Peach growing are preventable. That the uniform course of clean culture till midsummer only is important. That we should prune and shorten so as to secure a proper renewal of young wood each year. That we should so manure or fertilize as to meet the demands of each year, as to growth and fruitage, increasing with the age of the tree. That we should take no other crop from the orchard after the trees commence bearing, and not allow trees to overbear.—*P. M. Augur*, before the Connecticut State Board of Agriculture.

The Flower Garden.

PANSY SHOW.

Three children sat in a row on a fence;
They know not what to do;
They were tired of playing their old games,
And wished for something new.

They looked around with discontent,
"Till they saw the Pansy bed,
Where each bright blossom, in purple and gold,
Was nodding its royal head.

Then one of the children cried aloud:
"Let's have a Pansy show;
We can dress the flowers and make them look
Just like people, you know."

They gathered the velvet Pansies,
And whom dressed in green and white,
They were placed in groups on the grass—
It was truly a fairy sight.

They charged five pence admission
To see the wonderful flowers,
In this way they made great profits
And spent many pleasant hours.

In summer you will see the Pansies,
On their faces an eager glow,
Waiting to be picked by the children,
And placed in the flower show.

—Young People.

SEASONABLE HINTS.

Tender Plants to be raised from seed should be started during this month, in a hot-bed or in pots in a warm, sunny room. For although many tender annuals will bloom when sown outdoors in May, they will rarely come to fullest perfection unless started previously, as they require a longer season than our summers afford. A frequent cause of failure with plants raised in this way is sowing too thick, and the neglect of thinning them out sufficiently. Whenever practicable, young seedlings of all tender plants should be pricked out before their final transplanting, allowing liberal room to each plant. Half a dozen stocky, evenly developed plants are worth more than hundreds of puny and sickly ones.

Roses deteriorate generally by being left too long in the same soil. When a Rose-bush has been growing three or four years in the same place, it should be transplanted, or a part of it at least. Liberal manuring will, of course, be of some benefit,—and Roses will bear almost any quantity of manure,—but it cannot entirely take the place of transplanting to new soil.

Half-hardy Roses suffer often more in spring than during winter, just when the sap begins to start. Bushes that are not already protected should therefore have a little straw thrown over them to retard their growth, as well as to prevent their becoming sunburned.

Bulb Beds should have a part of their covering removed at the earliest opening of spring, and the remainder slightly loosened. But all should not be taken off the first warm day, else the young, tender shoots which have been pushing forth under the covering are likely to become injured by night frosts.

Hardening Plants, wintered in frames or in the house, and intended for bedding out, is of great importance at this season. Unless it is actually freezing, plenty of air should be given on all bright days. If forced now, plants cannot make a thrifty and healthy growth during summer.

GROWING PANSIES.

The beautiful plate which we present to our subscribers this month will serve to illustrate the wonderful improvements which have been made in these flowers since the days when the modest Heart's-ease growing in grandmother's garden was their highest type. The individual flowers, as portrayed on our plate, although as life-like as art and pigments can make them, fall still considerably short of the marvelous beauty of their originals.

IRIS GERMANICA.

Can I grow as beautiful flowers as these? will be the natural query of the beholder. "Yes," we answer unhesitatingly, if you really love flowers and take pleasure and delight in administering to their wants. The first condition for growing beautiful Pansies is first-class seed; for, although not every seed, even of the very best selections, will produce as fine flowers as their parents, the

IRIS SUSIANA.

proportion of first-class ones is by far greater in the choicer strains.

For winter and early spring blooming, the seed is sown in August, outdoors, in well-prepared beds, and for summer blooming, in February or March in pots or boxes in a warm room or in a hot-bed. It should be scattered very thinly on light, rich soil, covered about one-eighth of an inch, pressed down lightly and kept moderately moist.

The soil should be shaded from the direct rays of the sun until the seed germinates and the young plants appear above ground, which will be in from ten to twelve days. As soon as large enough to handle, the seedlings have to be pricked out about two inches apart in light, rich ground, and finally transplanted outdoors ten to twelve inches apart each way.

Pansies thrive in any rich and deep soil. A compost much in favor with specialists is prepared of one part of good loamy garden soil, one part leaf-mold, and one part well-decayed cow manure. They delight in a somewhat shady position, and plenty of moisture in dry weather, with the addition of a weekly dose of liquid manure. The more flowers are cut off the more new ones will develop, and the faded ones must be scrupulously cut off every day; this is an absolute necessity when long-continued bloom is desired.

THE IRIS.

The Iris is a lovely border flower. It has a delicacy of texture unequalled by any other. Hold one up between you and the sun and it seems so fragile that you half expect to see it melt away, for its petals look as if wrought of frost, colored by some of Nature's chemicals. It ranges through many colors and shades of colors, from subdued to the most brilliant. The common varieties are a pale lavender, which is almost white, a delicate straw color, and a most intense, velvety purple. A group made up of all these colors is exquisite. It will look as if covered with gorgeous butterflies. The Iris resembles Orchids in its delicacy and brightness more than any other flower.

It is a robust, hardy plant, increasing in size and beauty year after year, when given a deep, rich soil to grow in. For use in vases, for the house, it is simply superb. The flowers remain in perfection for days after being cut.

When ordering plants for spring planting, do not forget a collection of Iris.

R. E. E.

NEW MARIGOLDS.

With the introduction of the strikingly beautiful Marigold, "Meteor," attention has been drawn to the merits and possibilities of this genus. Every year brings some new varieties, and the following, introduced from Europe, among the novelties of the season, appear to possess superior merits:

Calendula maritima, fl. pl.—The original form is a native of the Sicilian Mountains, and is dwarf, compact, and free-blooming, and cultivated as a valuable spring flower. This new double form is claimed to be superior in many respects to *C. officinalis*. Its flowers are somewhat smaller, but are so abundant that they cover the plants for two to three months, and though perennial, it is said to commence flowering two months after being sown.

C. Sicula, fl. pl.—This differs from the foregoing chiefly in the color of its flowers, which are of a brilliant orange. It is of the same bushy habit, and flowers abundantly.

C. officinalis, "Prince of Orange."—A seedling of "Meteor," which it resembles in form and general habit, but is said to far surpass it in brilliancy of coloring, especially in the intense shade of its orange stripes.

W. BLISS'S PERFECTION

DOUBLE BUTTERCUPS.

In the modern rage for flaming, glaring, bedding plants, some of the prettiest and most attractive, though modest, flowers of the garden border of former days have become almost entirely forgotten until some admirer of real beauty resurrects them from oblivion. Among these are the Double Buttercups, more frequently known as "Bachelor's Buttons," or "Fair Maids of France," the chaste beauty of which is excelled by but few hardy perennials blooming in early summer. Their flowers are produced in greatest abundance, and as they keep a long time after being cut, they are particularly desirable for vases and bouquets.

There are many species and varieties cultivated. The most desirable ones, shown in our illustration, for which we are indebted to *Gardening Illustrated*, are:

Ranunculus bulbosus fl. pl.—This has very large, yellow flowers as double as Pæony Aster. Sometimes the petals are slightly tipped with green, and two or three blossoms rise one above the other.

R. acris fl. pl. bears a great abundance of many-flowered heads of yellow, button-shaped flowers, blossoming for many weeks in succession, and if cut frequently, a continuous bloom may be had all summer.

R. repens fl. pl., its compact variety, is of neat growth, and bears a profusion of bright yellow, compact, rosette-like flowers of most perfect form.

R. aconitifolius fl. pl., with its delicate, chaste, white flowers and graceful habit, is a most beautiful plant, worthy of a place in the choicest flower border, even if it is nothing but the "White Maids of Kent," and old-fashioned.

Buttercups will grow in any soil not too light, and rather moist; but to develop to their best advantage, they require a deep, loamy soil, liberally enriched with well-decayed manure. They are increased by division of the root-stalks, planted early in spring, and should be lightly mulched during the hottest part of summer.

HARDY PERENNIALS FROM SEED.

In addition to our window and greenhouse plants set out for the season, Marigolds, Drummond Phlox, Zinnias, Stocks, Asters, Petunias, and other showy annuals contribute largely to the display of our summer gardens; but, to people of moderate means or convenience, hardy perennials must be the mainstay. The easiest way in which to get up a generous stock of these is from seed. Some species, as Columbines, perennial Pinks, evergreen Candytuft, Thrift, and Gypsophila, germinate readily, and are as easily raised as most annuals in fall or spring; others, as perennial Asters, Phloxes, Gentians, Shooting Star, do not come up

readily, and seldom in a full crop, but different species differ in time of coming up. For instance, I have raised as full a crop of Aster Curtisi in a month as I would of Drummond Phlox; whereas I could only get up half a crop of *A. lavis* in six months. The Crowfoot family of plants—for instance, Anemones and Clematises—come up irregularly, that is, a few at a time, for weeks, maybe months; and even Columbines appear in the same way, though more in a crop. Members of the Pea family often come in the same way; for example, Thermopsis, Astragalus, and Orobus.

American plants, more than those of the Old World, seem harder to raise from seeds. Of course, with care, patience, attention,

in winter, to prevent the soil being "thrown out" by frost. Being in the earth over winter greatly assists the germination of the seeds of hardy perennial plants; and most noticeable is this in the case of bulbous plants and some trees and shrubs. And in this way I have secured a full crop at one time in spring, when from seeds of the same gathering, sown in the greenhouse in spring, I got an irregular and seldom full crop.

But, as it is spring-time now, we will consider what is best to do in this case. Sow the seeds in the way you would seeds of annuals, but in most instances be prepared to wait longer for them to germinate. If they come up thickly, thin or prick out soon. Do not let them suffer for want of water, nor burn up by warm sunshine, so long as you can place a piece of mosquito netting, newspaper, or branch over them by day to shade them a little. Coax them along by keeping them clean and cultivated, and when big enough transplant to permanent quarters.

If you have some old plants of herbaceous Veronias, Loosestrife, Belleworts, and the like, that need dividing, I should advise you increase them by division rather than by seeds; and clumps of Anemone Japonica, Senecio Puleher, Ocnotheras Speciosa, and others with thick, fleshy, wandering roots, by pieces of the roots. Particular varieties, as of Larkspur, Pæony, or Rose Feverfew, are not always likely to be perpetuated true from seed; but natural varieties, as the white-blooming form of Erius, are perfectly constant.

As this article has already grown longer than I anticipated, I shall defer a list of the most desirable ornamental perennials till next month
WM. FALCONER.

GROUP OF DOUBLE BUTTERCUPS.

and proper convenience, they can be raised; but without such they are troublesome. Take Twinleaf, Lungwort, Bowman's Root, and Blood Root under garden care, how hard it is to raise them; but let them drop their seeds and keep the ground clean, but do not hoe or spade it, and the next spring seedlings appear all around.

When practicable, the best time to sow perennials is in late summer or fall, as soon after you have secured good ripe seed as possible. If, like Larkspurs or Thrift, they are of kinds that will come up some days after being sown, you may sow them anywhere, and afterward thin out or transplant the seedlings; but, if of kinds not likely to vegetate before spring, it is a good plan to sow the seeds in boxes or pots, which plunge in a cold frame or in a sheltered place in the garden, with some leaves over the boxes

and yet they are but little known to our cultivators generally. The little wild Wood Anemone, *A. nemorosa*, with its cheerful white blossoms in early spring, is quite readily grown in partial shade. *A. sylvestris*, the Snowdrop Anemone, is one of the finest hardy border plants of which I have any knowledge. The Japan Anemone, *A. vitifolia*, is not thoroughly hardy, and should have a light covering during winter. The bright purple flowers of the *A. Pulsatilla* will cause it to be a favorite with every gardener who makes its acquaintance. Attention is thus called to a few out of the many beautiful species belonging to this genus, with a hope that the time is rapidly approaching when more notice will be accorded not only to this but to other genera that are worthy of a place in the smallest collection.—[Josiah Hoopes, in *N. Y. Tribune*.

THE WIND-FLOWERS.

The Anemone genus embraces some of the most beautiful and easily raised flowers in our list of perennial plants,

The Window Garden AND GREENHOUSE.

A PRETTY GREENERY.

In the endeavor to beautify our homes, the material nearest at hand, and the means within easy reach of every one, are too frequently ignored. Delicate exotics, which after a short time look sickly and forlorn, are procured at considerable expense and trouble, while it is in the power of most readers of THE AMERICAN GARDEN, not only to transfer a bit of the loveliest part of the country into their drawing-rooms, but to anticipate spring while winter is still howling about them.

Every one knows of some nook, or retired grove, where the Blood-root or *Sanguinaria canadensis*, by the middle of April, will be spreading out a delicious carpet of its white flowers. An investigation of such a nook, early in March, will reveal the fact that very near the surface of the ground may be found the roots of the *Sanguinaria*, in great abundance. The upper ends of the roots will be plentifully supplied with brown, elongated buds not unlike a small eger in appearance. By exercising a little care the entire roots may be taken up without breaking or injury, and so that some of the natural soil remains attached.

It is also well to take some of the moss that is invariably found where the Blood-root abounds. With the addition of a little earth and some moss for protection, put in a box or basket, this itinerant garden may be safely transferred to any distance.

For the planting of the garden, take a large meat dish, or platter—any flat dish will do; sprinkle a little of the earth on the bottom of the dish, then place the roots upon it, keeping the long brown buds on the upper side, crowd them quite closely together, sprinkle on the remaining earth, and cover very lightly with moss. Place the dish in a sunny window, sprinkle gently with lukewarm water mornings and evenings, and you will soon be rewarded with a bed of exquisitely white flowers, which, after they have performed their mission of beauty will be succeeded by a mass of very large irregular shaped leaves at the top of rather long individual stems, giving the whole the appearance of a miniature grove.

S. H. H.

MARANTA.

This genus comprises some of the most beautiful and ornamental foliage plants known. All are natives of the tropical zone of the New as well as the Old World. Some of the species are cultivated in their native countries for their tubers, which contain considerable nutriment.

The Arrowroot of commerce is derived principally from *M. arundinacea* and *M. Indica*. Under cultivation in the greenhouse the plants require rich, peaty soil, high temperature, and plenty of water while growing, and protection from direct sun.

DIEFFENBACHIA.

Plants with light-green foliage, thickly dotted with irregularly shaped, mostly white, blotches. All are very slow and ornamental,

and some of the species contain a decidedly poisonous juice. They are indigenous to tropical America, and require therefore a very warm house for successful cultivation. A compost of rich loam, leaf-mold and sand is best adapted to their growth, and for the full development of the brightest colors of their foliage, they should be grown in full light near the glass.

THE MYRTLE.

In going about the country if you come into a German settlement you will find, in

MARANTA.

almost every house, a Myrtle; and generally you will find a fine specimen of this plant, for our German friends seem to have the "knack" of growing it to perfection. I know of Myrtle trees ten and twelve years old, standing from five to six feet high, with branches reaching out two feet on each side of the straight central stem, forming a dense mass of shining foliage. One such plant

DIEFFENBACHIA.

will fill a window by itself, and is worth a dozen ordinary plants. It will afford more pleasure, and is more easily cared for. I have now in the room in which I write a Myrtle over three feet in height, and nearly as wide, and many of its branches are starred with beautiful white flowers. It stands before a window alone, on a pedestal of its own, and receives more attention from visitors than any other plant in the room.

One reason why I like it is, it is always so

bright and clean, and has such a vigorous, healthy look about it. A great many plants fade and have a sere-and-yellow leaf air about them, after being kept in an ordinary living-room a little while. Not so with the Myrtle. If its leaves get dusty, take it to the sink and shower it with water. It will come from its bath looking like a child that has just had its face washed, and will seem to laugh all over with thankfulness to you for what you have done. It is an evergreen, and the branches are always covered with leaves of a dark, rich green. The color of them is like those of the Ivy, and what the Ivy is among vines for the house, the Myrtle is among plants of a shrubby character. Like the Ivy, all it asks is to have plenty of good soil to grow in, and to be kept clean. Given these attentions it will ask no more.

With a Myrtle, an Ivy, a Calla, and a Geranium, you have a quartette of plants that will afford you better satisfaction than any other four I can think of. They are the most easily cared for, and are sure of doing well in the dry air of our sitting-rooms if they are given an occasional shower-bath. Other plants will succeed tolerably well, but these will give you more pleasure, because they will be more vigorous and healthy. It will do well in a window with a northerly exposure.

It likes fresh air, and once a day the sash ought to be lowered to let in a current over its head. The other plants in the room and the persons in it will be all the healthier for doing this. It does not form roots very rapidly, and therefore young plants do not require large pots; but, as it increases in size, it should be occasionally shifted to larger ones. It likes a rich soil, made up of one part well-rotted manure, one part ordinary garden-mold, one part leaf-mold, with enough sharp sand added to keep the soil open and light on the surface. But I do not put in any sand with the soil in the bottom of the pot. I think it does better where the soil is compact about its roots. The sand added to the surface-soil keeps it from baking over, or hardening, from heavy waterings—the Myrtle likes a good deal to drink—and admits air to the roots.

It strikes readily from cuttings, if you can give them some bottom-heat, but without it I have seen them wait for weeks and weeks before putting out any roots, as if undecided about what to do. I generally strike them in clean sand. I fill a deep plate with it, add water until it is thoroughly saturated, and insert the cuttings I desire to root; then cover the sand in the plate with a glass which keeps in moisture, and place the plate on an upper shelf or bracket, where it will get the benefit of the warm air that rises. In this way I seldom fail to get cuttings to start.

EBEN E. REXFORD.

VALUE OF SAND.

Sand is very essential in window gardening, and it is well to have a box of it placed in the cellar where a supply can be obtained when needed. Warm it in the oven, so as not to chill the plants, and whenever the surface soil seems heavy, or a green mold forms, dig it into the pot with a large hair-pin, and mellow the soil. A large hair-pin is an excellent implement in house-gardening, as it stirs up the soil in the pots so easily, without throwing it out.

STEPHANOTIS FLORIBUNDA.

Few white-flowered plants equal this in wax-like purity, gracefulness of form, and delicate perfume. Like the *Eucharis Amazonica*, flowers of the *Stephanotis* are everybody's favorites, and they will last fresh for several days after being cut—a valuable property in the case of flowers grown for market purposes. For button-hole bouquets, about three single flowers or buds, backed by a bit of Maiden-hair Fern or Froud of a Davallia, look remarkably well. They are well adapted for bouquets, and are used largely along with Orange Blossom in bridal bouquets; while, as a wreath for ladies' hair, nothing can be prettier than a cluster or two of expanded blossoms and unopened buds of *Stephanotis*, backed by its own thick, rich-green leaves. In forming wreaths of this description, the old or well-developed foliage only should be employed, as the fresh young leaves soon droop and wither after being cut from the plant.

The *Stephanotis* is easily propagated by means of cuttings made of the young wood, leaving a heel of old wood at the base. These should be inserted in a prepared cutting-pot, and covered with a bell-glass, placing the pot in a genial bottom-heat, either in a pit or propagating case; in the latter case, the bell-glass may be dispensed with. The young plants grow freely if liberally treated—that is, if planted in good fibrous loam, crocks, and leaf-mold, to which sufficient coarse sandstone grit has been added to keep the soil open. In a compost of this kind the growth made is short-jointed and robust, and much more floriferous than coarser growth made by plants in well-manured composts.

A warm and genial temperature, where it can be trained close to the glass and fully exposed to the sunlight, is most grateful to the plant. It grows freely trained on glass partitions or back walls, but rarely flowers so well as when fully exposed nearer the glass. Some growers for market cover the roofs of their forcing houses with this plant, and obtain crops of its pearly, deliciously scented flowers for nine or ten months out of twelve. It grows well in pots, in which it forms a fine exhibition plant, and it is one of the most striking of all plants thus treated; but, where quantities of cut blooms are required, pot culture is too troublesome, and does not pay half so well as when the plants are planted out and trained on the roof. They should be pruned in rather closely about December or January, and they may be started into growth as required by means of a little extra heat and moisture.

The *Stephanotis* is liable to become infested with mealy bugs, which spoil the looks of the foliage; and if this proliferous pest be not kept in check, the clusters of the flowers also become infested. The best means of obviating this state of things is

extreme cleanliness, for mealy bugs rarely appear unless a plant has been neglected or irregularly treated with regard to moisture. Frequent syringings with water at from 80° to 100° will be found an excellent preventive of insect pests, and the plants seem to thoroughly enjoy this warm bath daily all through the summer—precautions being taken not to wet the fully expanded flowers. This seldom happens where flowers are grown for cutting, every cluster being cut as soon as ever the buds show signs of opening, and the unopened buds are rather benefited by syringing than otherwise.

A great deal depends on regular syringing, as above directed, and occasionally sponging over with soap and water. At the time the plants are cut back they should be carefully cleaned throughout, using soft soap and warm water, and syringing afterward with clean soft water.—"C." in *London Garden*.

STEPHANOTIS FLORIBUNDA.

PILOGYNE SUAVIS.

One of the best vines for house culture is the *Pilogyne*. It has leaves shaped something like those of the Grape, but smaller, of a clear, bright green. It is a most rapid grower, branching very freely. It throws out long tendrils from the axil of each leaf, and these twine about everything with which they come in contact, thus supporting the plant without tying. It is therefore well adapted to use on trellises or for training of strings about the window or around the room. It does not seem to care particularly without much sunshine.

The only thing that has ever troubled my plant, is the mealy bug, which seems to have an especial liking for it. I find but little trouble in getting rid of this pest, if I apply kerosene to him by means of a feather.

The oil does not seem to injure the plant any. What it might do to more delicate plants I am not able to say, as no other plants of mine have been infested.

The *Pilogyne* is very graceful when grown in a hanging basket or vase. I have had the best success when I grew it in a mixture of loam and sand. Keep the plant pinched off close to the pot until plenty of branches form. It bears a small white flower which is not at all conspicuous. The plant is valuable only on account of its profuse and pleasing foliage and its rapid, graceful growth. It can be used out of doors during the summer, to climb about the veranda or porch. Give it plenty of strings, and it will form a very charming screen.

It grows readily from cuttings. I have a long box filled with it. To the box is attached a square trellis, which is completely covered with the vine. As the box is on casters, I have a portable screen for use in the parlor much more attractive, to me, than any painted screen could be.

SMILAX FOR WINDOWS.

The chief cause of failure with this graceful vine as a window plant, is the dry heat and the dust of the rooms. Where these can be avoided, there is no difficulty in growing it as successfully in a room as in a greenhouse. The seed, which is slow to germinate, is sown in winter, up to March. When the young plants are three inches high, they are pricked out or potted in small pots, shifting them again to larger ones as they increase in size. A soil composed of well-decayed sods and cow-manure is most suitable for *Smilax*. During summer the plants may be kept outdoors in a partially shaded position, removing them to the house at the approach of cold weather.

MAHERNIA.

Mahernia odorata, which is the species principally grown, is a very neat little shrub of about two feet in height, and is one of the prettiest and

most satisfactory window plants. It is a native of the Cape of Good Hope, and was introduced to cultivation in the early part of this century. Its fragrant yellow, bell-shaped flowers are borne in greatest profusion, blooming all winter, and entirely covering the plant. Ordinary potting soil, consisting of decayed manure, loam, and sand, suits it best; it should be kept rather moist, but not constantly soaked, and receive as much direct sunlight as possible.

OLEANDERS.

A French catalogue before us contains not less than forty distinct and named varieties of *Laurel Roses*—under which name they are described—varying in all shades from white and yellow to rose, earmine and purple.

Lawn and Landscape.

ESSENTIALS IN A GOOD LAWN.

Hardly anything about an estate, whether large or small, so completely marks the style of the master as the treatment, appearance, and adornment of the lawn. It is the most attractive and fascinating feature in landscape gardening; and to harmonize its trim, clean, and velvety appearance with the more rugged and broken foliage of the evergreens which border it, is the most gratifying success of the gardener.

The principle which should guide in the treatment of the lawn is very different from that which directs all other attempts to beautify and adorn the grounds—for this reason, that when the ornamentation sought is by the introduction of trees, we select the most perfect types of their species, so that the copse or plantation will assume a truly natural appearance. On the other hand, the lawn in its perfection is purely artificial in everything that makes its distinguishing characteristics. The surface must be made as smooth as possible. The turf is cultivated simply as turf, and not to grow grass for forage. In the hottest rays of the sun it must not sere nor blanch; it must be a velvety carpet of living green from early spring-time until frost and snow. The designer must have the art to conceal its artificial character, and make it appear that this elegant and emerald surface, soft and delicate enough for a fairy dance, is the most natural thing to expect to find in the midst of its fringing plantations, and that the residence was put where it is that the owner might enjoy this bit of loveliness.

A lawn must be of such a size that the proper treatment in harmonizing its surroundings will not dwarf its appearance and cause it to look like an Oak opening. When the lawn comprises hundreds of acres, and with its plantations assumes the character of a park, no specific rules can be laid down, but each case must have special treatment. Some pieces of grass, which the owners think charming lawns, are surrounded with rows of trees as stiff as a line of marines at a ship's gangway.

Most lawns are surfaced to a true plane, and have the appearance of sagging at the center. This arises from an optical illusion, to correct which a gentle swell should be given to it, and this (by a careful study of the contours before starting) can be done with little difficulty.

The next point is drainage, which, if the land is dry and gravelly, will not need any artificial aid, but it is more difficult to make a good lawn on such soils. If the subsoil is gravelly clay or hard-pan, it must be drained with pipes laid four feet deep and thirty to forty feet apart. If the soil is too light, it will be greatly improved by spreading from two to three hundred loads to the acre of clayey material. This should be such that the action of the frost will thoroughly pulverize it. In the spring it should be plowed in as deeply as can be done with the best plow and team attainable. A good dressing of peaty muck will do much to improve such a soil. To this should be added a bushel of salt and a bushel of lime to the cord, the salt being dissolved and the lime slaked

with it. The muck will be the better for having been exposed to the frost of winter.

If the subsoil is clay or hard-pan, the best method of loosening it up is by deep plowing, running the plow three times in the same furrow. By this means a depth of two feet or more can be reached, and the grass will be enabled to stand the drought, more especially if the land be under-drained, as recommended. When the cost is not restricted, trench the soil from two and a half to three feet in depth, laying the drain tiles as the trenching proceeds. After the surface is well pulverized, seed down with net less than three bushels of mixed Blue Grass and White Clover to the acre—say two and a half bushels of Blue Grass and the rest Clover and fragrant Vernal Grass. Some would add Timothy or Red-top, or both, or would till the lawn the first year, or would sow Oats or other grain with the grass, as is done in laying down ground for a grass crop; but these practices are not to be recommended. If the soil is good average land, treated as described, no manure or fertilizer will be needed; but wood ashes, leached or unleached, and old lime rubbish may be freely spread on the surface and carefully incorporated with the soil. Endeavor to sow the seed just before a change of weather which indicates rain. After sowing, harrow in well and roll with a garden roller. As soon as the grass is well started, roll it one day and cut it with a lawn mower the next, and follow this up every ten days. If the lawn is finished in May, by autumn you will have a good velvety turf.

As to boundaries, most lawns bound on the highway, and are often fenced with stone walls. If the lawn is on a level with the top of the wall, thus hiding it from sight, no change is necessary, but otherwise it should be removed; and if a fence must be maintained, let it be of wire, with light iron standards. But it looks more ample and generous to merge the lawn in the sidewalk, as if it were a part of the grounds. The practice of discarding walls and fences between the highway and the lawn is becoming more general, and has many pleasant features, with many drawbacks, which are largely the result of local peculiarities, prejudices and misdemeanors.

It will be well to border the lawn with plantations of trees, the manner of doing which is to be determined by the views to be obtained from the house, which control every other consideration; but if views of distant scenery or of water cannot be incorporated into the vistas of the lawn, it is best to border with plantations of evergreens, with an irregular margin of smaller trees and shrubs, forming inviting nooks, which are delightful for their sunny warmth in spring and fall. If the trees are well grown, so as to throw out their branches close to the ground, the surface of the lawn will seem to merge with the foliage of trees with a delightful illusion.—Col. H. W. Wilson, before the Massachusetts Horticultural Society.

HARDINESS OF AZALEAS.

A correspondent from Halifax states that the Pontic Azaleas are quite hardy in Nova Scotia. He has grown them over ten years without winter covering, and they flower regularly every spring. *Rhododendron Catawbiense* he finds also hardy there.

Foreign Gardening.

A FLOWER-LOVING CITY.

In his interesting series of letters on "Industrial Germany," to the New-York Tribune, Robert P. Porter gives the following vivid sketch of a market day in Chemnitz, Saxony: "Saturday is a good day to see the people out, for that is market day. The wares exposed for sale comprised almost everything.

"Flowers and ferns and evergreens abounded everywhere. Crowds of buyers were coming and going: men with yellow caps and blue blouses; women with wide striped gowns of every imaginable color, and red, yellow, or blue handkerchiefs over their heads, and menstros baskets strapped to their backs—these were the laborers of the day. There were young women with their hair well braided, and sometimes parted on one side, which, with rather short dresses, bright-colored stockings, and neat shoes, gave them quite a jaunty appearance.

"The crowd were buying every conceivable thing: some trying on coats, others fitting boots, others picking out cheap finery, others buying provisions—all buying flowers. Such people for flowers in large quantities I never before met with. The old, the young, the plain, the pretty, the well-to-do, the poor, all left the market laden with flowers—mostly wreaths. To see them one would think the town of Chemnitz had gone wreath-mad. The mania appeared in every form. Old brown-skinned matrons moved slowly home laden with baskets of provisions on their backs and wreaths of flowers encircling their arms; young girls briskly left the market carrying their purchases, and around their necks and arms garlands of flowers; little children trudged home lugging huge baskets, but also laden with wreaths of flowers. I actually saw several poor women without shoes and stockings buying wreaths of flowers."

THE FLORA OF JAPAN.

A letter in the *Evening Post* from Japan says: The flora of Japan is as extensive as the fauna is limited. We did not see a single wild animal in all our journey, and only once or twice heard a bird chirrup. But even at this unfavorable time of the year we found plenty of strange faces in the floral world, and many old friends on every hand, here growing wild, though elsewhere known to us only in flower gardens. Here was the Cyclamen, Azalea, and Camellia, all flourishing with great luxuriance. Here were great banks of Rhododendrons, thrifty Wisterias and Dentzias. Graceful Caladiums grew also by the wayside. They are much cultivated by the natives as an article of food.

The leaves of the Maples were turning, and supplied almost all the hues between the deep crimson of the Mountain Ash and the brilliant green of the shapely Bamboos. The mountains were densely wooded from base to summit, a condition rather rare than common. But the picture would not have been complete without the background of dark Conifers upon which the gorgeous colors of the deciduous trees were imposed. Once soon, those giant trees, with their trunks often hidden by Ivy, cannot be forgotten.

Horticultural Societies.

NEW YORK HORTICULTURAL SOCIETY.

The February meeting of this Society was remarkable for the large number of unusually meritorious exhibits, and the number of really beautiful plants on the tables was so great that it would have been a difficult task to decide which special exhibit deserved the palm.

The Rose table found most admirers. Hundreds of persons were constantly crowding around it, so that it was an impossibility to get near enough to it to examine its precious load carefully.

The *Sunset Rose*, of which P. Henderson & Co. exhibited a large bunch, attracted probably more attention than any other variety. There can be no doubt that the quality of the Roses grown in the vicinity of New York is constantly improving, and any one who has seen these magnificent bunches of Catherine Mermet, Cornelia Cook, General Jacqueminot, Niphetos, Safrano, Perle des Jardins, and many others, will agree with us that their excellence has rarely, if ever, been equaled.

Oreids were represented in large numbers and great variety, the most gorgeous collection being that of Mr. William B. Dinsmore. So magnificent specimens as the half a dozen spikes of *Phalenopsis Schilleriana*, each about a yard in length, and thickly covered with flowers, had never been seen by any one present. The same collection contained a fine specimen of *Cattleya Trianei*, with unusually dark flowers; also a dozen immense spikes of *Phajus grandiflorus*, and several others. A grand specimen of *Schomburgkia undulata*, with its large, rich-colored and singularly shaped flowers was shown by William Haxtur. Isaac Buchanan, James Tapiu, and George Such had also many fine specimen Oreids.

The table directly fronting the entrance was, as usually, occupied by Woolson & Co., and their exhibit of brilliant *Anemones fulgens*, Hybrid Narcissus, Freesias, and a large number of pretty spring-flowering perennial plants, gave one a bright greeting at entering the hall.

Chinese Primulas, by several exhibitors, were of astonishing size; some of the plants measured nearly two feet in diameter, and varied in all shades and forms possible in a Primrose.

Lilies of the Valley were out in great force, and delightful to behold. Most of them were growing in nine-inch pots, twenty-five to thirty "pips" to a pot.

Begonia Bruatthi, a pure white variety, very compact, and a profuse bloomer, was exhibited by Hallock & Thorpe. There was also a beautiful specimen of *Begonia glaucophylla*, about twenty inches in diameter, drooping over the rim, and completely covering the pot.

A large collection of brilliant and well-grown *Cinerarias* was exhibited by David Clarkson. In *Cut Flowers*, Charles E. Parnell made, as usually, the most attractive display.

Hyacinths, Tulips, Cyclamens, Lilacs, Violets, Mignonotte, Azaleas, Camellias, Amaryllis, etc., in large numbers and mostly of great excellence, and a few collections of forced vegetables made up the remainder of this fine exhibition.

Miscellaneous.

THE GENTLEMAN FARMER.

He owned the farm—at least 'twas thought
He owned, since he lived upon it,—
And when he came there, with him brought
The men whom he had hired to run it.

He had been bred to city life
And had acquired a little money;
But, strange conceit, himself and wife
Thought farming must be something funny.

He did not work himself at all,
'But spent his time in recreation—
In pitching quoits and playing ball,
And such mild forms of dissipation.

He kept his "rods" and trolling spoons,
His guns and dogs of various habits,—
While in the fall he hunted coons,
And in the winter stunks and rabbits,

His hired help were quick to learn
The liberties that might be taken,
And through the season scarce would earn
The salt it took to save their bacon.

He knew no more than child unborn,
One-half the time, what they were doing,—
Whether they stuck to hoeing corn,
Or had on hand some mischief brewing

His crops, although they were but few,
With proper food were seldom nourished,
While cockle instead of barley grew,
And noxious weeds and thistles flourished

His cows in spring looked more like rails
Set up on legs, than living cattle;
And when they switched their dried-up tails
The very bones would in them rattle.

At length the sheriff came along,
Who soon relieved him of his labors,
While he became the jest and song
Of his more enterprising neighbors.

Back to the place where life began,
Back to the home from whence he wandered,
A sad if not a wiser man,
He went with all his money squandered.

MORAL.

On any soil, be it loam or clay,
Mellow and light, or rough and stony,
Those men who best make farming pay
Find use for brains as well as money.

—Tribune and Farmer.

A NATURAL AQUARIUM.

The Granton quarry, on the east coast of Scotland, admits the tide, so that at high water the inlet has a surface area of about ten acres, and a depth of sixty feet in some parts. The mouth of this inlet is to be so closed that fishes and other marine animals may be unable to pass through it, while the circulation of the sea water will remain unobstructed. The inclosure will form a natural aquarium, which is to be stocked with marine life of all kinds. A laboratory for students is to be placed on a barge anchored in the quarry, additional quarters being provided in a cottage on shore. This curious scientific aquarium is being established under the auspices of the Scottish Meteorological Society.

It would seem that in such an aquarium the "submarine balloon" might be used to advantage. This is a device which will be used at the forthcoming International Exhibition at Nice, and is made of steel and bronze, to enable it to resist the pressure of water at a depth of 120 meters, nearly 160 pounds to the square inch. The vessel is divided into three compartments: the upper for the commander, to enable him to direct

the observatory and give explanations to the passengers, who, to the number of eight, occupy the middle compartment. They have under their feet a glass plate, enabling them to see the bottom of the ocean with its corals, fishes, grass, etc. The third compartment contains the buoyant chambers, whose power of flotation can be regulated at will. As the sea is dark at the depth of 70 meters, the observatory is to be lighted by electricity, and a telephone communication with the surface.—*The Continent*.

NEW USE FOR PAMPAS PLUMES.

Having in view the immense quantities of plumes below the standard required for purposes of ornamentation, which remain on the hands of producers unless worked up in some industry, a correspondent of the *Santa Barbara Independent* was induced lately to try, on a small scale, a series of experiments with the plumage (if it may be so called), which were sufficiently successful to convince him that there are possibilities attending the cultivation of this plant as yet unthought of.

"By experiment," he says, "I find that the feathery down possesses remarkable elasticity, and, on being removed from heavy pressure, it recovers from its compactness more readily than other vegetable fibers; but the most singular characteristic of the plumage is its buoyancy. As compared with cork there is no difference in buoyancy,—weight for weight, the displacement of water is the same, and on being submerged the plume regains the surface as quickly, and, if anything, beats the other 'light weight' in point of time. For twelve hours I could find no perceptible loss in the buoyancy properties of the plumage, not becoming water-logged, as did other grasses experimented with in the same way for the same length of time. Now, I have formed no conclusion from the result of my crude experiment, but will bequeath to some enterprising genius the idea of constructing a camp-bed suitable for land or sea, so that even those who are compelled to 'go down to sea in ships' may take up their beds and walk—overboard, and float to realms of safety, in case of disaster."

A DAINY TABLE DECORATION.

The unique table decoration for a dinner-party, given recently at a French castle, is thus described:

"Along the center a sheet of plate-glass, framed with a little balustrade in silver, and mounted on low, silver deer's-feet. On this glass were strewn cut flowers, with occasional groups of dancers in Dresden porcelain. A garland of odorless flowers was around each plate, and at each lady's place was an engraved crystal flask inclosing a perfume, for her to inspire in case she does not like the odor of game. The menu was engraved on ivory leaves, in red and black Gothic lettering."

THE WORLD'S SUGAR SUPPLY.

According to the *Sugar Beet*, nearly one-half of the entire world's consumption of sugar is manufactured from Beets. Franco produces annually over four hundred million pounds of raw Beet-sugar, and Russia over five hundred million pounds.

OUR BOOK TABLE.

Massachusetts Horticultural Society.—Schedule of prices for the year 1884. This is a most liberal premium list, \$3450 having been appropriated for prizes; and competition is open to all persons.

Tea and Coffee: Their Physical, Intellectual and Moral Effects on the Human System. By Dr. A. Alcott, with notes and additions by Nelson Sizer. 16mo, 118 pages; paper, price 25 cents. Fowler & Wells, Publishers, 763 Broadway, New-York. Dr. Alcott's work on the use of Tea and Coffee, first published many years ago, has done much to call attention to the effects of the use of these articles. In the new edition Mr. Sizer has presented in the form of notes many additional facts brought out by the increased knowledge of the subject.

Hon. Marshall P. Wilder, Ph. D.—Proceedings at a banquet given by his friends on his birthday, September 22d, 1883, to commemorate the completion of his eighty-fifth year.—This is a large, very handsome volume, containing Colonel Wilder's address and all the speeches made on that memorable occasion, as well as the letters of many persons who were unable to attend. A most excellent portrait of Col. Wilder, and this, with some kind words and his autograph, written in a clear, firm hand on the fly-leaf, make the volume of precious value to us. May he be able to celebrate many, many more birthday anniversaries in health and happiness; to receive the congratulations of his many devoted friends, as well as the well-deserved gratitude of a grateful nation.

CATALOGUES RECEIVED.

Edward Gillett, Southwick, Mass.—Catalogue of North American Plants, Orchids, Shrubs, Climbers, Alpine, Aquatic, and Bog Plants, Rare Ferns, etc.

H. S. Anderson, Cayuga Lake Nurseries, Union Springs, N. Y.—Descriptive Catalogue and Price-list of all the leading new and older varieties of Small and Tree Fruits; also, ornamental trees and shrubs. It contains an elegant colored plate of the Duchess Grape, which is made a specialty here.

Woods, Beach & Co., New Brighton, Pa.—Illustrated and Descriptive Catalogue of Roses and Bedding Plants. This firm is head-quarters for the new *Althornanthera aurea nana*, and makes a specialty of sending Roses by mail, in which branch they have reached an enviable reputation.

John S. Collins, Moorestown, N. Y.—Illustrated Catalogue of Small Fruit-plants and Fruit-trees, with a colored plate of the Kieffer Pear. This is a complete list of all the most valuable varieties in cultivation. The most prominent specialty of the season is the Early Cluster Blackberry.

Hale Brothers, South Glastonbury, Conn.—Descriptive Price List of all the leading new and old Small Fruits. This firm pays special attention to pedigree in plants, and claims to have as carefully selected stock as can be found in the country. Mrs. Garfield Strawberry, a variety of unusual promise, and Pratt Peach, now introduced, are the leading specialties.

Woolson & Co., Passaic, N. Y.—Catalogue of Hardy Perennial Plants, Bulbs, Ferns, and Climbers. This is a general collection of everything of value in this line. By making an exclusive specialty of this class of plants, this firm has been able to accumulate the most complete collection of its kind in the country, and to do much to stimulate an interest in the cultivation of hardy perennial plants.

E. & J. C. Williams, Chestnut Hill Nursery, Montclair, N. J.—Descriptive Catalogue of Small Fruit Plants and other Nursery stock. This is what may be termed "a catalogue for the busy," as it dispenses with all unnecessary talk and with all inferior varieties, giving the reader at a glance a summary of the very best varieties only of each class. Colored plates of Fay's Prolific Currant and James Vick Strawberry. Head-quarters for Montclair Raspberry.

ANSWERS TO CORRESPONDENTS.

Zanzibar Balsam.—Subscriber, Columbus, O.—If "Subscriber" will send her name, the desired information will be sent by postal card.

Inquiries should always be accompanied by the full address of the sender, that in case they are not of sufficient general interest they may be answered by letter.

Plants for Sunny Exposure.—Mrs. P. O. L.—There are comparatively few plants that will not thrive in a sunny exposure, provided the ground is deep, mellow, and rich, so that the roots may penetrate sufficiently to obtain moisture and nourishment. Fuchsias, Begonias, Variegated Caladiums, Ivy, etc., will not do in the sun.

Rose, Madame Margotin, W. R. H. S., Forest, Ohio.—The true variety of this name is citron-yellow, sometimes with coppery center, large, full, and very fine when perfect. It is apt to produce some malformed flowers, yet it is rarely so unsatisfactory as described. Your plant may not have sufficient root action to perfect its flowers; and a liberal supply of manure-water, when in bud, will probably correct the difficulty. And then again the plant may not be the true *Mme. Margotin*. Several other varieties, *Souvenir d'Elise* especially, behave as described.

Grapes for Utah, C., Salt Lake City.—To determine which varieties succeed best in so peculiar a climate as that of Utah, there can be no reliable guide but actual experiment. The list given in our Fruit Department may be of some service; but if there are any Grapes grown successfully in the vicinity, these are the varieties to be depended on, and others should be planted only as an experiment. Two-year-old vines, severely cut back, are generally the best, and early spring, as soon as the ground is fit to work, is the best season for planting.

Propagation.—N. T. L., Astoria, N. Y.—Without a minute knowledge of all the conditions under which plants are placed, it is impossible for any one to tell why cuttings fail to grow. A frequent cause of failure is that the cuttings are taken from weak or sickly plants; another, that the propagating bed is not warm enough—it should be kept at a temperature of from sixty to seventy degrees, and the house at about fifty degrees; then the sand in which they are placed should never become dry—no subsequent watering will make up for the damage done thereby. Fuchsias, Heliotropes, and similar plants, if under proper conditions, should root in ten days.

Japan Clover, *Lespedeza striata*.—Some item extolling the praises of this plant has been extensively published, and consequently brought a number of inquiries. This is an annual, leguminous plant of low growth, coarse, hard wooded, with small, scant foliage. It is not a Clover proper, does not look like it, and is not in the least to be compared with it as a forage plant. Being an annual, the plant dies down every year, but springs up and spreads freely the following season from self-sown seed. The principal point in its favor is that it grows in poor and sandy soil, and in such places, where nothing better can be raised, it may be of some value, and worthy of a trial in the Southern States; it does not thrive at the North. It is not a new plant, however, which impression it seems intended to make, but has been known in our country for forty years or more. That the valuable and wonderful qualities alleged to a plant of so easy and rapid growth should not have been discovered by our progressive cultivators of the South, during half a century, does not seem very probable.

Shipping Strawberry Plants Great Distances.—B., Kansas.—Strawberry plants to carry well should be sent while in dormant state—that is before they have started into growth, and during cold weather. There is very little danger that they suffer from cold, when properly packed, but a great deal of becoming injured by heating. They should be packed in flat boxes of a height to correspond with the length of the plants and roots. If the plants have to be bundled, the bundles should be made small, not over twenty plants to each. It is also important that the plants be tied together evenly, so that all the crowns are in a line, and not some of them pushed up among the leaves and others buried among the roots. When damp moss spread on the end board, and then a row of bundles of plants laid across, close together, the tops of the leaves being on a level with the upper side of the box. Another layer of moss is spread over and worked among and under the

roots, and so on until the box is filled. The important point in this operation is to keep the crowns and leaves free from contact with damp moss. The roots only should be kept damp, but the leaves and hearts of the plants as dry as possible. Now nail up with strips not closer together than is necessary to prevent the plants from falling out, in case the box is turned over. Plants packed in this way should, at this season of the year, keep a month. There is another precaution, however, when they arrive at their destination: Some station agents make it a rule—well meant, no doubt—to throw a pailful of water over every box of plants that arrives, and consequently kill half of them. Instruct your agent beforehand not to water your plants when they arrive.

The Acme Pulverizing Harrow, manufactured by Nash & Bro., Millington, N. J., is, without exception, the most valuable and most efficient implement for leveling and pulverizing the soil that has ever been invented; in fact, there is nothing in existence at all to be compared with it. We have had personal experience with all the leading harrows introduced within the last twenty years, but would give the whole lot of them—a dozen or more—for one Acme. It would be superfluous to specify the good qualities of an implement that combines in the highest possible degree every point attainable in its class. Those who doubt the correctness of these statements had better send for the new pamphlet just issued by the above firm. This contains the testimony of over two thousand farmers who have been and are using the harrow; and if, before you have read half of it, you do not send for an Acme, don't complain if your brother farmers make farming pay better than you do.

The United States Mutual Accident Association, 320 and 322 Broadway, New-York, continues to extend its usefulness to every part of our country. With steam-boats blowing up every little while, as a matter of course, and cyclones sweeping away houses and whole villages, prudent people seek, naturally, to make some provision for themselves and their families in case of accident before it is too late. The honorable and fair dealing of this company with all its patrons has established for it so enviable a reputation, that no one who desires to insure against accident—and every wise person should—need hesitate to entrust his policy to this company.

J. B. Sardy & Son, 141 Water street, New-York, offer in our advertising columns \$50 premium to the one who raises the largest crop of Potatoes from half an acre of ground fertilized with their Phospho-Peruvian Guano; and \$25 for the next best crop. This seems an easy way to make money in addition to a paying crop. This fertilizer is highly recommended by Alfred Rose and other well-known agriculturists.

IMPORTANT.

When you visit or leave New-York City, save Baggage Expressage and Carriage hire, and stop at the **Grand Union Hotel**, opposite Grand Central Depot. 600 elegant rooms, fitted up at a cost of one million dollars, reduced to \$1.00 and upward per day. European Plan. Elevator. Restaurant supplied with the best. Horse cars, stages, and elevated railroad to all depots. Families can live better for less money at the Grand Union Hotel than at any other first-class hotel in the city.

BRAIN AND NERVE FOOD.

FROM THE NERVE-GIVING PRINCIPLES OF THE
DEX-BRAIN AND WHEAT GERM.

Vitalized Phosphites.—Restores the energy lost by nervousness, weakness, or indigestion; relieves lassitude and neuralgia; refreshes the nerves tired by worry, excitement, or excessive sensibility; and strengthens a failing memory. It aids wonderfully in the mental and bodily growth of infants and children. Under its use the teeth come easier, the bones grow better, the skin smoother, the brain requires more readily and sleeps more sweetly. An ill-fed brain learns no lessons, and is peevish. It gives a more intellectual and happier childhood. Not a secret remedy; formula on every label. For sale by Druggists, or mail, \$1. P. CROSSY & CO.
664 & 666 Sixth Ave. New-York.

TAKE NOTICE.

For 50c. (in stamps) 200 Elegant Scrap Pictures. No two alike. F. WHITING, 50 Nassau St., N. Y.

A Present to Every Subscriber TO THE AMERICAN GARDEN.

While we offer a choice of many fine things to those who take time and trouble to aid the publishers in extending the circulation of THE AMERICAN GARDEN, as a recognition of their kind efforts and as a reward or pay for such aid; and while we intend to and shall make THE AMERICAN GARDEN worth to every reader many times its small cost, yet we desire to give a friendly recognition of some direct kind to each one of our readers as far as possible; and having unusual facilities for securing valuable seeds, etc., desirable for use or for trial, we offer to every subscriber to THE AMERICAN GARDEN his or her own choice of any one of the Seed, Plant, or Bulb parcels named below.

THIS OFFER IS TO EVERY SUBSCRIBER, for one year, whether subscribing singly, or in Premium or other Clubs.

In sending your subscription or giving it to club gatherers, give in each case the letter indicating what you desire.

Our readers will notice that many of the things named are new and rare, and of extraordinary merit. To purchase these (if they could all be bought) would cost 25 to 50 cents each.

POSTAGE FREE. All the articles offered as presents below will be sent postage prepaid.

FLOWER SEEDS.

Directions for culture are given with each package.

A. Wild Garden Seeds.—A half-ounce packet. This novelty in flower gardening, which was first introduced as an AMERICAN GARDEN premium, continues to be a general favorite; and being in greater demand than ever, we retain it among our premiums. The present selection contains over 100 varieties of choice flower seeds, which, in single packets, could not be bought under \$5.00.

B. Single Dahlias.—A packet of seeds carefully selected from over 100 varieties, comprising all the most brilliant and decided colors. If sown in early spring, in pots in the house or in the hot-bed, flowering plants may be had by mid-summer.

C. German Pansies.—A packet of fifty seeds of these lovely flowers, of which one can never get tired. The seeds here offered are from the best and choicest collection in Germany.

D. Asters, Choicest Mixed.—The most desirable and valued varieties of the best German and French strains, are represented in these packets, which are vastly superior to what is generally known as Mixed Asters.

E. Everlasting Flowers.—A mixed packet of 12 distinct varieties. This class of flowers is constantly increasing in favor; and for winter bouquets and decorations generally nothing is more treasured. All are annuals of easy culture.

F. Ornamental Grasses.—A mixed packet of the twelve best varieties. As an accompaniment of flowers, fresh or dried, in bouquets or vases, nothing can be more appropriate and graceful than sprays of ornamental grasses.

VEGETABLE AND FARM SEEDS.

G. Pea, Bliss' Ever-bearing.—A sample packet of this extraordinary new wrinkled Pea, which is now, for the first time, offered to the public. For large yield, excellent quality, and continuancy of bearing, it has no equal.

H. Cauliflower, Sea-foam.—One packet. This valuable new variety combines more desirable qualities than any of the older kinds; in size and beauty, and especially in reliability of heading, it excels all others.

I. Water-melon, American Belle.—One packet, now first introduced, and of great value for home use as well as for market. It is very large, early, and of delicious quality.

J. Oats, Black Champion.—A sample package. These Oats were selected from a number of varieties received from Europe, and are of great promise. Selected heads have averaged one hundred and sixty-nine grains. The roots tiller more abundantly than those of any other variety, so that half the quantity of seed usually sown per acre is sufficient.

K. Barley, Imperial.—A sample packet. All reports about this new variety speak in highest terms of its excellence. In yield and quality alike, it is a valuable acquisition.

L. Potato, Tremont.—One tuber. A medium early variety of excellent quality; new offered for the first time.

M. Potato, Troguois.—One tuber. A large, handsome variety of good quality, large yield, and superior keeping quality; now first offered. Both varieties received First Class Certificates of Merit by the London Royal Horticultural Society at the recent great International Potato Exhibition.

PLANTS AND BULBS.

N. Helianthus multiflorus, fl. plen. Golden Sunflower.—A hardy perennial plant of great beauty, grows about four feet high and bears a profusion of rich golden-yellow flowers of the size of Dahlias.

O. Polyantha Rose, Mad. Cecile Brunner, the Fairy Rose.—This is an entirely new class of Roses, of dwarf habit, with bright flowers of exquisite fragrance; hardy and effective.

P. "Curiosity," a new early flowering Pompon Chrysanthemum, with brilliant, deep-bright crimson flowers tipped with golden yellow. This choice variety just introduced here is not for sale, but is offered only as a present to our subscribers.

Q. Clematis coccinea (Scarlet Clematis).—One of the most desirable climbers for covering verandas, trellises, arbors, screens, etc., as it grows from eight to ten feet in one season. Its coral-red flowers are produced in great profusion.

R. Eulalia Japonica zebrina.—A remarkably handsome variegated grass, perfectly hardy, growing to a height of six to seven feet, and producing tall, elegant plumes, highly ornamental for vases.

S. Lilium Wallacei, recently introduced from Japan. Flowers four to six inches in diameter, of clear buff-orange color, distinctly spotted with numerous black dots. The bulb is small, but perfectly hardy.

T. Amaryllis Treaclei, the Fairy Lily.—A delicate, pure-white flower, two to three inches in diameter, borne on slender stems 5 to 6 inches high. Suitable for the garden or house.

U. Strawberry, the Prince of Berries.—3 plants. For complete description and life-size illustration of this really superb Strawberry, see AMERICAN GARDEN, August number.

For other Premiums see General Premium List, mailed free on application.

"ONE CENT WELL SPENT!"

Send a Postal Card for the

AMERICAN GARDEN PREMIUM LIST.

Very Desirable, Useful, and Excellent

PREMIUMS

INCLUDING

A VALUABLE PRESENT...FREE to Every Subscriber to The American Garden.

SIXTY MOST VALUABLE ARTICLES, all of guaranteed, first-rate Quality, including many wanted in every Home, and by Every Person, Young or Old. Read the Descriptions in the Premium List.

FINE PRESENTS for HOLIDAYS, and all other days; for Wedding Gifts, and to Friends.

(See Premium List.)

DELIVERED RIGHT TO YOU, FREE, no matter how far off you live! FORTY of the Good Articles in the Premium List will be delivered, CARRIAGE PREPAID, to any place in the United States or Territories, however near or distant, whether given as premiums, or supplied at the prices named.

N. B.—The articles not offered "delivery free," will be carefully packed without charge, and forwarded by express or otherwise, as may be desired. The expenses of carriage will not be great. They can be taken at the office of AMERICAN GARDEN without expense.

GOOD THINGS TO BUY. Aside from any articles obtained free as premiums, almost every one will need, or desire to purchase some of the EXCELLENT THINGS described in the Premium List when they can get them of GUARANTEED QUALITY, and from a RESPONSIBLE SOURCE, and at the LOWEST PRICE they can be obtained anywhere of such excellence. A Price is therefore named with EACH article at which we will supply it delivered FREE, or otherwise, as above provided.

ENTERTAINING AND INSTRUCTIVE READING.—See in the Premium List what is said about "Dips," an amusing scene; six "Watch Items," especially the 7th; about "Washing Made Easy;" "Microscopes;" and a score of other things.

This reading will interest you, aside from what is said of the particular things referred to.

A DOLLAR an HOUR can easily be secured by many persons, LADIES included, (also by BOYS and GIRLS), thus: Show to friends and neighbors a specimen copy of the American Garden, its beauty and usefulness, and low cost. An hour's time should suffice to get 2, or 3, or 4 to take it. This will give you a dollar's worth, or MORE, of the valuable articles in the Premium List—articles better than their money cost. Why! it would pay many persons to continue this as a constant employment, and sell the premium articles received when not needed by themselves. N. B.—Any Premium club may contain subscribers from many Post-Offices.

ALSO NOTE, that in addition to your premium you can offer to every subscriber a FREE Premium, as noted in preceding column. (Several of these Seed and Plant parcels will be worth a full Dollar, or more, leaving the Journal free.)

THE AMERICAN GARDEN is a Large, Beautifully Illustrated Journal, printed on fine paper. It is specially devoted to GARDENING, FLORICULTURE, Fruit Culture, and to Horticultural interests generally. It is of GREAT VALUE in every Garden or Lawn, on the Farm, in the Village, or in the City. The Editors and Contributors are men who write and speak from their own large daily experience and observation. LADIES will find it specially useful in caring for their Flowers and Plants indoor and outdoor. (The Garden is by far the best paying plot on the farm, and adds immensely to the comfort and healthfulness of the home table. THE AMERICAN GARDEN will add many dollars to the products of even the smallest plot.)

What Others Say. Attention is invited to the Border of the first page of the Premium List giving a few of the multitude of similar voluntary expressions, coming from those who are and have been its readers for years past. The Editors and Publishers pledge themselves to make THE AMERICAN GARDEN increasingly valuable by their most earnest efforts, by additional assistance, and by Liberal Outlay for Illustrations, gathering information, etc., etc.

TERMS—One Dollar a year, Mailed Free. This includes the valuable parcel of Plants, Seeds, etc. See preceding column. 3 months' trial trip, 30 cents. Single number, 10 cents. Sample copy and Premium List FREE. Ditto, with colored plate, 10 cents.

paper. Address MONARCH MANUFACTURING
CO., 163 E. Randolph St., Chicago, Ill.

"ELLIS'S HORSE REMEDIES ARE THE BEST."

Solidly Indorsed by the "Spirit of the Times,"
and Leading Veterinary Surgeons.

"ELLIS'S SPAVIN CURE.—Of course it is generally
regarded as impossible to completely cure a bone
spavin and remove the enlargement; but it is positively
astonishing what curative properties exist in the mix-
ture known as Ellis's Spavin Cure, and those who
have given it a fair trial say it is the best remedy that
they ever applied. In many cases it has not only
removed the lameness, but also the lump, and we
recommend it as far superior to the ordinary blisters
prescribed by the faculty. We also learn that Ellis's
Comblion, Colic, Worm, and Heave Powders are the
best of their kind, and just what every horse owner
should have at hand ready for use."—May 12, 1883.

"I would gladly recommend your Spavin Cure to all
with perfect confidence as to the result," writes H. C.
Perry, V. S., Boston.

"We believe Ellis's Horse Remedies to be the best
articles on the American market."—Strauss & Imanen,
East 24th Street, New-York City.

Sold by all Druggists and Harness Dealers.
Our \$5 and \$10 assortments of Ellis's Horse
Remedies should be in every stable. Send for free
book of testimonials, describing all our specialties.

thing that has proved really desirable, introduced within the past two years, is now ready, and will be mailed
free to all applicants.

B. K. BLISS & SONS, 34 Barclay Street, New-York.

\$500.00 IN PREMIUMS

Offered for the Largest Yields of
PRINGLE'S NEW CEREALS, From One-Quarter Acre of Ground.

PRINGLE'S AMERICAN TRIUMPH OATS.
This is a cross between the Excelsior and Waterloo Oats, combining in
a remarkable degree the excellent qualities of both.
The average height, as the grain stands in the field, is six feet, yet the
straw is so strong and firm that it holds up well, without lodging; the
tall, luxuriant heads filled with plump, heavy grains. The quality and
productiveness of the grain are unexcelled, yielding from 60 to 100
bushels per acre, according to the condition and state of fertility of the
land.
Prices: By mail, \$1.00 per lb.; 3 lbs., \$2.50, post-paid. By express, at
purchaser's expense, per peck, \$4.00; bush., \$12.00.

PRINGLE'S ADAMANT SPRING WHEAT.
In this beardless variety we have one of the hardest and most flinty
varieties in cultivation, very productive, hardy, and vigorous. Straw
yellowish-white, very stiff and erect, averaging 4 feet in height. For
cultivation in North-west, Colorado, and the Pacific coast, where hard
wheat is the favorite sort, we are confident that this will be particularly
desirable.
Prices: By mail, \$1.00 per lb.; 3 lbs., \$2.50, post-paid. By express, at
purchaser's expense, per peck, \$4.00; bush., \$12.00.

**PRINGLE'S GREEN MOUNTAIN SPRING
WHEAT.**
This is another beardless variety of great promise. It has been grown for
the past two years by one of the most experienced wheat cultivators in
Northern Vermont, in close proximity to the Green Mountains, who
pronounces it the best he has ever grown. The straw averages about 4
feet, light yellow, very strong, and free from rust. Heads average 4 to
5 inches in length, somewhat tapering; kernels white, large, and plump.
Very hardy and productive.
Prices: By mail, \$1.00 per lb.; 3 lbs., \$2.50, post-paid. By express, at
purchaser's expense, per peck, \$4.00; bush., \$12.00.

The above varieties were first offered by us last Spring, and were extensively grown throughout the
country during the past season, and furnished ample proof of their excellence and superiority over the older
varieties. To induce an extended trial as possible, we offered liberal premiums to those who produced the
largest quantity of grain from one ounce of either of these varieties. The result is marvellous and shows what
can be accomplished by superior seed and good cultivation. The largest yields are as follows: The Triumph
Oats produced 168 lbs., Adamant Wheat 108 lbs., and Green Mountain Wheat 71 lbs., each, from one
ounce. The full report of the awards will appear in our Novelty Sheet, published in February, and will be
found of interest, as some valuable information and suggestions about grain-growing are given. A copy will
be mailed to all applicants.

NEW VARIETY SPRING WHEAT FOR 1884.

Pringle's Invincible is a beardless variety of remarkably robust and vigorous growth; the straw is strong,
stiff, well glazed, healthy, and stands up well in all kinds of weather. The heads are four to five inches long,
very compact, and uncommonly well filled; berry of light amber color, plump, hard, and very heavy. It is
wonderfully prolific; a bushel will easily produce fifty to seventy bushels, if properly cultivated. To obtain
such results, however, the seed must be sown thinly in drills, thirty to forty pounds of seed per acre being an
adequate quantity. The grain ripens quickly and remarkably evenly; care should therefore be taken not to let it
get over-ripe before harvesting.
As the result of many extensive trials, during the past five years, in various sections of our country, under
irrigation and without, we do not hesitate to recommend this new Wheat in highest terms to every wheat
grower in the world, fully convinced that it will everywhere give good satisfaction, yield profitable returns to
the grower, and prove second to none for milling purposes. Price, \$1.00 per lb.; 3 lbs., \$2.50, by mail, post-
paid. By express, at purchaser's expense, per peck, \$4.00; bush., \$12.00.

Every one can compete. No restrictions, except the seed must be bought of us this Spring.
Descriptive circulars, with full particulars, mailed free on application.

B. K. BLISS & SONS, 34 Barclay St. New-York.

COLLECTIONS OF SUMMER-FLOWERING BULBS.

Having secured a large stock of choice Summer-
flowering bulbs, we are pleased to offer the following
collections at a great reduction from regular prices.
Collection X, containing One each of Tigridia Con-
chillora, Grandiflora, and Grandiflora Alba; One Vid-
uola Purpurea; One Dozen Oxalis, assorted; Six finest
mixed Gladioli, and Six Tuberoses. Price, \$1.50.
Collection Y, containing Two Tigridia Conchillora;
Two Tigridia Grandiflora; One Tigridia Grandiflora;
Alba; One Vallota Purpurea; One Tigridia Grandiflora
assorted; One each Lilium Auratum, longiflorum,
and Temifidnum; Twelve finest mixed Gladioli, six
Tuberoses, and Three Anaryllis Formosissima.
Price, \$3.00.
Collection Z, containing Six choicest named Gladi-
oli; One Dozen mixed Gladioli; Two Vallota
Purpurea; Two each of Tigridia Grandiflora, Grandi-
flora, and Alba; One each Lilium Auratum, Grandi-
flora, Temifidnum, Speciosum Album, Cardium, and
Rosatum; Two Anaryllis Formosissima; Two Dozen
Oxalis, assorted, and Twelve Tuberoses. Price, \$5.00.

Randolph's Hand Seed-Sower,

For sowing all kinds of small Gar-
den Seeds with accuracy and dis-
pensation by a patch. It is easily operated by a
lady or a child of ordinary intel-
ligence, with a little practice.
Its cost is trifling compared with
the advantages resulting from its
use. The sowing in time and seeds
will undoubtedly repay the outlay
in the planting of a single week.
Its construction is so simple that
it is not out of
order.

NEW PANSY—BLISS'S PERFECTION.

AWARDED A FIRST-CLASS CERTIFICATE BY THE NEW-YORK HORTICULTURAL SOCIETY IN THE SPRING OF 1883.

Our previous efforts to improve this ever-popular flower, although attended with unprecedented success, are eclipsed by a new strain, **BLISS'S PERFECTION**, that we now have the pleasure of introducing, believing it to be the nearest to perfection of anything yet offered. In the colored frontispiece of our Hand-book, our artist has attempted to reproduce some of the types of this strain; but, beautiful as are these illustrations, we assure you that the originals far surpass them, and the copy, instead of being exaggerations, convey but a faint idea of the perfection of form and exquisite delicacy of shading in the flowers themselves. For variety of markings, beauty of form, large size, good substance, and splendid satiny texture, **BLISS'S PERFECTION PANSY** is unexcelled.

Per packet (50 seeds), 50 cents; 5 packets for \$2.00.

THE SHAKESPEAREAN COLLECTION

NEW EVER-BLOOMING CARNATIONS.

The important feature of this splendid strain of Carnations is that, if sown early in Spring, they will flower freely the first season. We can offer a limited quantity of seed saved from our own unrivaled collection, which, if treated according to directions, cannot fail to give perfect satisfaction. It has all been carefully hybridized by hand, and will produce not less than seventy-five per cent. of double flowers. Packets (containing 20 seeds, mixed colors), with complete directions for culture, 50 cents. For Plants of Shakespearean Carnations, see page 111 of our Hand-book.

Bliss's Illustrated Potato Catalogue.—Contains a list of 500 varieties of Potatoes, embracing new and very promising varieties, with explicit directions for culture, and much other valuable information respecting this indispensable esculent. 10 cents.

TWO NEW TOMATOES.

THE CARDINAL.

This new Tomato has been carefully cultivated and subjected to many tests during the past year or two, and has maintained a remarkable perfection in all that can be desired in a Tomato. It is of vigorous growth, yet comparatively compact in habit, and, weight of fruit considered, is the most productive variety known. The fruit is perfect in shape, being uniformly smooth and free from ridges, and is of a brilliant cardinal-red. Although fowness of seeds is a claim made for every new Tomato, it is a fact that by actual weight and measure tests **THE CARDINAL** has at least one-third less seed than the very best of the other varieties, and the thickness of pulp is most remarkable. It gives promise of being a good shipping sort, as ripe fruits picked in midsummer have kept in fine condition for ten days. The decided points of merit as described puts **THE CARDINAL** ahead of all other Tomatoes. Were it not so, there would be no need of adding another to the already large list of varieties.

Per pkt. of 30 seeds, 25 cents; 5 pkts., \$1.00.

KING HUMBERT.

A European novelty, recommended on account of its earliness, handsome form, and delicious flavor. The raiser describes it as follows: "Of the size and shape of a large plum, scarlet, very smooth and glossy, contains but few seeds, and in flavor closely resembles that of an apple of fine quality. None of the Tomatoes known to me equal in productiveness this fine sort, which is also one of the earliest, and will probably be found well adapted for northerly districts."

Per packet, 25 cents.

For further description of above and other Novelties, see our **HAND-BOOK FOR THE FARM AND GARDEN** for one year.

Purchasers ordering seeds to value of \$5.00 in one order, will be entitled to a copy of **THE AMERICAN GARDEN** for one year.

B. K. BLISS & SONS, 34 Barclay Street, New-York.

**SEEDS WORTH GROWING!
TWO NEW PEAS.**

Bearing until Frost.

Encouraged by the flattering and unprecedented success which **Bliss's American Wonder Pea** has met in all parts of the civilized globe, it affords us great pleasure to offer now **two other new varieties** by the same originator, the late Mr. CHARLES A. KNOLD, of Canada, which, we are confident, will be received with no less favor.

BLISS'S ABUNDANCE.

Half dwarf, 15 to 18 inches high; foliage large, thick, full, and dark green; pods 3 to 3½ inches long, roundish and well filled, containing six to eight large wrinkled peas of excellent quality.

It ripens second early, being fit for the table about one week after the earliest kinds. The most striking feature of this variety is its remarkable tendency for branching directly from the roots, forming a veritable bush. Many plants throw out six and more branches, each of which becomes literally covered with blossoms and pods in such abundance that the quantity produced by each branch would be considered a bountiful yield for an entire plant of many of the older varieties. In succession to the **American Wonder**, for home use or market, this variety presents more desirable points than any other we are acquainted with.

Sold in packets only, 25 cts. each; 5 pkts., \$1.00.

BLISS'S AMERICAN WONDER PEA.

Extra Early, Very Dwarf (8 to 10 inches), Requires no Bushing, Exquisite Flavor.

With the introduction of our now world-famed **AMERICAN WONDER**, the highest degree of earliness and productiveness, combined with excellence of quality, has been secured.

ABUNDANCE adds another link to the unceasing continuance of abundant and delicious supply through midsummer, while **EVERBEARING** extends the chain of the richest and most valued products of the garden and field through Summer and Autumn, thus furnishing an uninterrupted and never-failing supply from the earliest days of Summer till the relentless frosts and Winter snows lay low our plants and bid the gardener rest.

On account of the scarcity of seed of these **TWO NEW VARIETIES**, we shall not offer them in larger quantities than one-fifth pint packets, 25c. each, or 5 packets for \$1.00.

American Wonder. Per packet, 20c.; pint, 40c.; quart, 75c., by mail, post-paid. If by express, at expense of purchaser; pint, 30c.; quart, 50c.; peck, \$2.50.

Bliss's American Wonder.—After trial, in almost every section of the country, this Pea has proved very early, exceedingly productive, and in general good quality surpasses all other tall-growing early, yellow, smooth varieties. It continues in bearing several weeks, and grows from three to five feet high. Per pkt., 20 cents; pint, 45 cents; quart, 75 cents, by mail, post-paid.

One packet of each of the four varieties will be mailed to any address in the United States for 30 cents.

BLISS'S EVERBEARING PEA SINGLE PLANT DRAWN FROM LIFE Copyright 1883 by B. K. Bliss & Sons By Wm. C. Seranton

BLISS'S EVERBEARING.

The want of a reliable first-class Pea for Summer and Autumn use has long and seriously been felt by every one. With this new and remarkable variety, we are confident to place before the public a Pea which, when sufficiently known, will everywhere be recognized as the main dependence for a Summer and Autumn crop. Season late to very late; height of vines, 18 to 24 inches; foliage very large, firm, and bright green; pods 3 to 4 inches long on the average, six to eight peas in each pod, wrinkled as the preceding; quality unsurpassed in sweetness as well as flavor. We do not hesitate to say that, for continuance of bearing, this variety is unexcelled, if equalled, a characteristic which gives it especial value for late Summer and Autumn use. After repeated pickings, the vines continue to be covered with blossoms and buds, developing to maturity in turn until cut down by frost, making it practically as perpetual a bearer as can be found in the Pea tribe.

Sold in packets only, 25 cts. each; 5 pkts., \$1.00.

NEW EARLY RHUBARB—"PARAGON."

This variety, although now offered for the first time in this country, has had extensive trial in England, and has more than verified the claims made for it. It is unquestionably one of the finest varieties of Rhubarb ever offered, being the earliest of all and wonderfully prolific. The crowns and stalks are produced in such profusion that more than twice the weight can be gathered from "PARAGON" than from any other sort. It has also the qualification over all others that it NEVER SEEDS, a claim that we have tested and found well sustained last Summer. The leaves are remarkably small, while in color the stalks are a beautiful bright red, and in flavor unsurpassed. Price, strong plants, 75 cents each; \$7.50 per dozen.

New Varieties Potatoes.

Tremont, Mayflower, Iroquois, Charter Oak, Dakota Red.

Choice Varieties of 1883, etc.

Rosy Morn, Rubicund, Tyrian Purple, Early Sunrise, Rural Blush.

For description and price of the above, send for our Illustrated Potato Catalogue, 48 pages, which contains an illustrated list of the leading varieties in cultivation, with much useful information upon their culture. Mailed to all applicants inclosing 10 cents. Regular customers free.

(Mailed for 6 cents to cover postage.)

BLUEBERRY PLANTS.

The Blueberry is a very profitable fruit to grow for market. It succeeds on high as well as low ground and is an enormous bearer; will yield 100 bushels per acre under ordinary cultivation and bears abundantly the first season after setting out; they are perfectly hardy, never known to winter-kill in this latitude. I am very anxious to have the Blueberry introduced in all parts of the country, and will send 1 dozen plants by mail for 60 cents; 2 dozen, \$1.00; 100 by express, \$2.50. Address

Copyright, 1884, by F. R. Pierson.

THE BERMUDA EASTER LILY. We invite the attention of all lovers of choice flowers to this exceedingly valuable novelty. No collector's complete without it! This beautiful Lily has created a sensation wherever seen. It is the most valuable Lily ever introduced, as it blooms quicker, is more fragrant, never falls to bloom, and PRODUCES FROM 3 TO 4 TIMES AS MANY FLOWERS as any of the older sorts. WILL BLOOM TWICE IN ONE YEAR; in garden in summer, and in conservatory or house in winter. Commonly bearing 6 to 15 flowers, and one plant has borne 145 "A REMARKABLE FLORAL WONDER!" This, of course, is extraordinary, but serves to show the freedom with which it blooms. Its flowers are very large, trumpet-shaped, pure, snowy white, exceeding pure and delicate. We have been awarded **TWO FIRST PREMIUMS** exhibit of this Lily. The New York Times, speaking of one of these, which it styles a rich floral display, says: "Their pure white, fragrant and systematically formed flowers were as beautiful as anything nature has ever produced." Bulbs have until recently sold for \$1.42 and \$2 each, but as **WE ARE THE LARGEST GROWERS OF THIS VALUABLE NEW LILY IN THE WORLD,** and having hundreds of thousands of bulbs for sale have determined to place it within the reach of all. Look! We offer one bulb for 40c., 3 bulbs for \$1.00, or 12 bulbs for \$3.25 bulbs for only \$3.00 for \$2.00 for 12. Sent postage paid to any address in the U. S. without extra charge; also, **LILIAM AURATUM, THE GOLDEN BANDED LILY OF JAPAN.** If a flower ever merited the name of gloriolita it is this; flowers 10 to 12 inches across; delightfully fragrant, of exquisite coloring, ivory like petals, thickly studded with rich chocolate—emerald spots, with a bright golden band through the centre of each petal. Not now like our Bermuda Easter Lily, but a fitting companion. We OFFER 1 bulb for 40c., 3 bulbs for \$1.00, or 12 bulbs for \$3.00. Also the **MOON FLOWER,** or **Evening Glory;** flowers immense, pure white, sweet scented, blooms very profusely, and as they open only at night, are very curious; the effect on a moonlight night is charming; unequalled as a summer chandelier. Cannot fail to please; each, 40 cts.; 3 for \$1. **ORDER AT ONCE!** Our large illustrated catalogue, with full description of the above, notices of the press, etc., with two colored plates, sent free to all. Contains complete lists of all the *Best New Plants;* many valuable novelties. Wholesale sale rates to large buyers. Send money by P. O. Order, or in Registered Letter. Show this offer to your friends, and get them to order with you. Address, mentioning this paper,

CORN-GROWING IN CONNECTICUT WITH THE MAPES MANURES.

[From the Connecticut Farmer, February 9th, 1884.]

The following is an accurate account of the crop of corn raised the past summer on 16 acres of land, on the farm of Mr. G. P. Brinloy, Newington. Eleven acres of this field was in corn the year previous, and the only manure used was the Mapes' Corn Manure. Adjoining was five acres in orchard, which had become worthless in consequence of the ravages of the canker-worm. The apple-trees were grubbed up, the land plowed and planted with corn, along with the eleven acres in corn the year previous. Below are the expenses of raising and harvesting said crop of 2038 bushels of ears of corn:

Plowing 16 acres.....	\$32.50	Replanting.....	\$3.00
Harrowing 11 acres twice with Thomas Smoothing Harrow.....	10.50	3 1/2 bushels seed corn at 80c.....	2.80
Harrowing 5 acres twice with Wheel Harrow.....	1.50	Prout's horse-hoe, man and team, 3 days.....	8.50
Harrowing 5 acres with Smoothing Harrow.....	2.50	Prout's horse-hoe, man and team, 3 days.....	9.00
Rolling 5 acres with Smoothing Harrow.....	9.00	Prout's horse-hoe, man and team, 3 days.....	6.00
Marking both ways, man and team, 3 days.....	290.00	5 acres plowed twice, one-horse corn plow.....	122.00
Fertilizer, Mapes' Corn Manure.....	12.00	Husking 2038 bushels corn at 6c.....	20.38
Applying ditto.....	9.40	Hauling home ditto, 1c. per bushel.....	30.00
Planting.....		Cutting and stacking.....	
			\$582.36
			256.00
			\$326.36

Estimate of corn-stalks, 32 tons, at \$8. Cr..... \$320.36
 Making cost of crop.....
 There were 362 bushels nubbins and soft corn, which, deducted from 2038 bushels, leaves 1676 bushels of ears of good, sound corn, of which 2 bushels shelled yielded 59 pounds corn, which gives 891 bushels and 29 pounds corn, and makes the cost price a trifle over 36 cents per bushel. Allowing the 362 bushels of nubbins and soft corn to be worth 12 1/2 cents per bushel for feed, which will come to \$45.25, reduces the cost price of crop to a little less than 31 1/2 cents per bushel. This crop never had a hoe in it, and there were not as many weeds in the field at the time the corn was cut as would have filled the box of a business wagon.

Send postal for forthcoming pamphlet, containing reports from practical, well-known TRUCK, FRUIT, AND SPECIAL CROP GROWERS. Many of those growers use twenty tons and upward of the Mapes Manures in a season. Address

We do not from 60 to 90 CLUB ORDERS, besides sending out PLATED CASTERS as Premiums with day. SILVER-DECORATED TEA SETS with \$10 orders. GOLD BAND or MOSS ROSE SETS with \$15. GOLD BAND SETS, of 106 pcs., with \$20 orders, and in this Paper, and we will send you full Price and mention List. Freight Charges average 75 cents per 100 lbs., to points West. GREAT LONDON TEA CO., 805 Washington Street, Boston.

"ACME" PULVERIZING HARROW, Clod Crusher, and Leveler.

AGENTS WANTED. It is the best selling tool on earth.

The "ACME" subjects the soil to the action of a Steel Crusher and Leveler, and to the Cutting, Lifting, Turning process of double gangs of CAST-STEEL COULTERS, the peculiar shape and arrangement of which give immense cutting power. Thus the three operations of crushing lumps, leveling off the ground, and thoroughly pulverizing the soil are performed at the same time. The entire absence of Spikes or Spring Teeth avoids pulling up rubbish. It is especially adapted to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that cuts over the entire surface of the ground.

We make a variety of Sizes working from 4 to 15 Feet Wide.

DO NOT BE DECEIVED. Don't let your dealer palm off a base imitation or some inferior tool on you under the assurance that it is something better, but **SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL.** We will send the double gang Acme to any responsible farmer in the United States on trial, and if it does not suit you may send it back, we paying return freight charges. We don't ask for pay until you have tried it on your own farm.

Send for Pamphlet containing Thousands of Testimonials, from 46 different States and Territories.

The American Garden

A Monthly Journal of Practical Gardening.

Dr. F. M. HEXAMER, Editor.

B. K. BLISS & SONS, Publishers.

Vol. V.

NEW-YORK, APRIL, 1884.

No. 4.

CONTROVERSIES.

An esteemed friend objects to a statement made by one of our correspondents, and in defense of his own position sends a very long article. This we must respectfully decline to publish, not because we believe his statements less trustworthy and reliable than these of our correspondent, but because we consider the space of our pages too valuable to fill it with discussions and disputes about matters involving so great a diversity of opinion, that even those who have made a life-long study of the subjects cannot agree.

We held that the chief object of a horticultural journal is not so much the giving of minute prescriptions for the performance of the different gardening operations and for infallible remedies for all the ills vegetable life is heir to, as to induce observation and experimenting, to stimulate thought and study, and to develop sound, clear judgment, capable to draw correct and logical conclusions. To the furtherance of this aim nothing is more detrimental than petty disputes and quarrels about diverging opinions.

The extent of our country, its diversity of soil and climate, in localities of apparent equality, even, are so great that similar or like methods may produce widely different results, and consequently lead to dissimilar conclusions. In gardening, as in politics and religion; there is an unlimited field for thought, and although persons may hold directly opposite opinions about doctrines

and methods, they may be equally honest and earnest in their convictions.

We do not have the least desire to force our individual opinions upon our readers,

agree with his opinions in every particular. It would be a monotonous paper indeed that should represent one man's views only.

So far as our own opinions and convictions

are concerned we give them to our readers in our own way, for what they are worth, and if others do not agree with us we shall always be glad to have them express their reasons, if based upon tangible evidence; but we have neither inclination nor disposition to devote our columns to the discussion of theoretical and disputed points which are of no interest to the general reader.

IN SPRING.

WRITTEN FOR THE AMERICAN GARDEN.

Come out with me this April day,
And hear what spring will sing and say.
On such a balmy day as this
Forget what care and sorrow is;
Forget the winter and its snow,
And think of fragrant flowers that blow
Above dead leaves to typify
The soul that lives and cannot die.

See, here's a blossom at our feet,
A little thing, but oh, how sweet!
Each fragile petal holds a hint
Of Heaven in its dainty tint.
With sunshine at its heart. And see,
It has a lover in the bee,
Who comes with pollen-dusted thigh,
To visit it as he goes by.

Hark! hear the bluebird! See his wings
Beat out the measure, as he sings,
Of his sweet song, and somewhere near
A robin's cheery chirp I hear.
The brook sings softly, as it flows
Past banks whereon the Willow grows,
And every branch and twig to-day
Becomes a prophecy of May.

How tenderly the April sky
Leans down to earth. The winds go by
With balm of healing on their wings.
Oh, heart, be glad, with all glad things.
Forget the winter that is past,—
The dream of spring is here at last.
Some spring, please God, in Heaven's sweet
weather.

Our hearts will all grow glad together.

EBEN E. KENFORD.

CHEERING WORDS.

"I am delighted with THE AMERICAN GARDEN in its new form and dress. With the enterprise of its publishers and the great ability of its editor, it is sure to become more and more popular. It stands in the front rank among the first of similar publications of our day. It merits success, and it cannot have more than I desire."

MARSHALL P. WILDER, *Pres. Am. Pomological Soc.*

Every one says THE AMERICAN GARDEN is a splendid paper, and I think it should find a place on the table of every one who has a farm or garden. It is worth many times its cost.—E. W. S., *Carbon Co., Wyo. Ter.*

much less to exclude or remodel statements of others because they come in conflict with our own views, unless we know them to be erroneous. Yet the fact that we publish an article over the name of a correspondent should not be taken as evidence that we

THE AMERICAN GARDEN is brighter than any horticultural or agricultural publication I know. Indeed, its pages are as clean, clear, and handsome as first-class paper, types, press, and a first-class pressman can make them—a model in its way. All success to THE AMERICAN GARDEN!—L. S. A., *Falls Church, Va.*

The Vegetable Garden.

SEASONABLE HINTS.

With the professional gardener the question of actual profit is of first importance in all his investments; in the home garden, however, there are many considerations to be taken into account beyond and above a money return. "I can buy my vegetables cheaper than I can raise them," is a remark sometimes made by those not inclined to give the necessary care to their gardens, and no doubt, in many cases, past experiences justify the assertion.

Cultivating too much ground is one of the most frequent causes of unsatisfactory and unprofitable gardening and farming, and the beginner especially cannot be warned too strongly against undertaking more than he is sure to be able to take care of in the best possible manner. A small piece of ground thoroughly prepared, liberally enriched, and carefully cultivated, will often produce many times more than an area ten times as large, but tilled indifferently.

The Quality of Vegetables depends largely upon the fertility and conditions of the soil, and the attention given to the growing plants. Choice of varieties and excellence of seeds cannot counterbalance lack of fertility and cultivation.

Fertilizers.—Well-decomposed stable manure should always form the main reliance in the garden; it should be plowed under lightly and well mixed with the soil. Nevertheless, concentrated or chemical fertilizers may frequently be used to great advantage, either alone or in connection with animal manures. In our own experience, we have invariably derived most benefit from the latter method. Concentrated fertilizers should always be applied broadcast, harrowed in, and given in successive doses, so as to keep up a steady supply of plant food throughout the growing season.

Peas are among the earliest crops entrusted to the soil. In planting early Peas it should be borne in mind that the wrinkled sorts, although best in quality, are more tender than the round ones. For first plantings in cold, tenacious soils, the latter are therefore to be preferred. In warm, dry soils, however, there is little danger of rotting with the wrinkled kinds,—the *American Wonder* especially, which is the hardiest of this class,—provided the seed is not covered too deep. With all the earliest planted Peas it is advisable not to cover deeper than three inches; it is little trouble to make up this deficiency by hilling up after the vines appear above ground.

To insure a succession, early, medium and late varieties should be planted at the same time, repeating the sowings every two weeks until August.

Hot-beds made last month need frequent attention as the sun becomes more powerful. The sashes should be lifted as soon as the sun strikes them, and an hour afterward be removed altogether. Water only when the soil becomes dry, and then water thoroughly, so as to soak the entire mass of soil. In the afternoon, half an hour before the sun leaves the bed, replace the sashes, and when cold nights threaten, protect with matting, carpets or boards.

DANDELION CULTURE.

It is but a few years since the cultivation of this vegetable was undertaken, but it is making friends so rapidly that, although the amount grown annually is already very large, the supply is not equal to the demand. It is used principally as a salad, and as such it occupies a place of its own, being different in taste from anything else.

The main point in its successful cultivation is to have it in market early in the season. To meet this early demand, it is grown on benches in the greenhouse, using all available means to bring it to a marketable state as early in January as possible. From this time till the first of May, when outdoor-grown plants and other greens be-

IMPROVED DANDELION.
(One-fifth natural size.)

come marketable, there is a steady demand for forced Dandelion.

The seed of the Broad-leaved, or Improved Dandelion, which is the variety principally grown, is planted in rich soil, in rows one foot apart, as early in the spring as the ground will permit. The plants, as soon as large enough, are hoed and tended—not thinned—and kept free of weeds all the season. About the first of September the tops are hoed off lightly, after which the roots throw up a few green leaves, sufficient to mark the rows. Just before the ground freezes the roots are plowed out, taken up, and brought to a pit, or "winter house," where they are stored by setting them thickly in the ground as they grow in the field. The

BROAD LEAVED DANDELION.
(One-fifth natural size.)

temperature here rarely above 60°, and sometimes the ground freezes around the roots; there is sufficient light to green the tops a little.

From here they are transferred to the benches of the greenhouse, in quantities as required. I set out some every week, so as to keep the supply constant and uniform. After planting in the benches they grow rapidly, and are ready to harvest in four weeks from the setting. They are placed in rows five inches apart, and about as thick as they will stand in the row. The soil is mixed with plenty of fine horse manure, and a liberal dressing of wood ashes in addition.

When ready for use, the plants are in full bud, with leaves six or seven inches long. They are prepared for market by pulling up the roots, cutting them off, and picking off all dead leaves; tying them in bunches weighing eight ounces; and, finally, washing them. By this plan they are handled without loss or shrinkage.

The usual price is one dollar per dozen bunches; and, as I have never been able to raise enough, I am contemplating the building of a separate house for raising Dandelions on a larger scale. A space 3x6 feet will yield one dollar and a half every month for four months, varying somewhat according to the size of the roots, for the larger these are the heavier will be the tops. The same roots cannot be used a second time; a new stock has therefore to be raised from seed every year.

W. H. BULL.

MAKING A NEW GARDEN.

On farms where the land required for a garden spot is generally of comparatively little value, better and more satisfactory results would frequently be obtained by preparing a new plot. In this case, the proper working and mixing of sufficient quantities of fertilizers with the soil is of the greatest importance.

Well-rotted stable manure, free from grass and weed seeds, is best. The amount of benefit derived from fresh manure applied to a new garden cannot be very great during the first season. This should have been spread in the fall to obtain best results, but if not, the sooner it is done in spring the better. As soon as the ground is dry enough it should be well harrowed, and the manure plowed under. Another dressing of manure should be given then, and again plowed under. This is far better and more effective than to apply the entire quantity of manure at one time.

If you have a supply of poultry droppings, this should be worked in where Peppers, Onions, or Cabbages are planted, as it is difficult to get the soil too rich for these plants. Ashes are especially valuable for Onions and Salsify.

Rotten chips or sawdust are good for Lettuce and Radishes, and if a top-dressing is given where these are to be sown, a decided improvement in the crop will follow. Night soil can be utilized to good advantage by applying it between the rows and hoeing in.

I obtained good cuttings of Asparagus the second year from seed, by giving the bed a dressing of unleached ashes, working in well; then a good application of stable manure very early in the spring, well worked in, and a liberal quantity of night soil worked in the ground between the rows. In using either poultry manure or night soil, they should be worked in around the roots of growing plants, or be applied and worked well into the soil before sowing the seed. They are very strong fertilizers, and should not be allowed to come in direct contact with seeds or plants.

It is, of course, not as easy to obtain the very best results from entirely new ground as from land that has had more thorough cultivation; but by availing oneself of all these means, which may be had on most farms, satisfactory crops may be raised even the first year.

N. J. SHEPHERD.

NEW POTATOES.

Prominent among the new Potatoes introduced this season are the varieties here named. All were awarded first-class certificates of merit by the Royal Horticultural Society of London.

TREMONT.

A good medium-sized white Potato of oval shape, slightly flattened, with very smooth skin, and few small, flat eyes. Flesh finely grainod, of snowy whiteness, and of excellent table quality. Its yield is large, and its ripening season a few days later than Early Rose. Those who have tried it consider it a most valuable addition to the list of first-class early Potatoes for family use. This and the following variety are seedlings produced by crossing Silverskin with Early Rose.

IROQUOIS.

Ripens medium early, is of medium to large size, irregularly round shape, yellowish-white color, sometimes russety; eyes few and small. In quality it stands in the first rank, cooking through quickly and completely, without leaving a hard core—the common fault of most round Potatoes. When cooked it is dry, mealy, and of best quality. It yields well, and keeps in prime condition through winter and spring.

CHARTER OAK.

This is a cross between the "Old Loug Pinkeyo" and "Rand's New Poachblow," and is remarkable for its exceedingly handsome appearance, great yield, and extraordinary keeping quality. It is large, irregularly oval, flattened; skin white and smooth; eyes bright pink; quality first class. Vines large, vigorous, and healthy. This variety combines in an unusual degree the qualities most desirable in a market Potato for late keeping, and as such it promises to take a leading position as soon as more extensively known.

SOME POINTS IN POTATO RAISING.

I do not think it advisable to say, that soil or this soil is best for Potatoes. What is the best soil in one locality is not the best in another. It is generally said that the soil best adapted to Potatoes is a sandy loam. In my locality such a soil is best for early Potatoes, but the summer drought makes it too dry for late Potatoes. I missed a good crop of late Potatoes for a couple of years on account of drought, and in response to an

inquiry an Ohio market-gardener, who was very successful in raising Potatoes, wrote me to plant them on a soil containing a fair percentage of clay. I did so, and raised good Potatoes. In most localities a light sandy loam is best for early Potatoes, because it dries and heats earlier in the spring and is always friable, and the August drought does not catch the early Potatoes.

In my opinion the day for raising early

TREMONT.

Potatoes on land not under-drained, is past. It is always the first Potatoes in the market that bring the big prices, and if you do not under-drain the land you will rarely be first nowadays. Draining gives you a great advantage, as the ground is fit for the Potatoes much earlier in the spring, and there is less danger of frost after planting. I am inclined to think that mulching would remedy drought on sandy land, judging from the experience of others.

CHARTER OAK.

The soil has something to do with the quality of the Potato. On heavy, wet soils the tubers are apt to be watery and insipid; on a light, sandy soil they are more mealy. A rich new soil yields Potatoes of better flavor than an old soil. But the man who raises Potatoes for market is not apt to care for the flavor. Buyers purchase from the appearance of the outside.

I think so much of ashes as a fertilizer for the orchard that I rarely have any for the Potatoes; but unleached ashes are a splendid fertilizer for Potatoes. I have seen good results always from the application of lime to soils not rich in it. The same is true of bone-dust. Southern Potato raisers have a good and convenient fertilizer—Cottonseed meal. Fresh barn-yard manures are apt to make a large growth of tops at the expense of the tubers; but I have raised number one crops of early Potatoes on a lot upon which cattle had been fed for several years.

One advantage of a sandy soil is that it almost insures Potatoes of a smooth, good form. Such a soil never gets so hard as to distort the Potatoes. It is different with a heavy clay soil. This should be kept as loose as possible. Whether or not hard ground affects the size of the Potatoes, I am not prepared to say; but I have sometimes thought it did. Surely it would if it diminished the amount of available plant food.

I believe in hilling Potatoes, but I hill them downward; that is, I plant them deep. Potatoes must have a good depth of soil, and must either be planted deep or hilled. I consider deep planting preferable to hilling above-ground.

Deep planting requires a deep soil and deep cultivation. I believe that the soil for Potatoes should be stirred a foot deep—but never subsoiled. This brings us to another advantage of under-draining—it not only dries and looses, but also deepens the soil.

I think it makes very little difference whether large or small Potatoes are used for seed, or whether the seed is cut or not. The tuber we plant is not a seed, but an enlargement of an underground stem. Hence, when we plant Potatoes we do not plant seeds, but *layer a stem*. The tuber is plant food, and the more plant food for the young plant the better. But you are not sure of giving it this by planting a large tuber, for more eyes will grow in a large than in a small one. However, I have had slightly the best results from planting large tubers, cutting them in only three or four pieces.

JOHN M. STAHL.

SPINACH.

Spinach seed must be sown at the earliest moment the condition of the soil permits, as, if deferred, the leaves are liable to become injured by the maggots, which infest the plants in summer.

The Fruit Garden.

SEASONABLE HINTS.

Whatever individual preferences there may exist as to the best season for planting fruit trees and small fruit plants, no one can go far from right by planting as early in spring as the ground becomes dry enough for bringing it into a mellow, friable condition.

Young Trees are now preferred for transplanting, by all experienced orchardists, as it is an undisputed fact that the success with trees depends far more upon their healthy and vigorous condition than their age at the time of planting.

"For Immediate Bearing."—This suffix to trees and plants, enumerated in nursery catalogues, offers a most alluring temptation to beginners in fruit culture, which, when yielded to, is sure to prove but a "delusion and a snare." A moment's consideration will convince any one of a logical mind of the impossibility of the thing.

A plant is a living organism, governed by as immutable laws as we are ourselves. The roots of a tree extend about as far from the stem as the tree is high; that is, the roots of a tree ten feet in height would penetrate a circle of twenty feet in diameter. In taking up such a tree the greater part of its roots—especially the fine fibrous-feeding roots—have to be cut off, and the top of the tree in proportion, if we would have the slightest chance to make it live at all. It will be readily seen, therefore, that it requires some time before the tree can regain its former size in roots and branches, and that all its vitality will have to be spent for this purpose; and if a few abortive fruits should form, these will only be an additional tax, tapping the life-blood of the tree, to more speedily effect its ruin.

With *Raspberries* and *Blackberries* the fallacy of "plants for immediate bearing" is still more apparent. These bear fruit only on canes of the previous year's growth, which, in transplanting, have to be cut off, if the success of the plant is desired. The young shoots which will spring up from the roots during the season will bear fruit next year, and no power on earth can make them do so sooner.

To have fruits in the shortest possible time there is no surer way than to plant now, young, thrifty trees and vigorous plants, give them the best care and cultivation, and await the results. Let no one delude himself that he can make up for lost time by planting larger trees next year. You might as reasonably expect to make up for lost time in missing a railroad train, by trying to overtake it with a stage-coach. To be sure, you may send a telegram to your friends, informing them that you were "left"; and so you may buy your fruits in the market, and imagine you had picked them from your own vines and trees, but all the impatience in the world will not help you one dot.

Therefore, plant now!

Strawberries in solid beds or matted rows will have to be cleared of all mulch, but when growing in hills, the mulching material should only be pushed aside so as to allow the plants to grow through it, while the mulch is to remain around the plants until after bearing, to keep the ground moist and the berries clean.

PREPARING GROUND FOR GRAPE-VINES.

Few plants bear as much abuse as Grape-vines. They will grow and not seldom bear fruit, even under most unfavorable conditions; yet, to do their best, they require care and proper food as much as a man. The extent of ground which the roots of a vine occupy varies considerably according to the degree of available plant-food in the soil, and by placing the fertilizing material near the surface, the roots will rarely penetrate deeper than twelve to fifteen inches.

The most available form of plant-food for Grape-vines is pure bone of various degrees of fineness, from whole bones to that of bone-flour,—the whole bone furnishing a supply of food for years. Well decomposed cow-manure is the best kind of fertilizer to be used. Any other well-rotted manure will do, if this is not at hand. One of the maxims of success in fruit-culture may be said to be, "Never use fresh manure to incorporate in the soil for the production of the best fruit." It may be used as a mulch, provided it does not come in contact with the roots.

The ground where the vines are to be planted having been selected and marked off, if the best results are wished, spade or fork two blades deep. Throw the dirt out. Now pave the bottom with large bones, which can be purchased at any butcher-shop. Incorporate into the soil at the side of the trench or hole ten pounds of coarse bone-dust, and from two to three wheel-barrows of the rotted manure to each vine intended to be planted, and replace the soil. In setting the vine, place a thin layer—say an inch in thickness—of ordinary garden soil around each root of the vine.

Of course, good results may sometimes be obtained by less thorough preparation; but with delicate varieties, and when permanent and best success is desired, it pays to take extra pains in preparing the soil.

J. B. ROGERS.

A MONSTROUS GRAPE-VINE.

The oldest, and what is believed the largest, Grape-vine within New South Wales, states an Australian paper, may be seen in the yard of the General Bourke Hotel, Paramatta. The circumference of its stem in the thickest part is eighteen inches. The lattice-work, which it covers, has been built after the fashion of a large summer-house, measuring thirty-five feet by thirty feet, with a height of fourteen feet. The vine, which completely invests the whole structure, is, at the present season of the year (January), draped in rich, luxuriant foliage, amid which are to be seen the luscious fruit hanging in hundreds of magnificent bunches. One bunch, a very large one, which was weighed in my presence, burned the scale at nineteen pounds. At this spectacle one's mind is instinctively reverted to the story which is told in the good old book of the two Israelites, who, between them, carried on a stick a bunch of grapes, because it was too heavy to be borne by one of them alone. It was in the year 1835 that this vine was planted, so that it must now be nearly fifty years old.

Our correspondent, Mr. A. A. Duncleiff, of Burnswang, through whose kindness this information was received, adds:

"Probably it may excite doubts in the minds of your readers, but in many localities here, under judicious culture, both bunches

and berries grow to a wonderful size; single berries being frequently as large as good-sized pullet eggs, and not thought uncommon."

WOOD ASHES FOR ORCHARDS.

For orchards, says Dr. R. C. Kedzie, in the *New-York Tribune*, I regard ashes as worth more than six times the value of barnyard manure, ton for ton. When barnyard manure is composted with wood ashes, the coarse vegetable material and litter are rapidly broken down, and the manure is speedily fitted for use; there is some loss of nitrogen in the form of ammonia, but there will be no loss of mineral matter if kept from leaching by water.

Wood ashes represent all the mineral elements of vegetable growth, and contain everything the farmer must give his crops except combined nitrogen. Wood ashes will vary in composition and value with the kind of wood and the part of the tree. I will take the ash of the body-wood of the Beech-tree as representing the average of wood ashes. A ton of such ashes contains 320 pounds of potash, worth \$16, and 105 pounds of phosphoric acid (insoluble), worth \$5.25. Omitting all the other ash constituents, which have some value of themselves, the potash and phosphoric acid of a ton of such ashes are worth \$21.25, or nearly six times the value of a ton of fresh horse-dung.

PLANT SMALL TREES.

At this season of tree-planting, the following points in favor of small trees, as given by Mr. F. K. Phoenix, deserve the careful attention of planters:

"Small trees have larger roots in proportion; (2) they cost less; (3) expressage or freight is less—expressing small trees is usually cheaper than freighting large ones, and then so much more speedy; (4) less labor handling, digging holes, etc.; (5) less exposed to high winds, which loosen roots and kill many transplanted trees; (6) planters can form heads and train them to their own liking; (7) with good care in, say, five years, they will overtake the common, larger sized trees. Without good care, better not plant any size."

SUCCESSFUL RASPBERRY GROWING.

To grow Raspberries successfully, says Mr. N. Ohmer, President of the Ohio State Horticultural Society, you must select good soil, well under-drained; let it be clay loam or sandy soil, but prefer upland clay loam. I have known them to do admirably in almost any soil, provided it is rich and not wet. Plow as you would for any other crop, the deeper the better, if your soil admits of it. Harrow well; plow out furrows six or seven feet apart, and plant in said rows three feet apart; a partial shade I find to advantage. My patches that do best are in an old orchard.

FLORIDA'S STAPLE CROPS.

B. F. Chynton, editor of the *Wine and Fruit Grower*, thinks that while Grapes may be moderately successful here, the fact remains that the great staple will be Oranges, Lemons, and Pine-apples. Small fruits, except Strawberries, will not be among the "big things" in this State.

THE MRS. GARFIELD STRAWBERRY.

One of the most vigorous growing plants in our Strawberry trial-beds is this new variety. The plants were received too late last spring to perfect any berries; yet, to judge from the results under so adverse conditions, we were very favorably impressed with its desirable qualities.

It is a seedling of the Crescent, raised by Mr. Matthew Crawford, of Ohio, and is now introduced by Hale Brothers, of South Glastonbury, Conn., who describe it as follows:

"Growth of plant healthy and vigorous, resembling its parent, the Crescent, with broader foliage, however, and not making more than one-fourth as many runners; leaves clear and bright, standing drought and frost without injury; flowers perfect, with abundant, well developed stamens; fruit stalks of medium length, stout, and usually branching. Very prolific, equal

to the Crescent in quantity of fruit per acre; and while not setting quite as many berries as that variety, they average much larger and hold their size better to the end of the season. Form conical, with slight neck; color, glossy bright scarlet. Its flavor is rich, sweet, and delicious; and while not equal to the Wilson in shipping and keeping qualities, it is much firmer than any other of the very productive sorts."

PEACH CULTURE IN NEW ENGLAND.

At a recent meeting of the Massachusetts Horticultural Society, for discussion, the subject was "Peaches; their Cultivation and Varieties, and the Treatment of their Diseases." John B. Moore had been appointed to open the discussion, and said that the Peach was introduced from Persia, which corresponds in latitude to the Carolinas and Georgia. Being a native of a more southern climate than ours, it is hardly at home here, unless by a long course of acclimation it has become suited to our climate. It is one of the finest of fruits, and we all desire to grow it, and the question is how we shall do so.

The first thing is to select a suitable location, which should be on high grounds, at least partially protected from cold winds, and with a warm soil, where the wood will finish its growth and ripen early. Even there a crop cannot be expected more than two or three times in five years. The speaker had seen on a hill slope the line of destruction of fruit buds so plainly marked that twenty feet below a certain point the buds were all killed, and twenty feet above they were all good, showing the benefit of high ground.

If the land is in condition to grow thirty

or forty bushels of Corn per acre, it is rich enough. If it is made rich enough for Peaches, it will be too rich for Peaches. When there is a large crop of fruit set on the trees, manure may be applied freely to carry it out. Trees of one year's growth from the bud are best to plant. Natural trees are not more hardy than budded. The best trees are those grown four or five feet high and with sufficient room to branch.

When planted, every side limb should be cut off. They will die if they are not cut off. Plant carefully sixteen to eighteen feet apart. It has been the custom to plant closer, but then it is inconvenient to cultivate with a horse, and also to get out the crop, and the shade below is so dense that no good fruit is produced except on the tops of the trees. More room and air give better fruit, and one bushel of good fruit is worth two of poor. He does not believe in allow-

branches, but only the leading ones. A year afterward pursue the same course. This will make the trunk larger, and the limbs stronger where they join it, than they would otherwise be; and, the limbs being shorter, the weight of fruit will have less leverage, and they will hang nearly to the ground without needing a prop to keep them from breaking. The small shoots should not be shortened.

The fruit must be thinned when the crop is set. The speaker never saw a workman with courage enough to thin sufficiently. A good rule is to pick off as many as you think ought to be, and then to take off half the remainder, and never have two together. The time to thin is when the fruit is as large as a Walnut, before the stem has hardened. The exhaustion of the tree is from the formation of seed and not of pulp. It is a good deal of work to thin the fruit properly, but

if the trees are pruned as directed, half of it can be done while standing on the ground, and one bushel of fruit well thinned is worth three not thinned.

Stable manure should not be used; bone is undoubtedly one of the best fertilizers. The experiments of Professors Goessmann and Penhallow are of importance, apparently showing that trees once diseased with the yellows have been restored to health by the application of muriate of potash, but the speaker has not himself succeeded. Muriate of potash is undoubtedly useful as a fertilizer, and he would use it on a young orchard. The yellows is the worst drawback on the cul-

tivation of the Peach. The only insect that is troublesome is the worm which works under the bark, and this can be kept down by putting a little mound of ashes or lime around the trunk of the tree.

In regard to varieties there is nothing new that is particularly desirable. Crawford's Early is the best kind for market, and Mr. Moore advised to plant mainly this variety, with a few Crawford's Late.

PHYLLOXERA IN FRANCE.

The *Gardeners' Monthly* states that the French have about abandoned all effort to preserve their vines through insecticides. The use of the American stock is found to be the simplest protection. In the first year an American cutting is planted; in the second this is used as a stock; in the third the cion bears fruit. Care must be exercised in selecting stock suitable for particular districts, for the variety that is fitting in one place is not so in another.

THE MRS. GARFIELD STRAWBERRY.

ing Peach-trees to branch down to the ground; after trimming off the side branches at the time of planting, so that only a bare rod is left, the heads down to a uniform height of four feet by measure. The vigorous shoots will come from the upper part, and will often make a growth of two feet in length. The weak lower shoots should be cut off during the summer, but only gradually, for the tree must have leaves to enable it to make roots.

The land must not be allowed to run to weeds or grass, but should be cultivated in some hoed crop that will not exhaust the soil. Do not crowd a Potato hill or anything else too close to the young trees; be satisfied if the crop pays the expense of cultivation and keeps the soil mellow and in good condition to absorb the rain.

The next spring, after planting, cut out all the branches but four or five of the best, and shorten these back two-thirds; always cutting to an outside bud, which will give a more spreading tree. Never cut the small

The Flower Garden.

APRIL.

Aloft where bonds the tall Elm's topmost crest,
Watching the sun, the robin sits and swings;
The amber light shines on his ruddy breast,
And loud his carol rings.

The Crocus-buds break into starry bloom,
And in the wind the golden Tully rocks,
And garrulous sparrows chatter in the gloom
Of prim and rounded box.

The meadows stretching from the river show
The fresh, cool green of early spring grass,
And bending Willows droop their branches low
As winds above them pass.

A shimmering haze lies on the dreamy slopes
Of hills that rise against the lustrous West,
The waveless sea secus bright with dawning
hopes
Of summer's peace and rest.

The south wind, singing through the pasture,
bends
The Fern's low frond, crowning a mossy plinth;
And Violet perfume in the garden blends
With sweets of Hyacinth.

The mellow sunlight, breaking through the rifts,
Burns like a flame along the widening plain,
And down the sloping valley slowly drifts
The murmur of the rain.

The yellow Cowslips toss their cups of gold,
Where brooks go whispering through the reedy
marsh;
And crows, among the blooming Maples hold
A council loud and harsh.

The plowman, whistling down the furrow, sees,
Above the thin and opal-tinted mist,
The rounded cones of budding orchard-trees,
Where bluebirds make their tryst.

The massive monarchs of the forest now
Are giant harps, melodious with song
That vibrates through each quaintly twisted
bough,
Swaying the hills along.

The fragrant morn, clad in soft robes of white,
Flings wide day's portal for the sunlit noon;
And deep the purple stillness of the night
Clings round the narrow moon.

And fair with blooms, and buds that tell of these,
Through merry songs across the valleys blown,
Fresh from the sweetness of south-lying seas,
Comes April to her own.

—Century.

SEASONABLE HINTS.

Arrangement of Flower-beds.—In making plans for the planting and arrangement of prospective flower-beds, it is well to bear in mind that too much sameness and uniformity in design, as well as in the material employed, becomes monotonous and tedious. No matter how pretty and becoming a certain dress may be, no one would like to wear it all the time, even at the risk of changing it for one less handsome and comely. "Variety is the spice of life" in flower-beds as well as in many other things.

In *Small Places*, especially, it becomes desirable to produce as much diversity in colors, forms, and character of plants as possible. Each bed should have a certain individuality of its own, which is easily imparted by using only one kind of plants in each bed, or by making one color predominant. This will not only make the grounds appear much larger, but it produces a pleasing and refreshing effect, not obtainable when the same kinds of plants and colors are used in all beds alike, and are planted in the same beds year after year.

HARDY PERENNIALS FROM SEED.

The following list includes good, common, ornamental perennials, easily raised from seeds; indeed, I have raised them all, over and over again. But it does not at all exhaust the list of plants that may readily be increased in this way. All these plants have not good general English names; hence I have used the botanical ones, but on referring to the catalogues of prominent seedsmen you will find most of them included described.

Alyssum saxatile, close matted growth, blooms second year, bright yellow flowers in spring. Raise a few every year.

Anemone coronaria sown in spring will bear a few blooms in late summer and fall, and a full crop next spring. Muleh in winter.

Aquilegia (Columbine) *glandulosa*, *Olympica*, *chrysantha*, *Sibirica*, and *truncata*, are very fine, and choicer than any of their hybrid progeny.

Aimera (Thrift), all shades of pink. Blooms in spring and early summer. Neat bunch habit. Good for edgings. Likes moist, open, sunny places.

Aubrietia. A matted rock-plant, does finely in border. Flowers purple, in early spring. Do not cover in winter.

Bellis (Double Daisies) come readily from seed. Grow in a moist, sheltered, and faintly shaded place. Cover with some dry leaves, and an old box in winter.

Callirhoe involucrata. Bright crimson flowers, all summer. Of straggling, spreading habit from a big Turuip-like root.

Campanula (Bell flowers). The Carpathian, blue and white; the Peach-leaved, blue and white; also, *alliariaefolia*, *celtidifolia*, *glomerata*, *macrantha*, *punctata*, and *turbinata* are good, easy-to-grow sorts.

Coronilla varia. Lilac-purple, very profuse; all summer. Spreads considerably by underground shoots. Will grow anywhere.

Delphinium (Larkspur). Lemoin's garden hybrids, all shades of blue, are unsurpassed. Summer, and the second growth in fall. The scarlet ones, as *nudicaule* and *cardinale*, thrive well in cold frames, and occasionally in light, sandy, sunny places in the garden, but as common garden plants they are uncertain.

Dianthus (Pinks). We have sweet, garden, grass, fringed, and other Pinks, single and double. Carnations are barely hardy.

Dracocephalum Ruyschianum Japonicum. Large, showy, violet-blue.

Echinacea purpurea. Three to four feet high, showy rose-purple cone flowers in summer and fall. Anywhere, but preferably in moist ground.

Gaillardia aristata. Yellow and brown, copious, all summer, useful for cutting. As a hardy perennial, the best of the genus.

Gypsophila paniculata. A profusion of whitish airy flowers well fitted for bouquet work.

Helium Hoopesii. Two feet; large, yellow flowers, in summer. Anywhere.

Iberis (Evergreen Candytuft), *sempervirens* and *correaefolia*. White flowers in spring and early summer. Neat, bushy; fitted for edgings. *Gibraltarica*, *Tenoriana*, and others are not hardy here, but treated as annuals they bloom nicely.

Jasione perennis. Pretty, copious, neat, blue-flowered plant, seldom met with, but very easily raised from seed. Although a boll-wort, its flowers resemble a Scabios.

Lathyrus latifolius. Rose-purple and white overlasting Poas. Should be in every garden. *Liatris* (Blazing Star). Handsome native flowers. Grow readily from seed, and bloom the second year.

Lindelofia spectabilis. Blue, in summer. A vigorous but neat border plant.

Linum. The perennial Flaxes, blue, white, and yellow; are very pretty in the forenoon. As cut flowers they are useless.

Lobelia. Our native Cardinal Flower is the prettiest of all, and no country garden should be without it and a good form of the blue *Lobelia* (*syphilitica*). Seeds sown outside in fall germinate in spring; if sown out-of-doors in spring they are not likely to grow, but if in boxes or pots inside all should be well. *L. splendens* and its varieties are not hardy.

Lychmis Chalcedonica, *Haageana*, *fulgens*, *Sieboldii*, and *Senno*, and their varieties and hybrids, are showy and hardy, and most of them bloom well the first year.

Oenothera fruticosa and *Missouriensis*, yellow; the last has very large, brilliant flowers.

Papaver pilosum and Oriental Poppies. They make a gay show in early summer, but are soon past.

Pentstemon Digitalis, *ovatus*, *barbatus*, and often *grandiflorus*; but the other handsome species, as *Murrayanus*, *Cobaea*, and *secundiflorus* have not been hardy with me. *P. Hartwegii*, the one that gives us so many fine garden varieties, is not hardy either, but if sown early it blooms freely in the fall.

Phyterima Chamaeli. Pretty violet-blue flower-heads. Anywhere.

Platycodon grandiflorum. Blue and white. Broad-flowered bell-worts; late summer and fall. Showy. Anywhere.

Polemonium caeruleum (Jacob's Ladder). Blue and white. Not showy, but very easily grown. *P. septans*, a small spring blooming sort, is pretty.

Potentilla. Double garden varieties give a good show.

Primula capitata, violet; *cortusoides*, purple; *Sieboldii*, various, fine; and the ordinary Cowslips, Polyantheses, and Primroses of gardens. Like a cool, moist place; sheltered and somewhat shaded in summer, and a thin mulch in winter.

Pyrethrum roscum, single and double. Pretty garden plants; bloom the first year.

Prunella grandiflora, bluish and white; and *Pyrenaica*, purple. Neat, free-blooming. Open or shady place.

Rudbeckia Californica, *laciniata*, *speciosa*. Strong-growing, showy, yellow flowers.

Salvia pratensis, purple, blue, or white; free-blooming. Some other fine sorts, as *farinacea* and *Pileheri*, said to be hardy, are not hardy here.

Statice latifolia, the best of the hardy ones. Late summer and fall.

Veronica (Speedwell). All, as *gentianoides*, *spicata*, *taurica*, *rupestris*, and *amethystina*. Beautiful, neat, free-blooming, mostly blue. Like rich, moist ground.

Viola. *V. cornuta*, blue or white, and Pansios; Shade from strong sunshine in summer, and shelter from winds in winter.

Fuca filamentosa. Very easily raised. Showy white summer flowers. Anywhere not shaded or wet.

WM. FALCONER.

[This list is not compiled from catalogues, but embodies the writer's extensive experience as superintendent of the Cambridge Botanic Gardens.—ED.]

PEONIES.

In order to treat of the cultivation of the Pæonies as fully and concisely as their importance demands, it is necessary to divide them into two classes, viz.: the Tree Pæonies, *Pæonia Moutan* and its varieties, and the more common herbaceous Pæonies.

Leaving it for the reader to decide for himself whether to cultivate his collection in groups on the lawn, on the margins of shrubberies, or in the mixed flower border, as may be most suitable for his purpose, I would remind him that although the Pæony is perfectly hardy, it will not succeed where water stands on the surface of the ground, or near its roots during the winter season, and that in order to secure satisfactory results it is necessary to properly prepare the ground before planting. The Pæony prefers a moderately enriched, deep loamy soil, or one that is prepared by digging or trenching the ground to the depth of two feet or more, and at the same time working in a good supply of well decayed stable manure. All the preparatory work should be done in the fall, or as early in the spring as possible, that the ground may become well settled before planting-time. In planting, place the roots from two to four feet apart, according to their size, bearing in mind that the plants increase in size yearly; but it is well to plant thickly at first, so as to secure a satisfactory display, and as they increase in size and become crowded, every other plant may be removed.

TREE PÆONIES.

Pæonia Moutan, the parent species of all our Tree Pæonies, is a native of China. All its varieties are dwarf, flowering shrubs, growing from three to five feet in height in about as many years. When planted in groups with other Pæonies, these should occupy the center. They are perfectly hardy, but do best if given a slight protection of evergreen branches during the winter season. A good dressing of well-decayed manure, given every fall and dug in in the spring, is much appreciated by them. The plants when young are of slow growth, and are rather difficult and slow of propagation, and on this account they cannot be obtained at a cheap rate, good strong plants being worth from one and a half to three dollars each, according to variety. The best six varieties are *alba plena*, *arethusa*, *extensa*, *Bunkerii*, *Reine Elizabeth*, and *Kochlerii*.

HERBACEOUS PÆONIES.

These should be given a treatment similar to that advised for the Tree Pæonies, with the

exception of protection during the winter; this they do not require, but they are greatly benefited by a good dressing of well rotted manure applied in the fall. These plants are truly the flower for the millions, and the ease with which they can be propagated causes them to be offered at such moderate prices that they are placed within the reach of all. They are generally classed into three

In the third, or Chinese (*P. Sinensis*) division, we have a large number of varieties to select from. The most desirable are *edulis* or *fragrans*, *festiva*, *fulgida*, *gubosa*, *flamei*, *Lothair*, *Oberon*, *purpurea*, *superba violacea*, *Whittleji*, and *carnca superba*.

The herbaceous Pæonies are propagated by carefully dividing the roots; which operation is best performed in the spring, about the early part of April.

The Tree Pæonies are propagated by grafting on the roots of *P. Sinensis* and its varieties. This is done by taking some strong single roots early in the spring, and planting them in good rich soil. Keep them growing until September; then cut a cion about three or four inches in length, sharpen it, and insert it firmly in the root; then cover with the earth that has been thrown out in order to insert the graft, and if the work has been properly done, the graft will take care of itself, and make a vigorous growth the ensuing spring.

CHAS. E. PARNELL.

DOUBLE-FLOWERED HERBACEOUS PÆONIA.

divisions, viz.: *officinalis*, *paradoxa*, and *Sinensis*.

P. officinalis and its varieties flower from the middle to the end of May. The most desirable varieties are *marima*, *rosca*, and *rubra*.

The beautiful *P. tenuifolia* and its double form are generally included in this division; these are to many the gems of the genus,

PÆONIA TENUIFOLIA FL. PL.

having rich, fern-like foliage and bright scarlet-erimson flowers.

The second division embraces but few varieties; *P. paradoxa*, *amaranthescens spherica*, with very double dark crimson flowers, and *puleherrima plena*, with dark crimson flowers of a purplish shade, are the most desirable for amateurs.

SOIL FOR FLOWER BEDS.

The soil best adapted for flowering plants, generally, is a light, friable loam, containing a moderate amount of vegetable matter, and sufficient sand to render it porous; but as it rarely happens that the amateur has much choice of soil, it is fortunate that most plants will accommodate themselves to any but such as is of an extremely dry, sandy, or calcareous nature, or of a stiff, heavy, retentive character. In the former the plants are sure to be starved, and in the latter, if they ever fairly take root, there is generally an undue development of foliage at the expense of the flowers. In soils of this description much may be done by thoroughly breaking up the superficial crust, or as it is technically termed, "trenching" it at least one spade deep, digging in sharp sand or road scrapings; and if the operation be performed in autumn so that the loosened soil is thoroughly exposed during the winter to the disintegrating influences of frost and other atmospheric agencies, the advantage will be greatly increased.

In soil of an opposite character, i. e., sandy or calcareous, the remedy will obviously consist in the addition of loam in conjunction with decayed leaves or old rotten manure; or where expense is no object, the surface may be entirely removed to a depth of eight or ten inches, and its place supplied with the best loamy compost at hand. Strong, crude manure of an animal nature should be avoided in flower beds.

FLOS.

The Window Garden AND GREENHOUSE.

RAISING FERNS FROM SEED.

Of the many operations pertaining to gardening, none are more absorbingly interesting than the propagating and raising of Ferns from spores or seeds, which most kinds bear abundantly. In ferneries where the conditions are favorable, the spores find suitable resting-places, on which they germinate fully. Indeed, the seedlings may be seen in vast quantities on damp bricks, on the sides of pots, on the surface of the soil, and in all sorts of positions. Although, however, Ferns come up in this promiscuous fashion, few think of sowing and raising them from spores; what youug ones they get aro by chance, but if any one will follow out the directions here given they may rear as many as they please, and that without much trouble.

The most important point toward the successful raising of Ferns is the preparation of the pots, which should be three parts filled with find potsherd, or soft red brick; then add the soil and press it down and make it perfectly level and smooth on the surface. Before doing this, however, it is always advisable to subject the soil, which should be a mixture of peat and fibry loam, to a good baking on a fine or other hot place, so as to destroy any eggs of slugs or weed seeds, in order that there may be nothing to interfere with the young Ferns when they come up.

In sowing the spores, take the frond they are on, after it has lain between paper for a few days, and sweep off the seed lightly with a brush in such a way that it may fall regularly over the soil. When this is done, the pot should be covered with a pane of glass and at once placed in shallow pans of water, and then set in a shady position in any house in which the temperature is kept between 60° and 80°; but this degree of heat is only necessary for the stove kinds; the greenhouse and hardy varieties germinate freely in any cold-frame, and may even be raised successfully in the window of a dwelling-house or behind a wall in the open air.

The first thing to be seen in the germination of Ferns is a filmy green scale, or prothallus; numbers of these soon spread themselves out over the surface of the soil, which they quickly cover, and after a short time tiny leaves or fronds may be discovered emerging from the center of the scales; and these fronds go on multiplying and increasing in size till perfect plants are formed. Up to this stage it will be necessary to keep the glasses close on the pots, as confined air and moisture are life to the young seedlings; but should they show signs of damping, then the glasses must be slightly tilted for an hour or two each day and let down again.

As soon as the minute plants can be fairly distinguished and are large enough to handle, they should be pinched off. The readiest way of doing so is to make a pair of tweezers, by bending a thin piece of lough green wood, and use them for taking hold of the young Ferns, when, with a pointed stick in the other hand, they may be dibbled in quickly without bruising or injuring them in any way. For pricking the seedlings in, fine peat and loam, mixed with a little sand, is

the best soil, and in this they should be made firm by watering gently, through the rose of a pot. As soon as that is done, it will be necessary to protect them again by covering them with panes of glass, unless the pots can be set under hand-lights or in propagating-boxes, where there is plenty of moisture to give the plant a good start. Wherever placed, it should be borne in mind that no sun must get at them, as it would dry and scorch them all up. To prevent this, a thin shade should be kept over them during the greater part of the day, and morning and evening the plants should be bedewed with a syringe. This will start them quickly into growth, and assist greatly in making them strong enough for potting off singly.

As soon as they are ready for this, coarser soil may be employed, and to insure the porosity of this,—an important matter in Fern cultivation,—it is a good plan to mix in with it some charcoal in small pieces or finely broken crocks, soft bricks or cinders, round any of which the roots will cling.

S. D., in London Garden.

NEPHROLEPIS DUFFIL.

A very distinct and remarkable Fern, of a close-tufted habit of growth, producing numerous fronds of a very peculiar character, and exceedingly ornamental. They attain a height of about 2 feet, with a bare stem of 6

NEPHROLEPIS DUFFIL.

to 8 inches, above which is a narrow linear frond about half an inch wide dividing into a multifid apex. The fronds have a drooping habit, with small rounded pinnae, which have the peculiarity of growing two together from the same point, and are crenate on the edge. It requires high temperature for its best development.

AUCUBA JAPONICA.

Every one knows that beautiful evergreen shrub, and nevertheless it is not as largely cultivated as it deserves. There is no shrub as easily cultivated. It grows well in all soils, although it prefers a light one. The only care it requires is to be placed in a shaded situation, quite under the branches of trees, and kept moist, like all Japanese plants. There it will grow constantly, and resist very cold winters. In my garden several of them resisted the severest winters, when a great many old trees were killed—Quinces, Pears, Cherries, and Evergreens.

It is well known that the Aucuba is dioecious, and that before 1863 we only possessed the pistillate, and therefore never

had seen the seed-pods. But since the staminate plant was introduced from Japan by Von Siebold, all the female plants bear fruit, which is exceedingly ornamental.

This shrub is also very interesting as a pot plant; of course, principally the pistillate. There are a great many varieties. I have obtained some by artificial cross fecundation, some with small and large leaves, some plain green, and some variegated and spotted yellow. If a dozen female plants are potted and put in a greenhouse with one male only, they will all be fertilized and covered with seed-pods in December, which will become reddish about February, and remain on the plants until the end of March. In that state they are exceedingly ornamental for in-door decoration, at a time when flowers are scarce, and by their fine glossy leaves they show to good advantage with other plants.

Their propagation is very easy, cuttings put in water strike roots rapidly, and this is the best mode to multiply them, although they may also be raised from seed.

JEAN SISLEY, France.

ROSES FOR WINDOWS.

Roses require a season of rest some time; they cannot be forced continuously the year around. If we secure a good growth early in the season, the plants will have ample time to ripen their wood before freezing weather sets in. Should they take a rest during early summer and form their growth only in late autumn, the show of bloom will in consequence be meager.

There are two systems in use; one is to pot the plants into five or six inch size, using light turfy rich soil, with good drainage, and then sink the pot up to the rim in the ground. Cover the surface of the soil with a light mulch to prevent evaporation, and water frequently. An occasional dose of weak liquid manure, and soap-suds from the kitchen, will stimulate the growth. They may remain in the open air till the ground freezes; then prune back the strongest shoots and remove in-doors.

The other system is that of planting the Roses in the open ground early in summer, allowing them to remain there until late autumn; then carefully lift and pot. In this case the plants necessarily receive a check which may or may not injure them for forcing purposes, depending altogether upon the care bestowed. For the novice, the former plan would, perhaps, prove preferable. People who love flowers generally succeed with them, because they are always on the alert to water at the right time, to keep off all injurious insects, and to give a breath of fresh air on suitable days.—JOSIAH HOOPES in N. Y. Tribune.

STIGMAPHYLLON OLIATUM.

This plant, a native of Brazil, should be soon oftener in greenhouses than it is. It is of a climbing habit, the leaves, the edges of which are fringed with hairs, are of a glaucous hue. The flowers are produced in umbels of a rich yellow color, and continue in bloom the entire summer. The proper soil is a mixture of loam and leaf mold. Care should be taken to have the shoots properly trained as they are liable to get entangled to the detriment of the flowers.

THREE GOOD BEGONIAS FOR THE WINDOW GARDEN.

I have given up trying to grow *Begonia Rex* in the window garden. It would live there for an indefinite length of time,—in fact, I never had one die,—but it lives at such a “poor dying rate” that I get discouraged. It usually manages to have on it one tolerably fair leaf and a little mouse-ear, fuzzy tuft that may become another leaf sometime, if nothing happens to it. But one swallow doesn't make a summer, they say, and one leaf doesn't make an attractive plant out of even a *Rex Begonia*.

But I have three *Begonias* in my collection which afford me complete satisfaction. Not three of the rarest varieties, by any means, but three good ones; and if a plant is good, it makes but very little difference whether it is a new or an old kind. These three are *rubra*, *picta*, and *Weltoniensis*.

B. rubra is certainly the most satisfactory one I have ever grown. My plant was a small one last spring, but it has flourished wonderfully since I obtained it. I potted it in a soil composed of turfy loam and some earth from a corner of the barnyard fence, where the rains usually left a puddle of water standing, and the richness of the manure pile had soaked into it until it had absorbed the best elements of the heap. To these was added some sharp sand—enough to make the compost crumbly when taken up in the hand and squeezed together. Along in June, it sent up a new shoot from the roots, and it did not stop going up until it had reached a height of three feet and a half. Then it began

to send out branches from each leaf, and these branches were covered with large, healthy, dark-green leaves. So heavy is the mass of foliage on the plant that I have had to put three stout sticks in the pot to support it. The plant almost fills an ordinary window, and it would be sure to attract a great deal of attention if it had no flowers. Add to the beauty of the leaves and its extremely graceful habit of growth, the large clusters of bright crimson-scarlet flowers which are produced so plentifully, in charming contrast with the foliage, and it is hard to find a more showy or desirable plant.

B. picta is not so robust a grower, but it grows well, and gives a compact mass of pale-green foliage, spotted with silvery white. Its flowers are a pale pink or flesh color. The under side of the leaves is red, shading off toward the edges into olive. It makes a very handsome plant.

B. Weltoniensis is a general favorite, as it deserves to be. It sends up so many stalks, all covered with shining, rich green foliage of such graceful shape, veined with crimson, that a pot of it soon becomes a most attract-

ive feature in any collection. It is not uncommon to see plants two feet and a half across, and about that in height,—a mass of luxuriant growth,—and the greater part of the winter will see it sprinkled over thickly with rosy flowers. I have never failed in raising fine plants of this variety. No insect troubles it. It stands the close air of rooms well, and does not care for very much sunshine. I tied small weights on the lower branches of the plant I have now, and they drooped in consequence, completely hiding the pot. The plant is a rounded mass of crimson stalks, well covered with foliage.

In spring I cut the tops off, and let the roots rest for six weeks, by keeping them pretty dry. Then I repot and give more water, and soon the plant starts into growth again. Though not as showy as a *Geranium*, I would prefer it to any. EBEN E. REXFORD.

BRACKET GARDENING.

Portable plant-stands, placed in windows, says a correspondent of the *Springfield Re-*

BEGONIA RUBRA.

publican, were formerly the only receptacles for house-plants, and as they effectually barricaded them, they were not always admissible; but now there are various fixtures for plants which take up no space in the apartments, and yet are so arranged that the plants can be brought close to the glass.

Bronzed and gilded brackets, with stands for one, two, or even six flower-pots, can be attached to any window casement, and, as they can be drawn close to the windows during the day and turned back against the wall at night, they protect them effectually from the chilly night air. Three or four of these brackets can be fastened to each side of the casement, and a large number of plants can be cultivated upon them. As the plants are easily reached, they can be turned frequently and not be allowed to grow one-sided, as is the case in plant-stands. Every withering leaf can also be plucked off, and water can be more quickly given.

I have ten brackets attached to my parlor windows, and upon them twenty-five plants are placed, and most of them are in full flower. *Begonias*, *Fuchsias*, *Geraniums*,

Primroses, a night-blooming *Jessamine*, *Cestrum nocturnum*, and *Oxalis* are all growing luxuriantly, and my bracket-gardening has proved a great success, and adorns my windows more gracefully than the richest draperies of lace or Persian manufactures could do, while the sunlight is not excluded from the apartment by the delicate traceries of the foliage of the plants.

PROPAGATING VERBENAS.

For the past two years I have practiced, with perfect success, a method of propagating *Verbenas* which is so easy, and at the same time so certain, that I give it here for the benefit of the readers of *THE AMERICAN GARDEN*.

At the close of the bedding season I select the best *Verbenas* for color, etc., and drag up a handful of the runners. These are placed in a shallow box—say three inches deep—and over them is thrown a shovelful or so of road sand. They are watered and put in the shady side of a cold pit.

From November till March first they wont grow three inches; but if they happen to have too rich sand on them, shear them down to the level of the box, if they peep over it. In March go over them carefully, pinch every terminal eye, cover an inch or two with swamp moss mixed with about one-twentieth part of its bulk of fine bone dust, and expose to full sun. The quantity of young shoots that will put out is past belief. A cutting bench must be large, if a few boxes treated as above wont fill it in a week or two. For amateurs, with always more “stuff” requiring shelter than room, the above may be useful. WM. M. BOWRON.

ABOUT CALLAS.

Every one knows that the *Calla* requires rich soil and frequent watering, but very few amateurs give enough heed to this so as to have the earth sufficiently rich or the water supply sufficiently abundant. Nothing but the most severe perseverance in having the earth as much as half manure will insure success; then the plants when growing vigorously must not only be kept as wet as possible, but they delight in warm, and even moderately hot water. As ordinary saucers are shallow, we have placed a pot of *Calla* in a large earthen wash-basin, which we keep filled with warm water. It is also requisite to cut off each flower as soon as it shows any sign of withering; the result will be that a new bud will very soon make its appearance, often before the old stem is wilted.

S. H. H.

Lawn and Landscape.

A LANDSCAPE PICTURE. THE CATSKILLS.

Dr. William Adams, in his beautiful home on Orange Mountain, had a pleasant way of inviting his visitors to take a look at a wonderful picture which he had, by the greatest of artists. Then he would throw aside the curtains of his large front window, which he had framed after the manner of a painting, and reveal to them the extensive, diversified, picturesque, and inspiring scene.

I, too, am so happy as to possess one of the first works of that same incomparable artist, "who alone hath immortality," says the venerable Dr. F. N. Zabriskie, in the *Christian Intelligencer*. It is the view, not from, but of, a mountain, or rather of that long and lovely mountain range known as the Catskills.

Immediately in front of my window are two tall and vigorous Maples, through whose leafy curtains I have to keep cutting tunnels of sight. They act in summer as fringed frames and as concentrating mirrors for my pictures. In the autumn they are gilded and crimsoned and purpled as Titian himself could not have done them, had he turned frame-maker. In the winter their springing and pointed arches and interlacing boughs, especially when outlined against the sunset, give my mountains the setting of a Gothic window.

Thence the eye wanders down through garden and orchard and grain-fields, and across the broad idyllic meadows that everywhere border the winding Rolokoke Creek, till it comes to Beecraft Mountain—which is a frog, but knows enough not to inflate itself into rivalry with the mighty Catskills. So it quietly lies down at their feet like a faithful hound, and disposes itself as gracefully as possible at full length before them, as the rugged step of a throne.

Beecraft Mountain, albeit bare and rocky in places, especially on the summit, and resounding ever and anon with the blast-thunders of its stone quarries, is largely overspread with a covering of forest and farm, which in summer and autumn outshines the Persian carpets or the Turkish rugs of the "gorgeous East." And at all seasons they hold up against the background their long green line of Pine and Cedar and Spruce and Hemlock points, which perform so indescribable a purpose both of ornamentation and illusion in a landscape. And back of all this rise my beautiful, billowy, sublime, and kingly Catskills!

RAISING TREE SEEDLINGS.

All tree seeds which require careful nursing, shading, or other special treatment, or which are adapted to being grown very closely together at the start, should be sown in a well prepared seed-bed. Only a small piece of ground is needed for this purpose, and a portion of it should be covered with open lattice-work, or in some other way prepared so as to partially exclude the sun's rays, and also admit the rain, to be devoted to those small seedlings which need shade the first season from transplanting.

After the bed has been made smooth and

level, take a small marker with teeth set six inches apart, and open the rows by drawing it across the bed. Sow the seed thickly in the rows; then, by placing the marker so that the teeth will pass half way between the rows, and drawing it across the bed, the seed will be nicely covered.

Tree seeds, as a rule, should be covered very lightly—just sufficient to hide them from view. This will apply to all small seeds and most large ones. If the ground seems to be too dry at the surface, better take pains to keep it moist with a sprinkler than to bury the seeds so deep that they can never reach the light. The distance to which a shoot can push upward through the soil before its vitality is exhausted varies, usually, according to the size of the seeds; but in all cases it is very limited, excepting the Walnuts, Oaks, and a few other kinds, which grow strong tap-roots.

The time for sowing most varieties is late fall or early spring—either, according to convenience. Those seeds which are liable to be injured by drying can be kept fresh through the winter by mixing them with sand and placing them in the cellar, or they can be boxed up and buried in the ground. Some varieties, not affected by frost, can be left on the surface of the ground, and covered with a litter of leaves or straw.

All the seeds of coniferous varieties are greatly benefited by soaking in warm water for four or five days previous to sowing, changing the water daily to prevent souring or fermentation. After having been soaked, as above recommended, to facilitate sowing, they may be rubbed in dry sand to remove the surface moisture, and the sand sifted out with a fine sieve. The seed-bed should be gone over several times during the summer, and all weeds and grass carefully removed.

Many varieties of tree seeds do not germinate until the second season from sowing. In such cases, small stakes should be stuck at intervals along the rows, so that their location may be known at time of weeding, and care taken not to displace the dormant seed. All varieties planted in the seed-bed which do not attain a growth of say five inches the first season, should be allowed to remain there until after the next season's growth. This will include about all of the evergreen varieties, and some of the others. Those which exceed five inches should be transplanted into the seedling nursery after the first year's growth, and all the others after two years' growth.—*Forest Leaves.*

Foreign Gardening.

ASPARAGUS CULTURE IN FRANCE.

Perhaps in no other locality is the culture of Asparagus carried to so great a degree of perfection as in the suburbs of Paris. In certain localities in the neighborhood of this great city, Asparagus growing, both for the young shoots and for the plants, is a very prominent industry. The methods of culture adopted there are, in some respects, quite different from ours. While in our land of high-priced labor it would be unprofitable to expend the amount of care upon our vegetables that the English and French gardeners do, a study of their painstaking

methods sometimes offers suggestions by which we can profit.

The French are not in the habit of trenching the soil for their Asparagus beds. They say it is entirely unnecessary. The roots of the plant, they claim, have little inclination to run deeply, so long as the surface soil is well cultivated, and contains all the nutriment the plants can use. They agree, however, that Asparagus requires very high manuring, and they use for this purpose the most concentrated natural manures they can obtain.

In starting a bed, seedling plants one year old are always used when they can be obtained. These are considered superior to older plants. Great care is taken, however, that the plants receive no check to their development, either through lack of nourishment or moisture. After having their bed thoroughly prepared, the Paris gardeners dig a shallow trench, about a foot wide and six or seven inches deep, for each row of plants. The rows are usually placed about four feet apart, and the plants set one to two feet apart in the row. They raise little mounds about two inches high, upon each of which a plant is placed, and the roots carefully spread out over this, so that they extend in all directions. They then draw in soil enough, so that the crown of the young plant is covered about an inch deep. The ground is always kept well cultivated, and each autumn a liberal dressing of manure is given. The soil that is washed into the trench is carefully removed before winter, so as to leave the roots no deeper covered than they were in the spring.

Every spring, the bed is forked over, always taking care not to injure the roots. The third spring after the plants are set, it is allowable to gather two shoots from the more vigorous plants; though it is considered best to defer the cutting until the fourth year.

French gardeners are quite whimsical, too, about the manner of gathering their Asparagus. They say that the neat Asparagus knives advertised in the catalogues are intended for delicate people who are afraid of soiling their fingers; and the only proper way is to pick the shoots by hand. They consider it quite important to break them off at the point where they are united to the root, rather than in the ground above this point, as we usually do. They remove a little earth about the shoot with the hand, then work the fore and middle fingers into the soil near to the point of attachment, when a slight pressure of the finger under the base of the shoot causes the latter to snap off clean at the root.

They consider a shoot of proper size to pick when the head is an inch above the soil. White Asparagus is considered more delicate in flavor by the Parisians than that which is permitted to take on the green color. The former brings much the higher price in the markets. Salt is not used to any considerable extent as a fertilizer for Asparagus by the growers about Paris.

Although the market gardener cannot afford to practice all the minutiae described, in the family garden, it should be our aim to secure the best and the earliest of vegetables; and if by adopting the methods of others we may improve the quality and earliness of the products of our own garden, we can afford to take a little extra pains.

Horticultural Societies.

NEW-YORK HORTICULTURAL SOCIETY.

The leading feature of the March exhibition of this society was the grand display of Narcissus made by Woolson & Co., Passaic, N. J. It was undoubtedly the finest collection of the kind ever exhibited in America, filling an entire table of the whole length of the hall, and comprising one hundred and sixteen different species and varieties. The great improvements which have been made in this class of bulbous plants within the last few years, can hardly be imagined without having seen such a collection. These plants were of course grown in pots, and had been slightly forced; yet most of the varieties are of easy culture, and are perfectly hardy in this latitude.

Roses, as usual, attracted the most marked attention. All the popular and many rare varieties were represented, and most of them in exquisite specimens and large quantities, so that it would have been no easy task to single out the best.

Orchids from several exhibitors made a magnificent display, and some specimens of *Phalaenopsis Schilleriana* excelled in gorgeous beauty even those shown at previous meetings.

There were several meritorious collections of cut flowers on the tables, and it is gratifying to note that the intrinsic value of these exhibits is perceptibly improving.

Carnations, Primulas, Hyacinths, Tulips, Lilies of the Valley, and many other plants, which we have not space to enumerate, completed this interesting exhibition.

MASSACHUSETTS HORTICULTURAL SOCIETY.

Storm and sleet are in keeping with the 20th of March, but the Rose and Azalea show, which takes the edge off the rude season for flower-lovers, opened bravely as usual. There is something substantial in the habits of a society which owns its granite building and holds \$200,000 of property, besides a library whose very titles are enviable to a student of horticulture. The exhibition is not limited to Roses and Azaleas, which were rivaled in attraction by inviting groups of spring flowers.

The show of Azaleas from the Hoveys of Cambridge was arranged with peculiar taste,—the rosy, pale, and crimson clouds of blossoms rising in ranks against a large window, coloring the light-like stained glass, while among them rose pots of tall Bermuda Lilies in bloom, with best effect. Azaleas always should be shown against the light, which heightens their transparent coloring. The unique specimen labeled Mme. Leonie Van Houtte, spotted red, flesh, rose, and striped white blossoms on one plant. Mr. McLaren, the large grower from Forest Hills, showed Treo Azaleas in finest bloom, trained in most scientific fashion, stems bare and straight as walking-sticks, with a tuft of large, pure blossoms at the top. The society exhibition would not be complete without ex-President Wilder's collection of Azaleas, notable for forty years, the latest seedling, labeled by the veteran's own hand, being a pure white, single flower with oval petal, almost as regular as a Camellia. His M. Versohaffelt is one of the finest showy Azaleas, like a Lady

Washington Geranium, rose-white with carmine stippled center. Baron de Vriere, full ruffled white with sparro tinges of rose; Marquis of Lorne and M. A. Hardy, deep salmon reds; Rosy Morn and Decora, deeper crimson, may be mentioned as Azaleas which group well together, a point lost sight of, or not at all considered in Azalea houses, but which concerns the fullest appreciation of their beauty.

The winter past has not been a good one for Roses, and growers deserve all the more credit for results obtained. W. C. Strong, of Brighton, showed a dozen Baroness Rothschild in fine bloom, grafted January 20th. J. B. Moore & Sons, Concord, had among other plants the Marquis Castellani, one of the finest pink Roses in color known, and a Mabel Morrison, which they grow to perfection, also H. P. Roses, not generally grown; the Duchess of Vallombrosa, finer pink than Baroness Rothschild, making a fine group with the pale Merveille de Lyon and pearly Jules Finger; Mrs. Harry Turner, a deep scarlet velvet; Camille Bernardin, which shows good substance, spite of the month, which leaves other Roses tender-petaled for want of sun; and last, the new Rose Gabriel Luizet, over which growers are enthusiastic, pronouncing it the form of La France, with better coloring. It certainly has good qualities,—a long, upright stem, pointed buds, finely cupped flower, outer petals recurved, and pure attar scent. It will likely prove a good bouquet Rose, as the Marquis Castellani will be a fine one for the corsage, finished in form, bud, and tint, but not over large. S. D. P.

COTTON CENTENNIAL EXPOSITION.

The Centennial Anniversary of Cotton Exportation from America will be fitly commemorated by a grand World's Exposition to be held at New Orleans, La., commencing on the first Monday in December, 1884, and closing not later than May 31, 1885.

The Horticultural Department, which has been placed under the superintendence of Mr. Parker Earl, promises to combine the most extensive exhibits in its various branches that have ever been collected on this continent. The horticultural group has been divided into the following classes:

1. Ornamental Trees, Shrubs, and Flowers.
2. Conservatories and their Management.
3. Implements and Accessories.
4. Garden Designing and Construction.
5. Vegetables.
6. Fruit and Fruit-trees.
7. Seeds and Saplings of Forest-trees.
8. Gardens for Dwellings:

For schedules and any information pertaining to the Horticultural Department of the Exposition, address

Mr. Parker Earl, Cobden, Ill.

THE WEST TENNESSEE HORTICULTURAL SOCIETY.

This society will hold an exhibition of Strawberries, vegetables, and flowers, in the city of Jackson, Tenn., on the 8th, 9th, and 10th days of May, 1884. All horticulturists are cordially invited to attend.

Premium list and programme, giving full particulars and much valuable information about the advantages of West Tennessee as a fruit-growing country, can be had by postal-card request to Jno. T. Stark, Jackson, Tenn.

Miscellaneous.

FASHIONABLE ROSES.

Dark colors, the darker the better, are now all the rage for corsage flowers in Paris, and a great demand for the new dark Tea Roses has in consequence been created. Buds of *Paul Neyron*, a very large, dark Hybrid Remont Rose, are also much worn.

P. J. A. BERCKMANS.

The *Rural New Yorker* gives in a recent issue a most excellent and life-like portrait of this distinguished horticulturist, which, in artistic execution and likeness, is as superior to the ordinary newspaper portraits as cream is to skim-milk. Mr. E. S. Carman is doing praiseworthy service in thus introducing the prominent men of the profession to his readers.

CULTIVATING NETTLES.

Nettle cloth, which before the introduction of cotton fabrics was held in high esteem, stands a fair chance of coming into vogue again. Modern science and machinery are supplying improved methods for its successful manufacture, so that the Nettle is now actually being cultivated in Germany, where its fibre is made into a variety of textile fabrics. A Dresden manufacturer has produced from it the finest thread known to the trade, of which a length of sixty miles weighs only two and a half pounds.

AMERICAN POTATOES IN ENGLAND.

A leading English magazine says, in a recent issue: "The quality of Potatoes raised in England is, on the whole, so superior, and the preference for them is so great that it does not pay to import novelties from abroad." Yet, strange to say, a list of "Choice Potatoes for Profit and Exhibition, consisting of the finest varieties that have been introduced to cultivation," published in the same number, contains:

Pride of America, Snowdrop, White Elephant, American Purple, Beauty of Hebron, Early Gem, Bresee, Late Rose, Queen of the Valley, Trophy, Adirondack, Blush, Matchless, and Triumph, all American varieties, and over one-third of the entire list.

NOTICES OF THE PRESS.

THE AMERICAN GARDEN, published in this city, is a faithful guide in all matters relating to work in the garden or on small farms.—*The Continent*.

THE AMERICAN GARDEN, one of our most popular horticultural journals, commenced its fifth volume recently by appearing in an elegant cover, which adds greatly to its former handsome appearance.—*North and South*.

THE AMERICAN GARDEN is always bright, beautiful, and fresh, as if from the land of flowers. The publishers enjoy rare facilities for giving their patrons a valuable journal, and the editor, who is recognized high authority in horticultural matters, spares no pains to keep each number up to its high standard.—*The South*.

THE AMERICAN GARDEN presents a greatly improved appearance in its neat and prettily designed cover. Its contents are of great interest to either the professional gardener or the amateur, and its reading matter is profusely illustrated with designs of fruits, flowers, etc.—*Queens Co. Sentinel*.

OUR BOOK TABLE.

Proceedings of the Portage County, Ohio, Horticultural Society, H. Y. Beebe, president; Andrew Willson, secretary.—The transactions of this vigorous and excellent society are always perused with much interest, and never without finding much valuable and interesting information in them.

The Undine Region of South-western Minnesota. A pamphlet published by the State Board of Immigration, and giving a general description of this region. H. H. Young, St. Paul, Minn., is the secretary of the board, and will give desired information respecting this and other parts of the State.

Godey's Lady's Book is fully justifying the expectations which we anticipated under its new management. Each number appears to be an improvement upon the preceding one. The March number is especially varied and rich in interesting and enjoyable matter. In addition to the usual number of fashion-plates, it contains the touching steel engraving, "Far From Home."

The Hygienic Home Cook-Book; or, Healthful and Palatable Food without Condiments. Fifth edition. Price, paper 25 cents; cloth 50 cents. Fowler & Wells, Publishers, 733 Broadway, New-York. It is not a work on the philosophy of food, but one giving recipes for its healthful and palatable preparation, and it would be hard to find more information condensed in so small a space than is given in this home cook-book.

Kansas.—A pamphlet of sixty pages, containing information concerning its Agriculture, Horticulture, and Live Stock, together with statements relating to vacant lands, schools, churches manufactures, wealth, mineral resources, etc. Prepared by the State Board of Agriculture, and published as a guide to those seeking homes in the West. Copies may be had by addressing the secretary, Wm. Sims, Topeka, Kansas.

Living in Florida.—We have received from Home and Farm a neat pamphlet containing the letters of its Florida correspondent, Mrs. L. B. Robinson. These letters are valuable because they truthfully describe all the difficulties new settlers in that State must expect to encounter, and they give just the information about everyday life which cannot be obtained from official reports or pamphlets published by land agents. Every one interested in Florida ought to have this pamphlet. Price, twenty-five cents. Address Home and Farm, Louisville, Ky.

Bay State Monthly, Boston. The initial number of this magazine commences with an excellent portrait and a condensed biography of the Hon. Marshall P. Wilder, President of the American Pomological Society. This will be welcomed with delight by his many friends and admirers; for few can be aware of the many important positions he has filled, and the powerful influence he has exerted upon the development of the industries, education, and general progress during the past half century. The publishers are to be congratulated upon choosing the most renowned and most worthy of New England's sons to introduce this publication to the world.

A Primer of Horticulture, for Michigan Fruit Growers. Prepared for the use of beginners in Horticulture, by Secretary Charles W. Garfield, Grand Rapids, Mich. A pamphlet of sixty pages. Price, 15 cents. This is a unique and most valuable publication, the conception and execution of which does high credit to its editor. The prime object of the work was to answer the many questions frequently asked by young people who are just starting in rural life, and desire to bring about the comforts that horticulture may afford. To this end Mr. Garfield has induced several of our most experienced horticulturists to write short practical essays on the various kinds of fruits and vegetables, the flower garden, the conservatory, ornamental planting, the value of observation, and other topics. All these are contained in the pamphlet, and a greater amount of solid practical information, it would be difficult to condense into an equal space. The work, although principally intended for residents of Michigan, is of equal value to horticulturists anywhere.

CATALOGUES RECEIVED.

J. Jenkins, Winona, O.—Price List of Fruit and Ornamental Trees, Small Fruits, etc. The raising of Tree Seedlings is made a specialty at this establishment.

J. Churchman, Burlington, N. J.—Illustrated Circular of the new Raspberry, "Superb," the excellent qualities of which are indorsed by many testimonials from prominent fruit growers.

Geo. S. Josselyn, Fredonia, N. Y.—Circular Price List and description of "Fay's Prolific Currant," introduced by this firm, and recognized as the best and most valuable red Currant in cultivation.

William B. Reed, Chambersburg, Pa.—Catalogue of New, Rare, and Beautiful Roses, Hardy Shrubs, etc.—a carefully selected list, with accurate descriptions of all the best and choicest varieties.

John G. Burrow, Fishkill, N. Y.—Illustrated Catalogue and Price List of Grape-vines, Small Fruits, etc., with colored plate of the Atlantic Strawberry. New and choice hardy Grapes a specialty.

Green's Nursery Co., Rochester, N. Y.—Illustrated Catalogue of Trees, Plants, and Vines; Small Fruits a specialty, with handsome colored plate of the James Vick Strawberry, which has its head-quarters here. The pamphlet is full of sensible and practical advice of great value to every one interested in fruit culture.

Wm. Parry, Parry P. O., N. J.—Descriptive Catalogue and Price List of Strawberries, Raspberries, Blackberries, Grapes, Currants, Gooseberries, Fruit and Ornamental Trees, etc., comprising all the best new and old varieties. Colored plates of Kieffer Pear, Atlantic Strawberry, and Hansell Raspberry. The Kieffer Pear and Wilson Jr. Blackberry, are among the leading novelties of the season.

Mapes' Complete Manures.—A pamphlet giving descriptions, analyses, and prices of the various fertilizers manufactured by the Mapes Formula and Peruvian Guano Company, 158 Front Street, New-York. It contains also valuable information about the use of fertilizers in general, the cultivation of the principal farm and garden crops, and hundreds of reports from prominent farmers throughout the country. It is sent free to all applicants.

E. P. Roe, Cornwall-on-Hudson, N. Y.—Catalogue of Small Fruits and Grape-vines. This, as Mr. Roe informs his patrons on the first page, will be the last one to be sent out by him, as the labor and cares of business interfere too much with his literary work, and that he has therefore decided to close up his plant business. For Mr. Roe's personal welfare we are glad of this change, as no one could, without detriment to his health, conduct so extensive a business in addition to the performance of a large amount of literary work. But to the nursery business in general his retirement is a real loss, for no one has done so much to elevate and dignify the culture of small fruits, and bring their refining influences to the notice of country residents, as he.

The stock for sale is large and of best quality, and those intending to plant will find it to their advantage to send for a catalogue.

ANSWERS TO CORRESPONDENTS.

Flowers for the Adirondacks.—S. H. H., Milton, N. Y.—Nearly all the animals marked hardy in seed catalogues will succeed in that region. We would by all means try the Wild Garden seeds; among so great a variety, there are surely some suited for every latitude and climate.

Plant Protectors.—T. U. W., Granitville, N. O.—There are several kinds of appliances manufactured and sold in seed stores, for the protection of plants against sudden frost and also against insect depredations. With small plants, an inverted flower-pot answers the purpose completely.

Jasmino.—Mrs. C. B. B., Palmyra, N. Y.—The common Justine succeeds best in a compost of equal parts of peat, loam, and well-decomposed leaf-mold mixed with fine sand. The best time for transplanting is in spring, when the roots as well as the old wood should be pruned back. During summer, when growing, it delights in light tem-

at rest, it should have comparatively low and dry atmosphere. Our January number contained an article on Allamandas.

Golden Millet.—P. B., Charlotte, N. C.—This is a valuable forage plant, especially where the ordinary meadow grasses do not succeed well. If wanted for soiling purposes, it should be sown at intervals from the earliest period; the ground can be worked till the middle of July. It is generally sown broadcast, at the rate of two to three pecks per acre.

Lucerne thrives best on deep, light soil. For sowing broadcast it requires twenty to twenty-five pounds of seed per acre.

About Wistarias.—Mrs. F. B., Toronto, Kansas.—There are several species and varieties, but the Chinese is the one generally grown. Wistarias are somewhat fastidious about their positions. A plant may grow luxuriantly in a certain location, while another, under apparently the same conditions, refuses to grow. Would advise to take the plant up carefully, spade the ground deeply, pulverize finely,—but do not add manure,—and set the plant out again, cutting back to a single eye. Mulch the ground in summer.

Insects in Flower-pots.—S. H. H., Milton, N. Y.—The minute insects which infest the roots of your pot plants are no doubt the "Ground Aphid," a common pest of house plants, especially when kept in a dry atmosphere. The most effective remedy is a strong decoction of Tobacco stems, about half an ounce to a gallon of water, and boiled until it has the color of strong Coffee. When cold, pour into the pots enough to saturate the entire mass. When plants are very badly affected, it may become necessary to shake out the soil, wash the roots, and repot in proportionately small pots, giving rather sandy soil and good drainage. The tops should be cut back at the same time, and the plants kept in a moist, shady position for a few-days.

Extent of the Corset Industry.—The annual sale of Corsets in the United States is about \$10,000,000, of which two millions are imported and eight millions are manufactured in this country. The largest manufacturers of the world are WARNER BROTHERS, whose factory is located at Bridgeport, Conn., with salesrooms at New-York and Chicago. The business of this firm has been built up entirely within the past ten years, and is due largely to the discovery by them of a stiffener for corsets, called Coraline, which they use in place of the rigid and brittle whalebone heretofore employed. The cloth which this firm cut into corsets in a single year, if drawn out in a continuous line, would more than reach from Boston to Chicago, while the Coraline which they use in stiffening these corsets would extend over half-way around the earth.

IMPORTANT.

When you visit or leave New-York City, save Baggage, Expressage, and Carrriage hire, and stop at the Grand Union Hotel, opposite Grand Central Depot. 600 elegant rooms, fitted up at a cost of one million dollars, reduced to \$1.00 and upward per day. European Plan. Elevator. Restaurant supplied with the best. Horse cars, stages, and elevated railroad to all depots. Families can live better for less money at the Grand Union Hotel than at any other first-class hotel in the city.

BRAIN AND NERVE FOOD.

FROM THE NERVE-GIVING PRINCIPLES OF THE OX-BRAIN AND WHEAT GERM.

Vitalized Phosphites.—Restores the energy lost by nervousness, weakness, or indigestion; relieves lassitude and neuralgia; refreshes the nerves tired by worry, excitement, or excessive sensitiveness, and strengthens a failing memory. It aids wonderfully in the mental and bodily growth of infants and children. Under its use the teeth come easier, the bones grow hotter, the skin smoother, the brain requires more readily and sleeps more sweetly. An ill-fed brain forms no lessons, and is peevish. It gives a more intellectual and happier childhood. Not a secret remedy; formula on every label. For sale by Druggists, or mail, \$1. P. CROSSBY & CO., 661 & 663 Sixth Ave. New-York.

TAKE NOTICE.

For 60c. (in stamps) 200 Elegant Scrap Pictures.

A Present to Every Subscriber TO THE AMERICAN GARDEN.

While we offer a choice of many fine things to those who take time and trouble to aid the publishers in extending the circulation of THE AMERICAN GARDEN, as a recognition of their kind efforts and as a reward or pay for such aid; and while we intend to and shall make THE AMERICAN GARDEN worth to every reader many times its small cost, yet we desire to give a friendly recognition of some direct kind to each one of our readers as far as possible; and having unusual facilities for securing valuable seeds, etc., desirable for use or for trial, we offer to every subscriber to THE AMERICAN GARDEN his or her own choice of any one of the Seed, Plant, or Bulb parcels named below.

THIS OFFER IS TO EVERY SUBSCRIBER, for one year, whether subscribing singly, or in Premium or other Clubs.

In sending your subscription or giving it to club gatherings, give in each case the letter indicating what you desire.

Our readers will notice that many of the things named are new and rare, and of extraordinary merit. To purchase these (if they could all be bought) would cost 25 to 50 cents each.

POSTAGE FREE. All the articles offered as presents below will be sent postage prepaid.

FLOWER SEEDS.

Directions for culture are given with each package.

A. Wild Garden Seeds.—A half-ounce packet. This novelty in flower gardening, which was first introduced as an AMERICAN GARDEN premium, continues to be a general favorite; and being in greater demand than ever, we retain it among our premiums. The present selection contains over 100 varieties of choice flower seeds, which, in single packets, could not be bought under \$5.00.

B. Single Dahlias.—A packet of seeds carefully selected from over 100 varieties, comprising all the most brilliant and decided colors. If sown in early spring, in pots in the house or in the hot-bed, flowering plants may be had by mid-summer.

C. German Pansies.—A packet of fifty seeds of these lovely flowers, of which one can never get tired. The seeds here offered are from the best and choicest collection in Germany.

D. Asters, Choicest Mixed.—The most desirable and valued varieties of the best German and French strains, are represented in these packets, which are vastly superior to what is generally known as Mixed Asters.

E. Everlasting Flowers.—A mixed packet of 12 distinct varieties. This class of flowers is constantly increasing in favor; and for winter bouquets and decorations generally nothing is more treasured. All are annuals of easy culture.

F. Ornamental Grasses.—A mixed packet of the twelve best varieties. As an accompaniment of flowers, fresh or dried, in bouquets or vases, nothing can be more appropriate and graceful than sprays of ornamental grasses.

VEGETABLE AND FARM SEEDS.

G. Pea, Bliss' Ever-bearing.—A sample packet of this extraordinary new wrinkled Pea, which is now, for the first time, offered to the public. For large yield, excellent quality, and continuance of bearing, it has no equal.

H. Cauliflower, Sea-fam.—One packet. This valuable new variety combines more desirable qualities than any of the older kinds; in size and beauty, and especially in reliability of heading, it excels all others.

I. Water-melon, American Belle.—One packet, now first introduced, and of great value for home use as well as for market. It is very large, early, and of delicious quality.

J. Oats, Black Champion.—A sample package. These Oats were selected from a number of varieties received from Europe, and are of great promise. Selected heads have averaged one hundred and sixty-nine grains. The roots tiller more abundantly than those of any other variety, so that half the quantity of seed usually sown per acre is sufficient.

K. Barley, Imperial.—A sample packet. All reports about this new variety speak in highest terms of its excellence. In yield and quality alike, it is a valuable acquisition.

L. Potato, Tremont.—One tuber. A medium early variety of excellent quality; now offered for the first time.

M. Potato, Iroquois.—One tuber. A large, handsome variety of good quality, large yield, and superior keeping quality; now first offered. Both varieties received First Class Certificates of Merit by the London Royal Horticultural Society at the recent great International Potato Exhibition.

PLANTS AND BULBS.

N. Helianthus multiflorus, fl. plen. Golden Sunflower.—A hardy perennial plant of great beauty, grows about four feet high and bears a profusion of rich golden-yellow flowers of the size of Dahlias.

O. Polyantha Rose, Mad. Cecile Brunner, the Fairy Rose.—This is an entirely new class of Roses, of dwarf habit, with bright flowers of exquisite fragrance; hardy and effective.

P. "Curiosity," a new early flowering Pompon Chrysanthemum, with brilliant, deep-bright crimson flowers tipped with golden yellow. This choice variety just introduced here is not for sale, but is offered only as a present to our subscribers.

Q. Clematis coccinea (Scarlet Clematis).—One of the most desirable climbers for covering verandas, trellises, arbors, screens, etc., as it grows from eight to ten feet in one season. Its coral-red flowers are produced in great profusion.

R. Eraldia Japonica zebrina.—A remarkably handsome variegated grass, perfectly hardy, growing to a height of six to seven feet, and producing tall, elegant plumes, highly ornamental for vases.

S. Lilium Wallacei, recently introduced from Japan. Flowers four to six inches in diameter, of clear buff-orange color, distinctly spotted with numerous black dots. The bulbs small, but perfectly hardy.

T. Amaryllis Tyndali, the Fairy Lily.—A delicate, pure-white flower, two to three inches in diameter, borne on slender stems 5 to 6 inches high. Suitable for the garden or house.

U. Strawberry, the Prince of Berries.—3 plants. For complete description and life-size illustration of this really superb Strawberry, see AMERICAN GARDEN, August number.

For other Premiums see General Premium List, mailed free on application.

"ONE CENT WELL SPENT!"

AMERICAN GARDEN PREMIUM LIST.

Very Desirable, Useful, and Excellent

PREMIUMS

INCLUDING

A VALUABLE PRESENT...FREE to Every Subscriber to The American Garden.

SIXTY MOST VALUABLE ARTICLES, all of guaranteed, first-rate Quality, including many wanted in every Home, and by Every Person, Young or Old. Read the Descriptions in the Premium List.

FINE PRESENTS for HOLIDAYS, and all other days; for Wedding Gifts, and to Friends.

(See Premium List.)

DELIVERED TO YOU, FREE, no matter how far off the Good Articles in the Premium List will be delivered, CARRIAGE PREPAID, to any place in the United States or Territories, however near or distant, whether given as premiums, or supplied at the prices named.

The articles not offered "delivery free" will be carefully packed without charge, and forwarded by express or otherwise, as may be desired. The expenses of carriage will not be great. They can be taken at the office of AMERICAN GARDEN without expense.

GOOD THINGS TO BUY. Aside from any articles obtained free as premiums, almost every one will need, or desire to purchase some of the EXCELLENT THINGS described in the Premium List when they can get them of GUARANTEED QUALITY, and from a RESPONSIBLE SOURCE, and at the LOWEST PRICE they can be obtained anywhere of such excellence. A Price is therefore named with EACH article at which we will supply it delivered FREE, or otherwise, as above provided.

ENTERTAINING AND INSTRUCTIVE READING.—See in the Premium List what is said about "Dips," an amusing scene; six "Watch Items," especially the 7th; about "Washing Made Easy;" "Microscopes;" and a score of other things.

This reading will interest you, aside from what is said of the particular things referred to.

A DOLLAR an HOUR can easily be secured by many persons, LADIES included, (also by BOYS and GIRLS), thus: Show to friends and neighbors a specimen copy of the American Garden, its beauty and usefulness, and low cost. An hour's time should suffice to get 2, or 3, or 4 to take it. This will give you a dollar's worth, or MORE, of the valuable articles in the Premium List—articles better than their money cost. Why! it would pay many persons to continue this as a constant employment, and sell the premium articles received when not needed by themselves. N. B.—Any Premium club may contain subscribers from many Post-Offices.

ALSO NOTE, that in addition to your premium you can offer to every subscriber a FREE Premium, as noted in preceding column. (Several of these Seed and Plant parcels will be worth a full Dollar, or more, leaving the Journal free.)

THE AMERICAN GARDEN is a Large, Beautifully Illustrated Journal, printed on fine paper. It is especially devoted to GARDENING, FLOWERING, Fruit Culture, and to Horticultural interests generally. It is of GREAT VALUE in every Garden or Lawn, on the Farm, in the Village, or in the City. The Editors and Contributors are men who write and speak from their own large daily experience and observation. LADIES will find it especially useful in caring for their Flowers and Plants indoor and outdoor. (The Garden is by far the best paying plot on the farm, and adds immensely to the comfort and healthfulness of the home table. THE AMERICAN GARDEN will add many dollars to the products of even the smallest plot.)

Attention is invited to the Border of the first page of this Premium List giving a few of the multitude of similar voluntary expressions, coming from those who are and have been its readers for years past. The Editors and Publishers pledge themselves to make THE AMERICAN GARDEN increasingly valuable by their most earnest efforts, by additional assistance, and by Liberal Oudlay for Illustrations, gathering information, etc., etc.

TERMS—One Dollar a year, Mailed Free. This includes the valuable parcel of Plants, Seeds, etc. See preceding column. 3 months' trial trip, 30 cents. Single number, 10 cents. Sample copy and Premium List FREE. Ditto, with colored plate, 10 cents.

\$6 WATCH FREE TO AGENTS FOR **SPENCE'S BLUE BOOK,** A Perfectly Sedimentless **ULTRAMARINE BLUING** NOTHING LIKE IT. NOTHING EQUAL TO IT.

All bottled or liquid Bluings are bad because of their greenish tint; and all solid or ultramarine Bluings (except Spence's Blue Book) are worse, because they are absolutely and wholly insoluble, and hence throw down a sediment which spots, blurs, and muddles the clothes. But **SPENCE'S BLUE BOOK** makes a bluing which is of that most beautiful of all blue colors, the ultramarine, and is, at the same time, perfectly soluble; hence it does not settle or throw down the least particle of sediment. Nothing more can be desired. It is just simply perfect. "One lady, as soon as she saw the Blue Book Bluing dissolved in a tumbler of water, threw all her old Bluing out-of-doors."—*L. Appleton, Lowell, Mass.* "It sells like hot cakes. The ladies go nearly wild over it."—*J. P. Welch, St. Charles, Ky.* A **\$6 SWISS WATCH**, stem-winder and setter, and large and liberal profits given to agents for **SPENCE'S BLUE BOOK.** Terms and Circulars free. Sample mailed for 25 cents in Stamps, Silver, or Postal Note. **PAYTON SPENCE,** 139 East 16th St., New-York.

\$5 PER VOLUME will be paid for *The Dial*, 1842; *Torvaldson*, 1843; *Peter Parley's Universal History*, 1837; *Fushinawo*, 1828; *Legends of New England*, 1831; *Liberty Tree*, 1841; *My First Cheat*, 1840; *Tamondan*, 1827; *At Afloat*, 1829; *The Raven*, 1845; *Moll Pitcher*, 1832; *Mog Mogog*, 1830; and liberal prices for other first editions of Emerson, Hawthorne, Poe, Longfellow, and Whitier. A Good Microscope Free! Useful to Everybody! The publisher of the well-known and popular *Literary and Family Paper*, *The Crocker*, on the *Hearth*, wishing to secure 100,000 new subscribers for the next three months, and believing that all who subscribe will be so delighted with the paper that they will thereafter renew their subscriptions for the balance of the year now makes the following unprecedented offer: Upon receipt of only **Twenty-five Cents** in postage stamps, we will send **The Crocker on the Hearth** for **Three Months**, and to every subscriber we will send free, our **New Botanical Microscope**, one of the most valuable and useful instruments ever offered. This Microscope has a lens of great magnifying power, and is adapted to the examination of every minute object, making the smallest insect appear quite large, shows curious objects dispersing in a drop of water, enables you to detect counterfeit money, distinguish gold from bad gold, etc., etc. It is made of glass, with brass trimmings, is furnished with specimens, and is a first-class Microscope in every respect, and will be found very useful, while providing endless amusement for old and young. Has always been sold at 50 cts. to \$1.00; hence it will readily be seen what an extraordinary offer we make when we give one absolutely free to every three months' trial subscriber to our paper. **The Crocker on the Hearth** is a mammoth 16-page 61-column illustrated paper, filled with charming Serial and Short Stories, Sketches, Poems, Useful Knowledge, Reading for the Young, Wit and Humor, and everything to amuse, entertain and instruct the whole family. You will be delighted with it, as well as with the valuable premium we offer. Remember, we send this splendid Microscope, packed in a handsome wood case, free to the sending 25 cents for a three months' subscription to our paper. Five subscriptions and five Microscopes will be sent for \$1.00. This great offer is made solely to introduce our paper; take advantage of it at once. **Satisfaction guaranteed or money refunded.** As your retailer, we refer to any publisher in New York. Address, **S. H. BROWN, Publisher, 3 Park Place, New York.**

HAMMOND'S SLUG SHOT,

AN INSECTICIDE AND FERTILIZER Ready for use and safe. **GUARANTEED TO DESTROY**

Potato Bugs, Chinch Bugs, Rose Bugs, Slugs, Aphis Lice, Worms, Caterpillars, and the Striped Bug upon Melons, Cucumbers, Squash and all insects injurious to Grape Vines, Cabbage, Tobacco, Cotton, or Egg Plants, Currants, Fruit or Ornamental Trees, Rose Bushes, and all Shrubs, Greenhouse, and Hardy Flowering Plants.

SLUG SHOT was prepared at first solely to destroy the Potato Bug in gardens, but its valuable properties for the destruction of all kinds of insects, caterpillars, and other vermin, have induced the inventors to manufacture it on a large scale, by which it is offered at a reduced price (as cheap or cheaper than Paris Green), and always of uniform strength, and ready for immediate use without the trouble of mixing. **SLUG SHOT** contains, in minutest quantity, **POISON!** destructive to all insect life, which is most thoroughly diffused through natural and chemical fertilizers, and kills the bug in all stages of its growth. The insect eats it in the minutest quantity, and then appears to become paralyzed, often dying on the leaf without falling to the ground. It is an impalpable powder, and does not harm vegetation; on the other hand, it is a manure. *Dust it on the plants plentifully, either by hand or with a dusting-tin* You can easily make a dustor by taking an old fruit can, perforating the bottom, and nailing the can to a stick.

QUANTITY TO AN ACRE.

When plants are small, about 20 pounds are needed; or, take a handful and throw it over each hill, covering the leaves. It does no harm to plants, but, on the contrary, invigorates them greatly. The color and odor of **SLUG SHOT** prevent it in any way being mistaken or used for wrong purposes, and its composition is such that it is out of the question for a human being or quadruped to take enough to do any harm. Mr. Hammond, the originator, and his men have worked days and weeks in it without any ill effects whatever. Pamphlets, giving a full description, with directions for use and certificates from those who have used it for the various purposes for which it is recommended, mailed free to all applicants. **SLUG SHOT** is in strong, neat packages, properly labeled, weighing respectively 5, 10, and 15 pounds each. These packages are packed in barrels for the trade. The barrels will hold from 200 to 215 pounds net. Each barrel has a large poster and 100 circulars. The price is a half cent less per pound when ordered in bulk than it is in packages. Prices, in packages, 5 lbs. 30 cents; 10 lbs. 50 cents; 15 lbs. 75 cents; in barrels in bulk, 4 1/2 cents per pound. **Slug Shot** cannot be sent by mail. *Prices to the trade given upon application.*

Manufactured by **B. HAMMOND & CO. Mt. Kisco Paint Works, Mt. Kisco, N. Y.** **B. K. BLISS & SONS, Wholesale Agents,** 34 Barclay Street, New-York City.

PATENTS Hand-Book FREE.

"ELLIS'S HORSE REMEDIES ARE THE BEST."

Solidly indorsed by the "Spirit of the Times," and Leading Veterinary Surgeons.

"ELLIS'S SPAVIN CURE.—Of course it is generally regarded as impossible to completely cure a horse spavin and remove the enlargement; but it is positively astonishing what curative properties exist in the mixture known as Ellis's Spavin Cure, and those who have given it a fair trial say it is the best remedy that they ever applied. In many cases it has not only removed the lumpiness, but also the lump, and we recommend it as far superior to the ordinary blisters prescribed by the faculty. We also learn that Ellis's Condition, Colic, Worms, and Heave Powders are the best of their kind, and just what every horse owner should have at hand ready for use."—May 12, 1883.

"I would gladly recommend your Spavin Cure to all with perfect confidence as to the result," writes H. C. Perry, V. S., Boston.

"We believe Ellis's Horse Remedies to be the best articles in the American market."—Strauss & Uman, East 24th Street, New-York City.

Sold by all Druggists and Harness Dealers. Our \$5 and \$10 assortments of Ellis's Horse Remedies should be in every stable. Send for free book of testimonials, describing all our specialties.

\$500.00 IN PREMIUMS

Offered for the Largest Yields of

PRINGLE'S NEW CEREALS, From One-Quarter Acre of Ground.

PRINGLE'S AMERICAN TRIUMPH OATS.

This is a cross between the Excelsior and Waterloo Oats, combining in a remarkable degree the excellent qualities of both. The average height, as the grain stands in the field, is six feet, yet the straw is so strong and firm that it holds up well, without lodging, the tall, luxuriant heads filled with plump, heavy grains. The quality and productiveness of the grain are unequalled, yielding from 60 to 100 bushels per acre, according to the condition and state of fertility of the land. Prices: By mail, \$1.00 per lb.; 3 lbs., \$2.50, post-paid. By express, at purchaser's expense, per peck, \$4.00; bush., \$12.00.

PRINGLE'S ADAMANT SPRING WHEAT.

In this beardless variety we have one of the hardiest and most flinty varieties in cultivation, very productive, hardy, and vigorous. Straw yellowish-white, very stiff and erect, averaging 4 feet in height. For cultivation in North-west, Colorado, and the Pacific coast, where hard wheat is the favorite soil, we are confident that this will be particularly desirable. Prices: By mail, \$1.00 per lb.; 3 lbs., \$2.50, post-paid. By express, at purchaser's expense, per peck, \$4.00; bush., \$12.00.

PRINGLE'S GREEN MOUNTAIN SPRING WHEAT.

This is another beardless variety of great promise. It has been grown for the past two years by one of the most experienced wheat cultivators in Northern Vermont, in close proximity to the Green Mountains, who pronounces it the best he has ever grown. The straw averages about 4 feet, light yellow, very strong, and free from rust. Heads average 4 to 5 inches in length, somewhat tapering; kernels white, large, and plump. Very hardy and productive. Prices: By mail, \$1.00 per lb.; 3 lbs., \$2.50, post-paid. By express, at purchaser's expense, per peck, \$4.00; bush., \$12.00.

The above varieties were first offered by us last Spring, and were extensively grown throughout the country during the past season, and furnished ample proof of their excellence and superiority over the other varieties. To induce as extended a trial as possible, we offered liberal premiums to those who produced the can be accomplished by superior seed and good cultivation. The result is marvelous and shows what Oats produced 168 lbs., Admant Wheat, 108 lbs., and Green Mountain Wheat, 71 lbs., each, from one ounce. The full report of the awards will appear in our Novelty Sheet, published in February, and will be found of interest, as some valuable information and suggestions about grain-growing are given. A copy will be mailed to all applicants.

NEW VARIETY SPRING WHEAT FOR 1884.

Pringle's Invincible is a beardless variety of remarkably robust and vigorous growth; the straw is strong, stiff, well glazed, healthy, and stands up well in all kinds of weather. The heads are four to five inches long, wonderfully prolific; a bushel will easily produce fifty to seventy bushels, if properly cultivated. To obtain ample quantity, the grain ripens quickly and remarkably evenly; care should therefore be taken not to let it be broken and without, we do not hesitate to recommend this new wheat in highest terms to every wheat grower, and prove second to none for milling purposes. Price, \$1.00 per lb.; 3 lbs., \$2.50, by mail, post-paid. By express, at purchaser's expense, per peck, \$4.00; bush., \$12.00. Descriptive circulars, with full particulars, except the seed must be bought of us this Spring.

NEW PANSY—BLISS'S PERFECTION.

AWARDED A FIRST-CLASS CERTIFICATE BY THE NEW-YORK HORTICULTURAL SOCIETY IN THE SPRING OF 1883.

Our previous efforts to improve this ever-popular flower, although attended with unprecedented success, are eclipsed by a new strain, BLISS'S PERFECTION, that we now have the pleasure of introducing, believing it to be the nearest to perfection of anything yet offered. In the colored frontispiece of our Hand-book, our artist has attempted to reproduce some of the types of this strain, but, beautiful as are these illustrations, we assure you that the originals far surpass them, and the copies, instead of being exaggerated, convey but a faint idea of the perfection of form and exquisite delicacy of shading in the flowers themselves. For variety of markings, beauty of form, large size, good substance, and splendid satiny texture, BLISS'S PERFECTION PANSY is unequalled.

Per packet (50 seeds), 50 cents; 5 packets for \$2.00.

Bliss's Illustrated Potato Catalogue.—Contains a list of 500 varieties of Potatoes, embracing new and very promising varieties, with explicit directions for culture, and much other valuable information respecting this indispensable esculent. 10 cents.

NEW TOMATO.

THE CARDINAL.

This new Tomato has been carefully cultivated and subjected to many tests during the past year or two, and has maintained a remarkable perfection in all that can be desired in a Tomato. It is of vigorous growth, yet comparatively compact in habit, and, weight of fruit considered, is the most productive variety known. The fruit is perfect in shape, being uniformly smooth and free from ridges, and is of a brilliant cardinal-red. Although fewness of seeds is a claim made for every new Tomato, it is a fact that by actual weight and measure tests THE CARDINAL has at least one-third less seed than the very best of the other varieties, and the thickness of pulp is most remarkable. It gives promise of being a good shipping sort, as ripe fruits picked in midsummer have kept in fine condition for ten days. The decided points of merit as described puts THE CARDINAL ahead of all other Tomatoes. Were it not so, there would be no need of adding another to the already large list of varieties.

Per pkt. of 30 seeds, 25 cents; 5 pkts., \$1.00.

Randolph's Hand Seed-Sower.

For sowing all kinds of small Garden Seeds with accuracy and dispatch. It is easily operated by a lady or a child of ordinary intelligence, with a little practice. Its cost is trifling compared with the advantages resulting from its use. The sowing is done and seeds will undoubtedly repay the outlay in the planting of a single week. Its construction is so simple, that it is not liable to get out of order.

Descriptive Circulars mailed to all applicants. Price, \$1.25 each. Sent by mail, post-paid to any address, for \$1.50.

A liberal discount to agents.

A NEW WATER-MELON—AMERICAN CHAMPION.

FIFTY DOLLARS IN PREMIUMS.

WATER-MELON—AMERICAN CHAMPION.

"They carry splendidly; the specks, ribs, and breaks are much below the average." "In keeping quality there is no other kind to approach it." "Although the market was very dull, these were engaged several days ahead, at advanced prices." After hearing these endorsements from men who are first authorities in the fruit trade, it will be evident to every one that no other variety combines so many valuable qualities as the American Champion. Price, 25 cents per packet; 5 packets for \$1.00.

FIFTY DOLLARS IN PREMIUMS,

To be awarded as follows:—\$25.00 to the grower of the largest American Champion Water-melon; \$15.00 to the grower of the second largest; and \$10.00 to the grower of the third largest. All reports, which must be signed by three witnesses and sworn to before a justice, to be sent us by October 15th, 1884, and on November 1st the cash will be forwarded to those entitled to it. We reserve the right of ordering the prize-winning Melons shipped to us, for exhibition, expenses of transit to be defrayed by us.

BLISS'S AMERICAN WONDER PEA.

The Earliest Dwarf Wrinkled Pea in Cultivation.

BLISS'S AMERICAN WONDER PEA.

Extra early—requires no blanching—exquisite flavor. The best variety for forcing under glass, and the best for early sowing in the garden. This splendid variety is the result of a cross between the Champion of England and Little Gem, and combines all the good qualities of both of its parents, with the additional ones of superiority in flavor to the Champion and of greater productiveness than the Little Gem. Peas are ready for the table in thirty-three days from date of planting. Thirty to forty pods have been counted on some vines, and nine large peas in some of the pods, and every pod is well filled. The vine grows from eight to ten inches high, according to the soil and season.

After a more extended trial than any previous introduction was ever subjected to, Bliss's American Wonder Pea has been pronounced by press and public the most desirable wrinkled variety in cultivation, while, in point of quality, the best horticultural judges in the world maintain that it is surpassed by no other variety.

CAUTION.—Each succeeding season the necessarily becomes greater of cautioning the public against spurious American Wonder peas. We have on different occasions secured several packets from dealers who claimed to supply the genuine Bliss's American Wonder Pea, which, upon trial, proved to be entirely unlike it. We are within the mark when we say hundreds of bushels of other than the genuine variety have been sold. As there seems to be no protection from such fraud, it is to your interest to procure a supply from headquarters; for unless you obtain the GENUINE Bliss's American Wonder, you will never know why it is that, wherever grown, it has been pronounced by all the earliest, the most productive, and best-flavored variety in cultivation.

Per pkt., 10 cents; pint, 40; quart, 75 by mail, post-paid. When delivered at our store or sent by express at purchaser's expense: pint, 30 cents; quart, 50; peck, \$2.50; bushel, \$8.00. Prices for larger quantities on application.

Voluntary Testimony in favor of Bliss's American Wonder Pea.

From Rev. Henry Ward Beecher.—"Your peas are wonderful, none others so good. I do not mean to plant another year any others, early or late. They beat the Alpha in earliness, and out of sight in flavor." From Hon. Marshall P. Wilder, Pres. American Pomological Society, Ex-Pres. U. S. Agricultural Society.—"My AMERICAN WONDER is a wonder, equal in sweetness and richness to the Champion of England, which is all that could be desired."

NEW EARLY RHUBARB—"PARAGON."

This variety, although now offered for the first time in this country, has had extensive trial in England, and has more than verified the claims made for it. It is unquestionably one of the finest varieties of Rhubarb ever offered, being the earliest of all and wonderfully prolific. The crowns and stalks are produced in such profusion that more than twice the weight can be gathered from "PARAGON" than from any other sort. It has also the qualification over all others that IT NEVER SEEDS, a claim that we have tested and found well sustained last Summer. The leaves are remarkably small, while in color the stalks are a beautiful bright red, and in flavor unsurpassed. Price, strong plants, 75 cents each; \$7.50 per dozen.

New Varieties Potatoes.

Tremont, Mayflower, Iroquois, Charter Oak, Dakota Red.

Choice Varieties of 1883, etc.

Rosy Morn, Rubicond, Early Sunrise, Tyrian Purple, Garfield, Rural Blush.

For description and price of the above, send for our Illustrated Potato Catalogue, 48 pages, which contains an illustrated list of the leading varieties in cultivation, with much useful information upon their culture. Mailed to all applicants inclosing 10 cents. Regular customers free.

For further description of above and other Novelties, see our HAND-BOOK FOR THE FARM AND GARDEN (mailed for 6 cents to cover postage). Purchasers ordering seeds to value of \$5.00 in one order, will be entitled to a copy of THE AMERICAN GARDEN for one year.

MT. HOPE NURSERIES, ROCHESTER, N. Y.

EVERGREENS and SHRUBBERY,
Tree Seeds and Seedlings.
HEAVY STOCK - LOW PRICES - FREE CATALOGUE.

J. JENKINS NURSERY,
Winnon, Columbiana Co. Ohio.

A Descriptive Illustrated Nursery Catalogue, and Guide for the Fruit and Ornamental Planter, sent to all applicants.

WM. H. MOON, Morrisville, Pa.

MARLBORO RED RASPBERRY. Send to the original and terms. **A. J. CAYWOOD & SON,** Marlboro, N. Y.

Foreign Grape-Vines
FOR GRAPERIES.
ORNAMENTAL FOLIAGE PLANTS,
Greenhouse Plants, Bedding Plants.
Catalogue mailed on application.

DAVID FERGUSSON & SONS,
Ridge and Lehigh Aves. Philadelphia.

CARNATION PINKS.
Rooted Cuttings in great numbers, and the varieties most profitable for the trade in Cut Flowers, now ready. Send for a circular. The usual large stock of florists of this popular flower and Smilax is also offered.

THOS. F. SEAL,
Unionville, Chester Co. Pa.

HANSELL The earliest and most valuable Raspberry, Early Harvest Blackberry, Atlantic and Baked Boone Strawberries, sent for details. The largest and best stock of **SMALL FRUITS** in the United States, including all valuable varieties, new and old. Richly illustrated catalogue, telling what to plant, how to plant, and how to get and grow Fruit Trees and Plants, filled with useful information on fruit culture, free. Address, **J. T. LOVETT,** Little Silver, New Jersey. Introducing Cuthbert Raspberry and Manchester Strawberry.

NEW GOOSEBERRY
We now offer for the first time a very valuable new variety. Circular giving full description and price, together with a handsome colored plate, free. Address, **ELLWANGER & BARRY,** Mount Hope Nurseries, Rochester, N. Y. Mention this paper.

HYBRID CLEMATIS.
The most Beautiful of all HARDY CLIMBING PLANTS. Strong Roots can be sent safely by mail. Send for our Illustrated Catalogue.

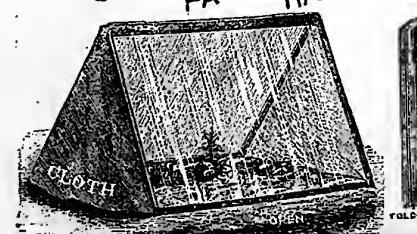

JOSEPH KIFT, West Chester, Pa.

WILD FLOWERS For cultivation: Orchids, Lilies, Ferns, Alpine, etc. Catalogue sent.

EDWARD GILLET, Southwick, Mass.

TREES. EVERGREEN and FOREST TREE SEEDLINGS in unlimited quantities. **LARGE SIZE STOCKY EVERGREENS,** all from two to six feet high, at one-half the prices charged by others. Catalogue free. **GEO. PINNEY,** Sturgeon Bay, Wis.

ST. JOHNS PATENT HAND GLASS.

FOR FORCING AND PROTECTING EARLY AND TENDER PLANTS.
Upward of ten years' practical use has proved it the most economical and effective appliance ever offered for the purpose. \$4.50 per doz., \$30.00 per 100. For sale by seedsman and dealers in agricultural implements.

ST. JOHN HAND-GLASS CO.
P. O. Box 1661. New-York City.

GRAPES. First-Class Stock. **BERRIES.** All Leading Varieties.
EVERY AMERICAN GARDEN SHOULD HAVE THE BEST. DISTANT CUSTOMERS CAN OBTAIN A SUPPLY BY MAIL, SAFELY AND CHEAPLY.
Head-quarters for the **MONTCLAIR RASPBERRY.** Fine stock of **JAS. VICK, JERSEY QUEEN, MANCHESTER,** and other Strawberries. Send for Price List.

E. & J. C. WILLIAMS, Montclair, N. J.

RARE FLOWERS, 14 Choice Bedding Tree, or House Plants. Newest Varieties. Price, \$1.00. **LARGONUM, PUGILIAS, GERANIUMS, &c.** Cut Geranium flowers. Catalogue free. Send for it.

W. H. Spangler, Jr., Mount Delight, N. H.

TREES Twenty varieties of Evergreens and Forest trees. Millions of seedlings at 75c. to \$10 a 1000. Fine, large Stocky trees cheap.

EVERGREENS. Very low rates to large planters. Catalogue free.

GEO. PINNEY, Sturgeon Bay, Door Co., Wis.

MATTHEWS' SEED DRILL
The Standard of America. Admitted by leading Seedsmen and Market Gardeners everywhere to be the most perfect and reliable Drill in use.

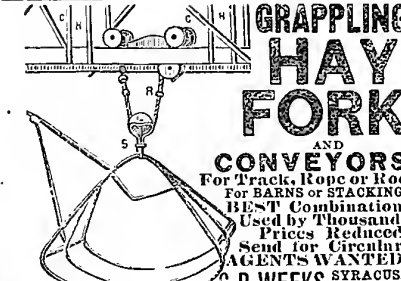

Also:
MATTHEWS' HAND CULTIVATOR, MATTHEWS' WHEEL HOE, MATTHEWS' DRILL CULTIVATOR AND HOE COMBINED.
Comprising the best line of implements for planting and cultivating garden crops to be found in America. Send for circular showing latest improvements and latest prices. Made only by

SUGAR MILLS
Eighty Sizes, Hand, Animal, Steam and Water Power. The Best. The Cheapest. Thousands in use throughout the Tropical World and by all the leading Sorghum growers of the West. Catalogues and Prices, and Prof. W. H. WELCH & SONS' Northern CANE MANUAL sent free by **GEO. L. SQUIER,** Buffalo, N. Y.

CENTENNIAL-TIFFANY BRICK & TILE MACHINES receive the HIGHEST AWARDS wherever exhibited. THE LATEST & BEST. Send for circulars of Stone Separating Crushers, Engines and full Tile Factory outfits to **FREY, SHECKLER & HOOVER,** Bucyrus, Ohio.

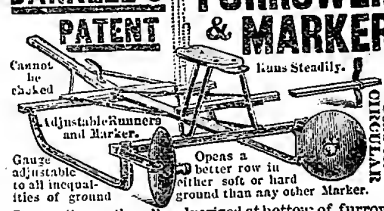

BUCKEYE JUNIOR AND SENIOR Lawn Mower. Strong and Durable. EASY TO WORK. Most Reliable MOWER IN USE.

Try one and you will buy it. Also manufacturers of the Iron Turbine Wind Engines, Buckeye Force Pumps and Buckeye Iron Fencing. Send for Illustrated Circulars to **MAST. FOOS & CO.,** Springfield, O.

DARNELL'S PATENT FURROWER & MARKER
Opens a better row in either soft or hard ground than any other Marker. Leaves the earth well pulverized at bottom of furrow. Marks any width from 2 1/2 to 5 feet, and from a mere mark to 6 inches deep. "Take pleasure in recommending it. It does the business; is well made and will last for years." **J. S. Collins, Moorestown, N. J.** "It far exceeds my expectations. If the real merits of this cheap implement were known to potato growers alone, the sales would be immense." **B. L. Cox, Erie, Wash. Co. (N. Y.) Agr. Society** would be immense.

H. W. DOUGHTEN Manufacturer, Moorestown, Burlington Co., N. J.

FRUIT DRIER. PAMPHLET SENT FREE. **Deitz Automatic Fruit Drier.** **DEITZ MAN'FG CO.** Chambersburg, Pa.

CRAZY PATCH WORK
How to Make It; how to obtain the silk for it. We send Ten samples of elegant silks, all different and cut so as to make one 10-inch block of Crazy Patchwork for 25 cts.; 12-inch block, 35 cts.; with diagram showing how it is put together. We send 20 perforated patterns, working size, of birds, butterflies, lugs, beetles, bees, spiders and webs, etc., etc., and 10 sprays of flowers of various kinds, all for 60 cts., with powder and distributing pad for transferring, to ornament the silk. These patterns can be instantly transferred to any material, and can be used a hundred times over. Our book, "How to Make Home Beautiful," has instructions for making a variety of patchwork, with diagrams and illustrations of the silk. Also, has instructions for doing this kind of embroidery and for making many beautiful and useful articles. It also contains a descriptive and illustrated list of nearly 1,000 patterns for various kinds of embroidery. Price, 15 cts. All the above, with ten varieties of silk for 10-inch block, 90 cents; with silk for 12-inch block, \$1.00, with silk for both blocks, \$1.10, all post-paid.

J. L. PATEN, 47 Barelay St., New York.

CLUB ORDERS.

TEA CLUB ORDERS.
 We have made a specialty for seven years of giving away as Premiums, to those who get up clubs for our goods, Dinner and Tea Sets, Gold Band Sets, Silverware, etc. Teas of all kinds, from 25 to 75 cents per pound. We do a very large Tea and Coffee business, besides sending out from 75 to 90 CLUB ORDERS each day. SILVER-PLATED CASTERS as Premiums with \$15, \$27 and \$10 orders. WHITE TEA SETS with \$10 orders. DECORATED TEA SETS with \$15. GOLD BAND or MOSS ROSE SETS of 44 pcs., or DIN-NER SETS, of 108 pcs., with \$20 orders, and a host of other Premiums. Send us Postal and mention this Paper, and we will send you full Price and Premium List. Freight Charges average 75 cents per 100 lbs., to points West. GREAT LONDON TEA CO., 805 Washington Street, Boston.

THE MAPES MANURES
 ON
CABBAGES, CAULIFLOWERS, ONIONS, ETC.

Oats, Corn, &c.

Oats, eighty-one bushels per acre. Cauliflower, 181 barrels per acre. Potatoes, 275 bushels per acre, etc. Five years' experience with the Mapes Manures.

W. H. TUTHILL, Mattituck, L. I., reports through S. P. TUTTILL:
 "I have used the Mapes Manures for five years, and cannot but speak in the highest terms of the results obtained with them. The following are some:
 With 400 lbs. per acre for Oats, yield 81 bushels per acre.
 " 1,400 " " Potatoes, " 181 barrels "
 " 1,500 " " Cauliflower, " 100 bushels "
 " 500 " " Corn, " "
 " Had a splendid crop of hay. I had about an acre of ground that looked very bad in the spring; I put on 200 lbs. of the Mapes Spring Top-dressing, and had four large loads of very fine hay from the ground.
 " My wheat went thirty-seven bushels per acre."

Onions—502 Bushels on One-half Acre—Very Large Profit.

Extract from Rural New Yorker, November 24, 1883.
 C. H. Pease, of South Windsor, Conn., has raised this season 496 bushels of onions from one-half acre of ground, at a cost of \$100, and his profit is \$239.

C. H. PEASE, South Windsor, Conn., December 18, 1883, writes in reply to request for particulars:
 "The following is a correct account of the expenses and proceeds of one-half acre of onions:

400 lbs. Mapes' Onion Manure.....	\$12.50
3000 " Tobacco stems.....	16.00
30 bushels ashes.....	7.50
Seed.....	2.00
Plowing and rolling.....	1.50
Sowing.....	22.25
Hoeing and weeding.....	23.00
Harvesting.....	7.50
Interest on land.....	
Total expense of crops.....	\$101.45
Yielded 502 bushels of onions, that averaged me 70 cents per bushel, or....	\$351.40
A profit of.....	\$249.95."

Send postal for forthcoming pamphlet, containing reports from practical, well-known TRUCK, FRUIT, AND SPECIAL CROP GROWERS. Many of these growers use twenty tons and upward of the Mapes Manures in a season. Address

THE MAPES FORMULA AND PERUVIAN GUANO COMPANY,
 158 Front Street, New-York.

"ACME" PULVERIZING HARROW,

Clod Crusher, and Leveler.
 AGENTS WANTED.
 It is the best selling tool on earth.

The "ACME" subjects the soil to the action of a Steel Crusher and Leveler, and to the Cutting, Lifting, Turning process of double gangs of CAST-STEEL COULTERS, the peculiar shape and arrangement of which give immense cutting power. Thus the three operations of crushing lumps, leveling off the ground, and thoroughly pulverizing the soil are performed at the same time. The entire absence of Spikes or Spring Teeth avoids pulling up rubbish. It is especially adapted to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that cuts over the entire surface of the ground.

We make a variety of Sizes working from 4 to 15 Feet Wide.
DO NOT BE DECEIVED. Don't let your dealer palm off a base imitation or some inferior tool on you under the assurances that it is something better, but **SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL.** We will send the double gang Acme to any responsible farmer in the United States on trial, and if it does not suit, you may send it back, we paying return freight charges. We don't ask for pay until you have tried it on your own farm.

Send for Pamphlet containing Thousands of Testimonials, from 46 different States and Territories.

The American Garden

A Monthly Journal of Practical Gardening.

DR. F. M. HEXAMER, Editor.

B. K. BLISS & SONS, Publishers.

Vol. V.

NEW-YORK, MAY, 1884.

No. 5.

Copyright, 1884, by B. K. BLISS & SONS.

THE LILAC WALK.

Written for the American Garden.

Late, late in May,
When every lane a blossom shows,
And every brier a budded Rose,
When Service berries on the hill
Shake out a snowy plume,
When sings the thrush to wake the day,
To greet the night, the whip-poor-will,
When Poppies redden on the stalk,
The Lilacs lift above the walk
Their pyramids of bloom!

Late, late in May,
When lonely northern fields and woods
And winter-wasted solitudes
Are loosened in a blissful heat
And flooded with perfume,
The tardy Lilacs, bare and gray,
The ancient Lilacs, slow and sweet,
Burst in a green, delicious mist
And lift in melting amethyst
Their pyramids of bloom!

DORA READ GOODALE.

The Vegetable Garden.

SEASONABLE HINTS.

Aeration of the Soil.—Many persons suppose that the main object in spading or plowing the ground is to cover the fertilizers and to prepare a smooth seed-bed, while they overlook entirely the very important action of aeration. Without sufficient air in the soil the fertilizers applied to the land would remain inert, and the feeding roots would be deprived of considerable material indispensable to the growth of the plants. For these reasons it is of the utmost importance to break up, mellow and pulverize the soil as much as possible before planting and to keep it in an open and loose condition throughout the growing season.

Spading Forks, if not entirely unknown, are used too little in many gardens. In small inclosures where plowing is not practicable, and for the preparation of a perfect seed-bed, a fork is as superior to a common spade, as a saw is preferable to a knife for cutting a log in two. The only difficulty with spading forks is to find a perfect one; most of them are so poorly made that they break under the slightest strain. In buying one take only the best, even at double the cost of a poor one, which is too dear at any price.

Sweet Potatoes.—The generally prevailing idea that Sweet Potatoes can be grown on sandy land only, deters many from attempting to raise this excellent vegetable. There is no doubt that certain sandy soils produce tubers of better quality than others, but if the ground is only thoroughly drained and properly prepared, satisfactory crops may be grown on comparatively heavy soils.

Raising of plants has developed into so considerable an industry that they are now furnished by all seed and plant dealers, and for small quantities it will be found cheaper to buy than to raise them. Those who wish to grow their own plants may easily do so by placing the tubers—generally cut in two lengthwise, with cut side down—in a moderate hot-bed, and covering them with two to three inches of light soil. Half a dozen tubers are enough for a family garden. The sprouts will be fit for planting in about a month from the time of starting them.

The first of June is early enough for planting the sprouts in the open ground. It is not necessary that the soil should be very rich, but it must be well worked and mellowed, especially if of a clayey constitution. In the garden we prefer to plant them in rows four feet apart, and about eighteen inches in the rows. In field-culture, three by three feet is the usual distance of planting.

Sugar Corn.—There is nothing gained by planting Corn before the ground is thoroughly dry and warmed. If planted sooner the seed will frequently rot, and if it should sprout, the growth will be sickly and puny, and inferior to that planted later under more favorable conditions. The chief aim to have in view is to provide a continuous succession of ears fit for use throughout the summer. To secure this, a very early, a medium and a late variety have to be planted at the first planting, to be followed by other plantings of the medium or later kinds every two weeks up to the latter part of July.

LETTUCE—VARIETIES AND CULTURE.

Perhaps no garden plant is more universally grown than the Lettuce. No garden is so small or so large that it can do without its Lettuce bed. We find it as often in the neglected garden of the rude cottager as on the symmetric border of the wealthy amateur. One of the earliest salads of spring, its fresh and tender leaves are always acceptable as a grateful change from the winter bill of

BLACK-SEEDED BUTTER LETTUCE

fare. Perhaps it is this circumstance that makes it so universally esteemed, for it must be confessed that its succulent leaves possess very little nutriment.

Although, like almost all garden plants, the Lettuce thrives best on rich soil; and, with careful culture, it will grow and yield a passable crop in almost any location, provided only that the seed is sown early in the spring,

CURLED BUTTER LETTUCE.

so that the plants may grow during the cool season. Indeed, the Lettuce thrives remarkably well without culture. Last season we fertilized a newly made lawn with compost from a heap on which had been thrown the refuse from the previous summer's Lettuce bed. The result was thrifty plants of Lettuce, that were scarcely behind those from carefully sown seed in the garden plot, ent-

COS LETTUCE.

stripped the grass and weeds. Some of these plants, gathered for the table, were found to be tender and of fine flavor.

This method of growing Lettuce, however, is not to be recommended. It is safe to say that the majority of people who grew Lettuce in the garden never have it at its perfection. It is almost always sown so thick that the plants have but half a chance to develop. Many who saw our fine headed plants of

Lettuce last season, looking like little Cabbages, with their leaves covering a circle a full foot in diameter, remarked that they had never seen such large and finely-headed plants before. The secret of it all is good soil, clean cultivation, and giving the plants plenty of room. The seeds were planted in rows, fourteen inches apart, and the plants were thinned in the rows by degrees, as they were wanted for use, until the last ones were twelve inches apart. Of these large plants a single one was sufficient to supply the family for a meal. It is a gain to thin out Lettuce in this way, because, the later plants having a chance to develop to their full size, furnish a more abundant crop from the bed than if all were left crowded together, so that none could grow as large as they will. Some gardeners think that Lettuce will not head well unless the plants are first sown in a seed-bed and afterward transplanted. Possibly ours might have headed still better had they been grown in this way. But, are headed plants better for use than others, do you ask? Yes, they are better, because the inner leaves, being blanched, are more tender and delicate in flavor than the outer ones. As the plants become large the outer leaves become bitter, while the inner ones remain as tender and sweet as were the outer ones when first fit for use.

The varieties of Lettuce are very numerous, though all may be referred to three general classes: these that have comparatively smooth leaves, with straight margins; those that have crimped and ruffled leaves, and these that have long, pointed, upright leaves. The varieties of the first class head best, though all of these do not form heads; those of the second class are most beautiful in appearance. The third class, the Roman or Cos Lettuces, though much grown in Europe, are not much prized in this country.

Out of about sixty varieties of Lettuce tested last season, we found the French Imperial head, the Deacon, and the Salamander produced the finest heads. The Black Seeded Butter, Golden Stone Head, India Head, and White Cabbage all formed very fine heads.

The most beautiful varieties were Green Fringed and Boston Curled. The first of these has a very finely-ruffled border; while, of the second, the whole leaf is a mass of the most intricate ruffles and convolutions. There are several red varieties, but their color is too dull to be attractive.

Among the earliest sorts were the Tennis Ball, of which there are two varieties; the White Piercing Head, the Prize Head, and Curled Simpson. These were very little in advance of many others, however. Indeed, twenty-two sorts were all called fit for the table the same day as were these. The new American Gathering, Prize Head, and Ferry's Early Prize Head were, to all appearances, the same; also the Curled Simpson seemed the same as the Perpetual, and the Hummersmith Hardy Green was not distinguishable from the Hardy Green Winter.

The Deer Tongue, a new variety, sent out last season, is remarkably distinct. It evidently belongs to the Cos family, though quite unlike the other varieties of this class. It has very long, pointed leaves, which grow nearly upright. In flavor it is very sweet and tender, and with us it retained these qualities until almost all the other varieties were quite bitter.

WATER-MELON RAISING.

I have always done well in raising Water-melons; chiefly, I think, because I had just the ground essential to success—new land, from which timber had lately been removed, and the soil of a sandy, porous character. The decaying roots in ground lately occupied by timber insure perfect drainage, and I consider it next to useless to attempt to raise Water-melons on land not well drained. In the first place, the earliest Melons not only bring the best prices, but are best in both yield and quality, and you can start any crop much earlier on drained than on undrained land; in the second place, although this is a very succulent fruit, wet is mere damaging than drought, although drought is destructive, and drained land is neither so wet in wet weather nor so dry in dry weather as undrained land.

The best soil for Water-melons is, as I have said, a light, dry, sandy one. Such a soil is warm, and the Water-melon requires heat. It is also loose and light, and Water-melons never do well on a compact soil. If a hard rain compacts the ground it will greatly damage the crop. This is another reason why roots in the ground are advantageous—they keep it loose and friable.

A southern slope may be desirable, but I have raised my best Melons on the brow of a very high hill, and better on a northern than on a southern slope; why, I cannot say. It is contrary to what I had anticipated.

The earlier I can plant the better Melons I raise. In this latitude (the fortieth parallel) late planted Melons are liable to shrivel before maturing. Those that do mature lack the delicious flavor of those planted earlier. Melons are much more liable to shrivel and fall off on old land than upon new.

I have settled down to putting the hills not more than six or seven feet apart each way. Put several seeds in a hill; and, when the plants are well up, thin out to one to each hill, of course leaving the strongest and best. I lay off the hills by running furrows with a broad, single diamond plow. I manure well in the hill, using hog manure. Any animal manure will answer, but I consider hog manure the best. Never use stable or other manure not fully rotted; the fermentation is injurious. I have heard a compost of muck and chip-dirt highly recommended, but have never used it. The hill should be broad, and just even with the surface of the land. Drop the seeds and cover them to the depth of a couple of inches; not deeper. This makes the hill, when covered, a couple of inches higher than the surrounding surface. I hoe a couple of times, but, after the vines begin to run, disturb them only enough to keep out the weeds.

If the bugs appear, I sprinkle the plants with soot or very fine wood-ashes, in the morning when the dew is on. This is generally sufficient. At times I have mixed a little lime with the soot.

One hint about marketing: Rub the Melons till clean and bright. People like a nice-looking Melon, and will pay more for, and buy more quickly, a clean, polished Melon, than one dirty and dingy. It is the work of but a moment to rub it clean.

JOHN M. STAHL.

THE AMERICAN CHAMPION WATER-MELON.

Our illustration shows the general appearance of this new variety of Melon, the many good qualities of which recommend it highly for market as well as home use.

It is a cross between the "Rattle-snake" and "Scaly-bark" Melons. It is of very large size, averaging from twenty-five to fifty pounds in weight; shape, oval; skin, dark green, marbled; rind, very thin and firm; flesh, sweet and of best quality; while, in carrying and shipping qualities, it is claimed to surpass all other varieties.

CABBAGE CULTURE.

Vegetables of all kinds require the best of culture to have them tender and succulent, but I do not know of any which require more thorough cultivation nor heavier feeding than Cabbage, Celery excepted. Amateurs and farmers often wonder why the professional gardener can raise Cabbage so much superior to what they can produce with even the best of attention. This is easily explained; their best attention is not thorough

thousands are needed it will be found more advantageous to raise them in a hotbed, as advised in previous numbers of THE AMERICAN GARDEN.

When the two first characteristic leaves are formed, transplant into another bed, about two inches apart each way; do not allow them to get drawn, but give plenty of air on all suitable occasions, to induce a short, stocky growth. Previous to planting into the open ground, have them well hardened off by full exposure night and day. Select a cloudy day for planting; it is not necessary that it be a rainy one, for if the plants have plenty of roots and the ground is well pulverized, there is but little danger of their dying. Keep the soil well stirred around the plants at all times after they are in the open ground, especially after rain; this increases their growth wonderfully.

The young plants are sometimes attacked by a small, black beetle (*Haltica striolata*). Last year they were so numerous and destructive that, in some places, whole fields were completely destroyed by them; all kinds of remedies were applied with but little avail. One of my fields I saved by sowing some old Radish and Cabbage seeds alongside of the plants, to feed the beetles; then gave a good manuring around the roots of the plants with superphosphate of lime, and worked it into the soil. They soon left the large plants for the small seedling, and the stimulating effect of the phosphate made the old plants too large and tough for them by the time they had the smaller ones eaten up; but the smell of the superphosphate in itself seems to be repulsive to this insect pest.

Another insect which we have to contend with is the Cabbage worm. It is generally not so very damaging to early Cabbages as to late ones, owing to the heads of the former getting well hardened up before the butterflies make their appearance. I have tried a good many remedies for this pest, but nothing has been so successful with me as the Persian Insect Powder, dusted on with small bellows. This powder is also good for destroying the aphid which frequently attacks Cabbage during dry weather. But, all considered, the best repellent of all insects injurious to Cabbage is to maintain a strong, vigorous growth by the use of plenty of manure and thorough cultivation.

M. MILTON.

VEGETABLES IN GRAPERIES.

A reader suggests that the ground space in graperies, which he finds generally bare, be used for forcing vegetables. The difficulty in growing vegetables in graperies is that, when the vines start into growth, the interior of the house becomes too shaded for vegetable growing; and previous to this, while the vines are kept dormant, it is too cold.

Tomatoes require a great deal of sun to ripen, and, if they are to be grown in a grapery, we would advise to train them on stakes and cut back the side shoots severely, as, in the shaded position, there will be a strong tendency to develop foliage to the detriment of fruit.

Spinach and hardy Lettuce sown in autumn do very well in graperies.

AMERICAN CHAMPION WATER-MELON.

enough to give that luxuriance of growth necessary to produce large, solid heads.

As early in the spring as the ground is in proper condition, give a good coating of manure, say three to four inches, spreading it evenly over the ground, then plow it in with a heavy furrow, then pulverize well by using some one of the excellent harrows now in use. (The "Acme" is the best.) Unless the soil and manure are well mixed, and the large lumps are well broken up, full benefit cannot be derived. The large lumps of soil contain much plant-food sealed up, and, unless the seal is broken by crushing them by harrowing, relling, or other modes of reducing the soil to a finely pulverized condition, a considerable part of nourishment remains unavailable to the rootlets of the plants.

Early Cabbage, such as E. Jersey Wakefield, should be planted in rows two feet and a half apart, and twenty inches between plants, care being taken to place the plants into the ground to the first leaf. When only a few hundred are to be planted, it is generally cheapest for the amateur to buy his plants of some reliable gardener. Where

The Fruit Garden.

SEASONABLE HINTS.

The lateness of the season has naturally caused the accumulation of a large amount of work to be performed in a very short space of time, and in the haste and hurry it is highly probable that many a contemplated fruit garden has been left unplanted. But those who are really in earnest and will do the work properly may still plant trees and shrubs of nearly all kinds without running much risk of loss. Of course, the later they are planted the more care has to be given to the work and the more severely has the wood to be cut back.

Strawberries may be planted with safety up to the middle of May. In planting thus late it is of great importance to pinch off all the buds and flowers, to keep the roots protected against sun and wind, and to press the soil firmly around the roots. We have planted acres of *Strawberries* in May, without more loss than from those planted a month earlier.

Coal Ashes are strangely undervalued in the fruit garden. Instead of being a nuisance, as which they are generally regarded, they are of great value not only in ameliorating the soil, but as preventives against borers, when spread around *Currant* or *Quince* bushes. Dr. Sturtevant relates that in the garden of Mr. E. J. Swan at Geneva, N. Y., there are extraordinarily thrifty *Currant* bushes, to which coal ashes have been applied for many years, and which have not only been free from the borers, but also from the attack of the *Currant* worm. There are also *Quince* trees of equal thriftiness which have been under like treatment, and in the lawn are a number of *Mountain Ashes*, some of which have been treated with coal ashes and the others have not, and the difference in vigor is extremely well marked in favor of those to which coal ashes have been applied. The ashes for this purpose are heaped up about the stem to a height perhaps of six to eight inches and extending about two feet from the trunk.

Scale Insects are becoming very destructive to fruit trees and are spreading rapidly over the entire country. Kerosene emulsions are the sovereign remedy against this pest. In answer to several inquiries about the mode of preparing emulsions, we give Prof. Riley's directions:

"Emulsions with milk may be made of varying strength, but one of the most satisfactory proportions is two parts of refined kerosene to one part of sour milk. This must be thoroughly churned (not merely shaken) until a butter is formed which is thoroughly stable and will keep indefinitely in closed vessels and may be diluted *ad libitum* with water when needed for use. The time required to bring the butter varies with the temperature, and both soap and milk emulsions are facilitated by heating the ingredients. Ordinary condensed milk may also be used by thoroughly stirring and boiling it in an equal or varying quantity of kerosene.

"The diluted emulsion when prepared for use should be finely sprayed upon the insects to be killed, its strength varying for different insects or plants and its effect enhanced when brought forcibly in contact with the insects."

CULTIVATION OF CURRANTS.

Currant culture, if not entirely abandoned, is neglected to a great extent, owing to the ravages of insects infesting the bushes, and yet a little care will conquer all these.

When the stems are eaten by borers, rendering them hollow, and in many instances causing them to break, trim the bushes in the fall or early spring, and where a hollow stem is found cut away till solid wood only remains. Burn all such prunings. If scale infests the stems, scrape them off, or wash the stems with strong potash water.

For worms that eat the foliage, apply one ounce of powdered white hellebore thoroughly stirred into a pailful of water; sprinkle the foliage with this from a watering-pot. Hellebore is not hurtful to man, and can be used on *Currants* even when fruit is ripe enough to pick, if the fruit is only well washed before using. In the absence of hellebore, hot water, a little hotter than one can bear the hand in, applied to the foliage will kill most of the worms, or, at least, hold them in check until hellebore can be procured.

The *Currant* span-worm, so called from arching its back at every step, is more difficult to kill than any other of the leaf-eating caterpillars. Should it attack the foliage while the fruit is upon the bushes, double or treble the amount of hellebore given above, and apply in the same manner. After the fruit is gathered, should they infest the bushes, use paris green, a tea-spoonful to a pail of water, applied with a watering-can, or apply "slug-shot" dusted over them.

In autumn, after the fall of the leaf, clear up all the litter from around the bushes and burn it, then apply a top dressing of air-slacked lime or potash in some form; wood ashes are especially valuable for this purpose.

This dressing destroys most larvæ of all insects that burrow in the soil near the bushes. Clean culture is a great foe to most injurious insects. Feed your ground with abundance of well rotted manure, and bushes bending under the weight of fruit will be your reward.

J. B. ROGERS.

CARE OF RASPBERRIES.

During late spring and early summer the cultivation of *Raspberries* should be frequent and thorough, for the work will soon have to be discontinued on account of their fruiting. If planted as they should be, in rows five feet apart, the horse cultivator can be used until the fruit is within a few weeks of ripening. This leaves the ground in fine condition; and, in order to keep the rows clean, I put a generous mulching around the plants as soon as cultivation is discontinued. This mulching not only keeps down the weeds but it also prolongs the fruiting season. The roots are kept moist by the mulch, and additional stimulus and nourishment are given to the plant, so that many of the late berries, that would otherwise not ripen, or dry up prematurely, are sustained and brought to perfection.

The same treatment is excellent for all other garden fruits. It is the most effectual way to guard against drought in summer and against frost in winter. It also prevents plants and trees from being starved for want of nourishment; it is, in fact, the most natural way for a tree or bush to get its

nourishment, by filtration from a supply on the surface of the ground.

Raspberry and similar vines should be well supported quite early in the season, that the canes will not break or the weight of the fruit draw them over into the spaces between the rows. Wires stretched along each side of the rows, and supported by stakes, will keep the canes up as well as anything, and are easily put up and taken down. The wires should be supported at short distances, in order to prevent them from sagging where the rows are long. The height of the wires from the ground must, of course, depend somewhat upon the size of the variety grown; for average sized plants they should be placed about two and a half feet from the ground. As the canes grow to the top of the wire they should be spread out in fan shape, and fastened loosely to the wire. If care is taken to fasten them all in this way only one wire to a row would be needed.

Through the growing season the suckers springing up outside of the hill and row should be treated as weeds unless more plants are wanted. After the bearing season is over the old fruiting canes should be cut out and burned, leaving only three or four of the new sprouts. These new canes ought to be cut back to a height of four feet, and the laterals to ten or twelve inches.

For yielding, length of fruiting season, and keeping qualities, the different varieties of *Black Raspberries* are much superior to the *Red*, but in quality and delicacy of flavor they are far excelled by the latter.

The *Turner* for early and the *Cuthbert* for late are the best *Red Raspberries* generally cultivated, although there are many excellent varieties of later date. Of the *Black Caps* I favor the *Gregg*, as being of good flavor, large and very prolific. It is not so early as the *Souhegan* and some other varieties, perhaps, but its fruiting season is longer and later than any other that I have grown.

W. D. BOYNTON.

GRAFTING GRAPEVINE CANES.

In reply to several inquiries about the practicability of grafting the canes as well as the roots, Mr. J. Jenkins, author of the "Art of Propagation," says: "Lay the canes down, cut out the buds at each joint, plunge a knife directly through the nodes, and insert the cions through the joints; the buds having been removed, their places are supplied by the cions or grafts, and cell circulation is soon established. The cions are prepared as for cleft grafting, except that a shoulder is left on either side, which rests on the cut surface of the cane. The cane and the inserted cions are then covered with soil to the upper buds."

PERSIMMONS SUBSTITUTING WHISKY.

The veteran pomologist, Judge Samuel Miller, of Missouri, has made the grand discovery that *Persimmons* serve as a complete substitute for whisky. He says: "Temperance has been my doctrine for many years, yet for a long time I thought a little whisky early in the morning almost indispensable for my stomach's sake; but, like all things else, it sometimes runs out. In its stead *Persimmons* were tried, and found to answer the purpose to a fraction."

It is to be hoped that they may prove an equally effective substitute at other hours of the day.

THE INDUSTRY GOOSEBERRY.

While the improvement in Strawberries has been so decided and rapid as to appear marvellous almost, American Gooseberries have, with the exception of the "Downing," remained so primitive that most persons are not aware of the possibilities of this class of fruits. Those familiar with the excellence of the improved foreign varieties have naturally been desirous to grow these here, and thousands of trials have been made to acclimatize them, but only in very few instances have they proved successful, the bushes being destroyed by mildew after the second or third year. A Gooseberry possessing large size and good quality, combined with freedom from disease, will therefore be hailed with joy by all lovers of good fruits.

The "Industry" Gooseberry now being introduced by Messrs. Ellwanger & Barry, Rochester, N. Y., is now recommended as fully supplying this desideratum. Although of foreign origin it has done admirably upon the grounds of the introducers for three seasons, being a vigorous grower, an immense yielder, and showing no signs of mildew. Its deep red berries are of excellent quality and of the size shown in our illustration.

GROWING PLUMS.

There are many fruits which once abundant in our markets are now met with in limited quantities, and of these the Plum is a notable instance. This is due to two causes, the destruction of the tree by the disease known as the "Black Wart," or "Black Knot," and of the fruit by an insect, the eurenlio.

We have no space to discuss the mooted question of the cause of the former, whether it be of vegetable or insect origin, but two facts seem to be proved, that it is contagious, spreading rapidly over the whole tree, and from one tree to another, and that the only sure remedy is the free use of the knife, cutting away all diseased branches and burning them. We have, however, where the wart attacked a large and important limb, saved amputation by cutting out the diseased portions and binding salt upon the cut, and the limb soon healed.

This disease also attacks the wild Plum, and sometimes the wild Cherry, and where these grow in the vicinity they also should be cut down when diseased, lest the infection spread to the orchard. Too much importance cannot be attached to burning the infected limbs, as if simply thrown on the ground the disease from them spreads to the healthy branches.

We have no hesitation in saying, that by beginning with healthy young trees, and by care, Plums can be grown in spite of the black wart.

The eurenlio is a more serious enemy, but is by no means invincible. He attacks not only the Plum, but the Cherry, Apple, and sometimes the Pear. It is probably owing to the Apple orchards that of late years he has increased so prodigiously, as at one time he was thought only to attack the Plum, when meanwhile he was propagating by millions on the fallen Apples.

Where a Plum is to be had, however, the insect prefers it to any other fruit. The mature eurenlio, which is a small, dull-colored beetle, emerges from the ground when the young Plum is about the size of a small Peach, and continues to hatch for about three weeks. It stings the fruit, making a crescent-shaped mark, and lays its eggs therein. These soon hatch into a white worm, which burrows into the stone, as soon as it reaches which the fruit falls. The worm then goes into the ground, where he completes his transformations. The remedies are many, all in a measure efficacious. They are mostly preventive, for where the fruit is once stung

and the trunk and branches sharply struck with a cloth-covered mallet, so as not to bruise the bark, the beetles will fall upon the sheet and can be destroyed. This should be done morning and night for a period of about three weeks. All fallen Plums, as also fallen Apples and Cherries near by, should be daily gathered and burned.

Following these rules a good crop of Plums may yearly be obtained, and the result is certainly worth the trouble. For family use, it is best to plant dwarf trees, as they are more manageable, and the Plum also always does well, trained espalier, or as a wall fruit.

The choice of varieties must be left to individual taste, but for home use the proportion should be two Greengages to one of every other kind.

In some of the nurseries of Central New-York, Plums are grown in great quantity and perfection, the eurenlio being destroyed as we have directed, and there is no reason why any one who has a small plot of ground should not each summer have a crop of Plums. PRUNUS.

INDUSTRY GOOSEBERRY.

WATERING STRAWBERRIES.

Growing Strawberry plants need a generous supply of water. From the day when the first blossoms appear, until the well-developed fruit is ready to be plucked, the soil where Strawberry vines stand should be kept very moist. The crop of fruit is often damaged seriously by one or two days of hot and dry weather when the plants are in blossom, or soon after the berries begin to grow. If one has an abundance of straw, old hay, or coarse manure, it will pay to spread such material between the rows and close around

the hills, for the purpose of keeping the soil moist. Coarse straw or hay can be spread most advantageously when they are wet.

An ordinary sized Strawberry plot will require only a few minutes' labor with a large watering-pot, to give the plants a generous supply of water every evening. Sawdust, tan-bark, and chip-dirt, when spread over the ground, keep the soil moist and will greatly retard evaporation.

Those who succeed in producing mammoth berries use manure unstintedly and keep the soil well watered. It is a good plan to keep the ground between the rows of Strawberry vines covered with litter, so thickly and evenly that grass and weeds are all smothered. Then to apply water every evening when the weather is not wet and lowery. Where salt hay can be obtained nothing is better for mulching, as it is always clean and free from weed-seeds, is not easily blown off by the wind, and, after the bearing season, can be dried and stored away for another year. S. E. T.

care is usually impossible, although we have saved Plums by carefully cutting out the egg just after the fruit was stung.

If the trees are syringed and dusted with air-slaeked lime the insect will not sting the fruit. But no half-way measures will avail in this; the wash must be begun as soon as the young fruit forms, and continued until the time for the insects to come out of the ground is passed; this time can only be told by observation. If the lime is washed off by rain, it must be immediately renewed, and especial care must be taken to coat the young fruit well.

Paving around the trees prevents the increase of the beetle in the immediate vicinity; salting the ground is also efficacious. Trees grown in a hen-yard often perfect fine crops of fruit, as the hens eat the beetles as they come out of the ground. But the best way is to destroy the beetles by shaking them from the trees; the insects on being disturbed feign death and fall to the ground. If a sheet is spread under the tree,

The Flower Garden.

SPRING FLOWERS.

As breaks the moon-riso o'er the sea,
As steals the morning on the night,
So the slow dawning of the spring
Is flooding all the earth with light.
O'er uplands brown and dusky hills,
Its "cloth of gold" the sunshine flings,
Where fragrant south winds, hurrying by,
Drop blossoms from their balmy wings.

On sunny banks, whose grassy slopes
Are pied with Violets blue and white,
The Primrose, with its golden eyes,
Climbs upward to the mellow light;
And, nodding by the meadow brook,
The knots of yellow Cowslips blow,
And tufts of grass and tender leaves
Sway in the sleepy water's flow.

Beneath the dark and restless Pines,
That whisper through the balmy night,
The Arbutus, mid its shining leaves,
Is trailing blossoms pink and white:
And purple Wood-anemones,
In sheltered nooks and valleys grow,
And Daisies, mid the tawny rocks,
Gleam out like flakes of winter's snow.

But when the false and fickle winds
Shall whisper to the listening trees
Of summer's bright and beauteous things—
Her gorgeous bloom and scented breeze;
When earth beneath the changing skies
Hath blushed in May-bloom, wept in showers,
The spring shall fold her weary wings,
And vanish with the early flowers.

SEASONABLE HINTS.

Hardy plants of all kinds should be transferred to the open ground without delay, but with those liable to be injured by frost it is not safe to risk exposure to the open air before the latter part of this month.

Sowing Seeds.—The proper season for sowing seeds depends considerably on the character of the season. When this is very early, the first sowings may sometimes be made about the middle of April, but north of this latitude it is rarely of any real advantage to commit flower seeds to the open ground before the first of May.

Seeds may be sown in patches among the border plants, in rows or groups where they are to remain, or in seed beds, and afterward transplanted. In either case it is of the greatest importance that the seed is not sown too thickly, and that the soil at the moment of sowing is not too wet, especially early in the season.

The Depth of Covering Seeds varies with their size; large seeds, such as Lupins, Sweet Peas, Marvel of Peru, may be covered an inch or more, medium-sized ones from an eighth to half an inch, while the smallest ones succeed best when sown on the surface only, and slightly pressed down with the hand or a piece of board, which will imbed them sufficiently. There is far less risk in covering seeds too little than too much; if sown too deep they are longer in germinating, and the smaller ones are liable to decay.

Watering.—In dry weather it becomes necessary to water the seeds slightly from a very fine rose watering-pot. In the absence of rain this has to be repeated every day or two. When the seeds have once begun to swell they are peculiarly susceptible to injury from drought, and will speedily perish unless the soil is kept moderately moist.

HARDY PLANTS FOR EDGING FLOWER BEDS.

Many country and suburban folks have no greenhouse, or, beyond their few window plants, greenhouse flowers, but they have pretty and tastefully kept gardens, and blossoms in them from March till November.

As a rule our garden walks, flower-beds, and borders are cut out in the grass-plot, but not infrequently we find little garden patches where there is no grass-plot, but all the ground is used in beds, borders, cultivated plots and the necessary walks. Here we must use some special edging, as brick, tile, or wood, or prettier by far, grass-sod, Periwinkle, Box, or other appropriate plants. But circumstances must govern our selection. The situation may be sheltered or exposed, sunny or shady, the ground moist or dry, sandy or clayey; the beds may be large or small, and the subjects they contain, Roses or shrubs alone, tall or mixed perennials or merely a few annuals.

These things should be taken into consideration in our selection of edging plants. And we should use none other than those that are absolutely hardy in our neighborhood; for instance, *Santolina chamaecyparissas* and *Phubago Larpente* are hardy in New-York, but barely so in Boston. And, in order to have lasting satisfaction, we should use plants of long perennial duration, like Rock Cress and Moss Pinks, and not short-lived ones or those of biennial nature, like Alpine Wall-flower and yellow Alyssum (*A. saxatile*). As verges for walks evergreen plants should be used in preference to deciduous ones; for instance, Periwinkle, Moss Pink, Garden Pink, Thrift, evergreen Candytuft, white-leaved or gentian-leaved Veronica, Thyme, Stone-crop, Houseleeks, Box, Ivy, Statice, Snrose (*Helianthemum*), or creeping Euonymus.

It often happens, when we use grass-sod, Box, or Periwinkle around our beds, we also wish to have an inner border, as a circle of Rock Cress, Prunella, or Spring Orobus; and here we can use either deciduous plants, like the Orobus, or evergreen ones, like the Prunella, only observing that they are neat and compact, and shall continue to last throughout the summer. And they should be of lesser growth than the inner inmates of the bed. In this inner edging we may utilize two or more sorts of plants, especially in the case of deciduous ones. For instance, in a border of dwarf Irises we may plant a row of Crocuses, Snowdrops, Dog's-tooth Violets, Spring Beauty, or Little Squills. In an evergreen border, as of dwarf Veronicas or Stone-crop, these supplementary bulbous plants would be apt to grow so much as to set off patches of the regular border.

Among good edging plants that delight in open, sunny places, are Moss Pink, Rock Cress, Thrift, evergreen Candytuft, dwarf Veronicas, Garden Pink, Santolina, Thyme, *Stachys lanata*, Houseleeks, *Silene maritima*, Tomentose Cerastium, Spring Adonis, the dwarf form (*juvenda*) of *Aquilegia glandulosa*, *Erysimum rupestre*, Stone-crop, Aubrietia, dwarf Bell-flowers as *turbinata*, dwarf Irises, Rock Rose, *Statice incana*, Stellar's Artimesia, Prunella, Siberian Saxifrages, as *cordata* and *ligulata*, and *Geranium sanguineum*.

For shady places Periwinkle is better than grass or any other plant as an edging. Hepaticas, Creeping Alpine and Geneva Bugles (*Ajuga*), Phloxes as *amena* and *reptans*, dwarf Funkias, Sedums, as *ternatum*,

native Violets, especially the variegated flowered *cucullata*, *rostrata* and *striata*, and Epimediums are also suitable for moderately shady places.

Many plants adapt themselves to sunny or shady places; for example, dwarf Irises, Violets, Periwinkle, Houseleeks, Pennsylvania Royal and Virginia Pinks, Epimediums, Bugles, Prunella and Orobus.

Where shrubby beds and clumps are also used as the recipients of a miscellaneous collection of herbaceous plants, the above plants are quite appropriate as edgings; but, where shrubs alone occupy the beds, more characteristic edgings should be used. Say, *Euonymus radicans*, plain or variegated, *Siobolds Euonymus*, *Deutzia gracilis*, dwarf *Retinosporas*, as *plumosa* or *obtusana*, *Daphne Cneorum*, creeping Berberis, hardy Heaths, small-leaved Cotoneaster, *Azalea amena*, and Ivy. Many other dwarf shrubs may be used for the same purpose, and even some, like the Virginia Itca, that grow to considerable dimensions, can be pruned so as to form neat dwarf edgings.

In open, dry, sandy places I find that hoary plants, as *Thymus lanuginosus*, *Veronica pectinata* and Santolinas, thrive well, but better still Stone-crops, Moss Pinks, and Cactuses, as *Opuntia Missouriensis*.

In very moist places we must have recourse to such plants as Gold-thread, Helonias, *Nyrembergia rivularis*, Violets and the like.

Several plants—for instance, Lily-of-the-valley, Moneywort, and *Vinca herbacea*—might reasonably be expected to make excellent edgings, and so they would were it not for their inveterate persistence in spreading beyond their allotted space. Others, as the Mossy Saxrages, Androsaces, and Erinuses, that thrive so well in Europe and make such pretty edgings there, are not worth bothering with here; they refuse to be comforted. Although the above includes a numerous variety of plants, and many of them seldom seen in our gardens, I would say that I have grown them all for years.

WM. FALCONER.

PLANTING LILIES.

Lilies should be planted as early in spring as possible; that is, as soon as the ground has become dry and friable. If the necessary conditions are provided, few plants are easier grown, and yet it seems strange that many fail to meet with success. Lilies must have a deep, mellow, somewhat sandy, moderately rich soil, free from stagnant water. The bulbs should be planted four to six inches deep, according to their size, the largest ones the deepest, except *L. candidum* and its varieties, which should be covered but lightly, and planted in August or September. All Lilies may be planted in autumn as well as in spring, but with fall-planted bulbs, perfect drainage is still more essential.

OOBÆA SCANDENS.

This is one of the most elegant and rapid growing climbers for the garden as well as the conservatory. The seed may be sown out-doors in warm, dry soil, but better success will be insured by starting it in small pots in the house and transplanting at proper time. For window boxes, and vases to drop over the front, it is especially adapted and desirable.

CULTIVATION OF CHRYSANTHEMUMS.

No class of plants thrives so well with as little care as the Chrysanthemum, and as a town-plant it has no equal. It seems to thrive equally well in the smoke and dust of large cities as in the open country, requiring only sun a few hours each day, rich soil, and occasional watering.

Small plants may be planted as early as the first of April,—but any time to the middle of May will be soon enough,—about as far apart as to allow from two and a half to three feet for each plant. This may easily be done where a border can be devoted to them alone; but when grown in a mixed border, where other plants are growing, a space of two feet should be allowed for the Chrysanthemum. The soil must be made rich with manure, and kept clean.

About the first week in June each plant should have the center of the shoot pinched out, which operation is known as stopping. A strong stick should be placed by the side of each plant, to which it should be loosely tied. In a few weeks there will have grown four to six more shoots four or five inches long. These must again be stopped, by continuing the process until the first of August; after which time every shoot should be allowed to grow, and not stopped any more. Keep the plant tied, so as to prevent its being broken by the wind.

By the first week in September many buds will be formed, and, if very large flowers are desired, one-third or more of the buds should be taken off. Some weak liquid manure should be given about the first of October.

If the plants are required for decorations in the house or greenhouse, they may be easily dug up, potted into different sized pots, according to the plants, and set in the shade a few days. They must be well watered, after which they may be placed in the sun until there is danger of frost, when they should be moved into a cool room or greenhouse, but not subjected to fire-heat more than to keep out frost. This is a very simple and satisfactory course of treatment,

and can be carried out successfully by the merest tyro. For very large specimens, and for cultivation in pots, more time and attention are required, costing, of course, more to accomplish.—*John Thorpe, before the N. Y. Horticultural Society.*

SPRING FLOWERING BULBS.

Tulips, Hyacinths, and Crocus bulbs should be taken up during this month, if they are in beds of mixed plants; but do not cut off their leaves, as it is the leaves

their foliage withers completely it can be cut off, and the bulb left to repose. Coleus, or any kind of bedding-out plants, may be put into the same beds without injury to the bulbs. Mignonette and Sweet Alyssum seeds can also be sown around the edges of these beds even as late in the season as June, and the plants will make a fine show and perfume the air by the last of August.

In planting out bedders it is well to bear in mind that, in a couple of months, they will have become six times as large as when planted, and will, therefore, crowd each other sadly unless plenty of room is given to them. It is the fashion now to peg down the shoots of variegated plants, and hair-pins are excellent for this purpose. Plants that break off easily are better protected from wind and thunder-storms if they are thus arranged, and, when the first frost comes, they are also more easily covered.

DAISY EYEBRIGHT.

SWEET PEAS FOR CUTTING.

Select a good deep soil in the kitchen garden, and take out a trench as if for Celery; dig in a quantity of rotten manure at the bottom, and then fill in the soil nearly level with the surface; scatter the seeds thinly, and cover them with about one inch of soil. The young plants will soon appear, when some coal ashes should be scattered over them. Put stout branched sticks on each side of the row, and if cold winds prevail, a few evergreen branches will prove a great protection, but they must be removed before the vines grow.

The plants grow rapidly, and will soon come into flower; then is the time to apply a good coating of rotten manure at least two feet wide on each side of the row, and if dry weather prevails give copious supplies of water, and liquid manure at intervals of a fortnight.

Gather the fully expanded blooms before they fade, as if allowed to seed they soon check the successive formation of flowers. For cutting, a good mixed packet of seed will produce nearly all colors, but they may all be obtained separately.—*London Garden.*

TYPES OF CHRYSANTHEMUMS.

which assist the maturing of the bulb, and the stalk must wither in order to ripen the bulb thoroughly. Let them lie in the sun a day to dry, and pack away in paper bags until September, when they should be replanted. If they have to be taken up before the leaves are entirely dry, place them close together in a dry spot, and cover with an inch or two of soil. In two or three weeks they will have ripened completely, and may be stowed away.

But, if they have not been planted three years, they need not be disturbed, and as

The Window Garden AND GREENHOUSE.

THE CLIMBING SOLANUM. (*Solanum Jasminoides.*)

Last spring I procured a plant of the climbing Solanum and I am so well pleased with it that I want to tell the readers of THE AMERICAN GARDEN about it. It is a slender growing vine having pretty foliage. It supports itself by curling the stems, to which its leaves are attached, about whatever it comes in contact with. During summer my plant made a growth of over six feet. It did not bloom until fall, but since then it has had flowers nearly all the time. These flowers are about as large as those of the Catalonian Jasmine, star-shaped, and of a pearly white. Sometimes they have a slight lavender tinge, and in a few I have seen a faint rosy tint. These flowers, which are borne in clusters of about half a dozen each, have a delicate grace that I have never seen in any other climbing flower. The petals have a look like that of the finest crape, being creased or wrinkled like erapo along the center. I find that by cutting it back often a great many branches can be made to grow, and all of these produce flowers.

It has been one of my most satisfactory plants during the winter. I have it trained up a large Oleander, and it has wound itself all through the top, and as both plants are in bloom at present, the effect is charming, as the contrast between the rosy flowers of the Oleander and the white ones of the Solanum is so decided. A good many of the new branches hang from the branches of the Oleander in festoons of graceful foliage. The buds are charming before they open, being pearly white, and having so close a resemblance to berries that they are often mistaken for them. The plant is a most satisfactory one at all stages and seasons. It would be very effective when trained along conservatory rafters, or about a window, I think. Mine is potted in ordinary garden soil made light with sand. It requires considerable water. The red spider would trouble it somewhat if I did not make it too wet for him.

E. E. REXFORD.

THE AMAZON LILY. (*Eucharis Amazonica.*)

Of all the white flowers exhibited at our flower shows, none attract more general and deserved attention than this comparatively new plant. It is a native of Granada, belongs to the Amaryllis family, and requires, for winter forcing at least, hot-house treatment. The flowers, which are produced in trusses of from four to eight, are of rare beauty, chaste in form, pure white and deliciously fragrant, and—what gives additional value to the plant—may be produced at any season of the year. In fact, a dozen of plants properly managed will furnish flowers all the year round.

There are two ways of growing this plant. One, says a writer in *Gardening Illustrated*, is to pot them without division, the way in which large specimens are obtained; and the other is to divide frequently, growing the large bulbs in single pots. The latter plan

answers best for room decoration. They may be grown well either in loam and peat, in loam and leaf-mold, or in pure turfy peat. To bloom them freely they require a period of rest after a season of growth. This rest is obtained by moving the plants to a lower temperature, and, as they are evergreen, water must never be withheld so far as to cause the leaves to suffer. In summer the plants may stand a time in the open air, and such plants throw up strong spikes after being placed in gentle heat again.

By following a system of alternate growing and resting periods, several crops of flowers may be obtained in one season; and by growing a sufficient number of plants to have relays always coming on in succession, plants in bloom may always be had. Bottom-heat, where available, is useful for pushing forward sluggish bloomers. They are very accommodating as to temperature, but during the time of growth they should have a night temperature of at least 60°. As they delight in moisture, the pots must be well drained, and if a little crushed charcoal and sand be

THE AMAZON LILY.

mixed with the soil, to increase its porosity, it will be an advantage. Clear seot water should be given occasionally when growing freely or blooming.

HOME-MADE FLOWER POTS.

A correspondent of the *London Garden*, having observed that a mixture of clay and cow manure with a little sand becomes very hard when dried, conceived the idea to mold flower pots out of this material. He first molded them in ordinary flower pots, but, on account of their breaking so easily, substituted an iron mold. These pots, after being thoroughly dried, were employed for potting Geraniums, Verbenus, Lobelias and other bedding plants.

I had the satisfaction, says the writer, of seeing the plants do well in their clay covering, and the pots bore the watering well. In May they were plunged into the summer beds with the plants, and I calculated that the clay and cow manure, gradually falling to pieces, would help to support the plants and would first induce it to form a ball of

roots, so that in autumn its removal would be attended with little loss.

The result has been more satisfactory than I anticipated; the clay pots, in most instances, have remained entire, but the roots have pushed through the bottom, and above the rims, and the plants came up with a compact ball, very different from others turned completely out of the pots, which have sent down long roots, half of which they had to lose on removal. I have had some of these pots preserved with the plants in them as they were taken up, and I am persuaded the contrivance will be of considerable value to amateur horticulturists.

EMBELLISHING A WINDOW.

The following excellent plan for decorating a window is given by Mr. John G. Barker:

"Procure a pan twelve or more inches in diameter and six inches deep; place in the center a seven or eight inch pot, then place proper drainage and soil in the pan, and plant *Lycopodium denticulatum*, or any of the varieties of *Tradescantia*, which will cover the surface and hang over the sides. In the pot in the center put a *Dracæna*, Palm, or any plant which suits your fancy, and place the whole in a stand just largo enough to hold it and set opposito the window, and with one or two brackets on each side of the window for such plants as you may choose, you have a decorated window with very little trouble. A few cut flowers may be placed in the pan, and will last a long time. The vines will completely hido both pot and pan, and the center plant can be changed whenever desired without breaking up the arrangement. If more than one is used in a room they should not be alike."

Such an arrangement requires but little care, yet, as in the cultivation of all house plants, the great aid to success is enthusiasm in the work.

COMPARATIVE HARDINESS OF PLANTS.

On the morning of the great freeze, last winter, writes a correspondent from Tennessee, the thermometer stood 8° below zero outdoors, and 34° above in the warmest part of the greenhouse. But further from the tank no thermometer was necessary to indicate the frost; all the Colours were killed, all the Begonias, my *Hoya carnosa*, together with my other tender plants, while *Peperomias*, *Maranta zobrina*, *Primula Sinensis*; *Geraniums*, *Bowardias*, *Azaleas*, *Camellias*, etc., were all right.

Tradescantia discolor was killed, while *T. zebrina*, in the same basket, remained uninjured.

IMPORTANCE OF DRAINAGE.

The Hon. Marshall P. Wilder, who has cultivated house plants for the past fifty years, considers perfect drainage, whether in pots or the open fields, the basis of all successful cultivation. He places moss over the crocks used for drainage in pots, and the roots piore into it. If the surplus water does not pass off, the soil will become sour, the roots rot, and the plants die. In mild weather house plants should be taken out on the piazza in shade, to have a little fresh air, which will revive them wonderfully.

ABUTILON.

The different species and varieties of Abutilons form a most beautiful and useful class of plants belonging to the natural order Malvaceæ. They are commonly known under the name of Flowering Maple, from the resemblance their leaves bear to those of the Sugar Maple. Indeed, the whole plant strikingly resembles a dwarf Maple tree. They are a class of hard-wooded greenhouse shrubs, most of them attaining a height of from two to six feet, blooming abundantly at all seasons of the year; and, in addition to this, several of the varieties have beautiful mottled or blotched leaves, usually of a bright yellow color on dark-green ground, giving them more the appearance of a piece of Mosaic work than the foliage of a plant.

When grown in pots, during the winter season, they furnish a quantity of beautiful, pendulous bell-shaped flowers, that vary in color from pure white to orange scarlet, with all varying and intermediate shades, some of them being beautifully veined and striped. All of them do well, and flower finely when bedded out during the summer season. They are also very popular plants for the window-garden on account of their healthfulness, their cleanly habit, freedom from insect pests, and their constant flowering.

The Abutilons are easily cultivated, doing well in a compost of two-thirds well-rotted sods, and one-third well-decayed manure. They require a temperature of 48° to 56°, a light, sunny situation, and a liberal supply of water.

When grown for the window-garden, young plants should be obtained early in May, placed in four-inch pots, and then plunged in a sunny situation; turning the pots occasionally during the summer, and watering if necessary. About the first of September take them up and repot into eight or nine inch pots, according to the size of the plants, taking care to drain them well. When potted, water freely, and place in a shaded situation until cool weather sets in, when they should be brought inside.

When grown for the greenhouse a more liberal treatment should be given; they should be potted as well as shifted into larger-sized pots. And while for the window-garden young plants should be procured every season, for the greenhouse old plants will do as well, if they are well cut back early in May, and treated as advised for young plants.

Of the many beautiful varieties the following are the most desirable: *Duc de Malakoff*, especially the variegated form, with leaves blotched and mottled with white and golden yellow. *August Rossold*, large foliage, beautifully blotched with green, yellow, and creamy white. *Darwini tessellatum*, a very beautiful variegated variety, and moreover very free flowering. *Boule de neige*, pure white flowers. *Darwini*, orange scarlet-veined pink. *John Thorpe*, bright yellow. *Santana*, brownish crimson. *Rosaflorem*, beautiful rose-colored flowers. *Blood Red*, blood red with dark veins; and *Joseph Hill*, with large, orange-crimson flowers.

A. Mesopotamicum and *A. M. variegatum* are very distinct varieties of drooping or trailing growth, the flowers of both being yellow and scarlet. They require a more

liberal treatment, and should be planted out in a rich, deep border during the summer season. When taken up, they may be trained to the sides of the window-garden, or on a low, circular trellis. They may also be placed in rustic baskets and suspended from the rafters of the greenhouse. Grafted or inarched on strong, erect growing varieties, they will, with a little care and attention, form excellent decorative plants for the greenhouse or conservatory.

CHAS. E. PARNELL.

WINDOW BOXES OF FLOWERS.

Of home decorations nothing is so pleasing to the eye, and gives so refined and home-like an appearance to a house, as well arranged outside window boxes; and country residents who imagine them adapted to city houses only deprive themselves of a great means of enjoyment. The season for preparing and planting window boxes is near at

ABUTILONS.

hand, and how easily they may be managed is pointedly and instructively shown by a correspondent of the *New-York Tribune*, who relates his experience as follows:

The boxes were made of pine, three feet in length, one foot in width and nine inches deep. To simulate panels a piece of molding was put around the edges of the sides and the ends. The supports were iron brackets screwed to the house, the horizontal part just long enough to hold the boxes, which were closely fitted under the window sills. Both boxes and brackets were painted like the body of the house—an olive drab—so that the latter were inconspicuous when not occupied.

The boxes were filled with well-enriched sandy loam, with a sprinkling of charcoal and guano, and planted with strong, healthy plants the latter part of May. For bloom I depended mostly upon Geraniums, having some of the best varieties known to florists,

and I placed lengthwise of each box three or four large plants, filling in smaller ones in front and in the rear, together with the finest varieties of Coleus and Achyranthus, and plants also with small delicate foliage. In front a large silver-leaved Geranium occupied the center of one box, a white *Centaurea* the other. Shades of rose color and lake predominated in one, mixed with blue *Lobelia* and blue *Ipomœa*.

For trailers, masses of *Othonna crassifolia* served me, with many seedlings of *Thunbergia* raised in a hotbed. The latter gave an abundance of pure white flowers, and of deep orange and buff. *Polygonum suavis* was also utilized, and it had a wonderful growth, often sweeping the ground or running from box to box. The Geraniums outdid themselves. They were young, stocky and eager to display their beauty—great rosy clusters appeared here and there, vying with the scarlet or crimson sorts, which were very handsome in their emerald setting.

Not only were the plants disposed to advantage in front, but I was still more anxious to make the back side such as to gratify the eye within the room, for at these windows we had our easy chairs, and did our sewing and reading, and the close proximity of the plants gave us much satisfaction. It is always pleasant to look up from your book or your work to rest the eye on something agreeable—a picture, a row of flowers, or a corner of the room with artistic arrangements, so this bit of gardening with its gorgeous coloring so near was truly charming.

The abounding vitality, the tender shading of color and highly decorative effect are not easily forgotten, and compelled admiration from those who were determined not to be satisfied.

It was said:

“You won't like the boxes.” “They will be a failure.” “The plants will burn up with glass for a background.” “You can't use your blinds to darken the room, and when the hot weather and the flies come you will wish your boxes elsewhere.” Finally, “You had better leave window boxes for city people.”

It was ungracious in me not to heed these criticisms, but as I did not I can now confidently commend the plan to all who desire to make their surroundings attractive. It is a great saving of labor, as the boxes can be watered from within, and with thick shades and wire screens we scarcely missed the use of window blinds.

Doubtless the idea originated in the city where there was not ground for flower beds, but there is no reason why it should be confined there, for it furnishes a rare opportunity to embellish the country home.

REVIVING CUT FLOWERS.

Hot water will generally revive flowers that have wilted from having been cut for some time. Place the lower part of the stems in nearly boiling hot water until the petals become smoothed out, then cut off the part that has been in the hot water, and put the flowers in luke warm water and keep in a cool room. White flowers are apt to turn yellowish and do not respond to this treatment as readily as colored ones.

Lawn and Landscape.

EVERGREENS.

A lawn or yard does not seem complete without a few Evergreens. They are a constant source of satisfaction. In summer they blend harmoniously with the season's favorites, and in autumn they form a beautiful background, setting out to advantage the frost-tinted leaves. In winter they wonderfully relieve the eye from the dreary monotony which reigns about. From under their protecting boughs peep the first green tints of spring, and they freight the air with their healthful odorousness.

Just at present I am not speaking of those little dwarfed and stunted specimens, so very fashionable at present. I have in my mind new those generous Pines, Balsams, and Firs that used to form a snug little grove along the north side of our yard, from the roadway back beyond the buildings. They had been set many years before, with some regard to regularity; but afterward they were allowed to grow in their own gorgeous way, and they were the pride of our old homestead. My fondness for Nature's own handiwork in the shaping of Evergreens was, no doubt, indeed and strengthened by this early association.

During the last few years I have had occasion to handle many young Evergreens, transplanting and shipping away. I do not now recollect of ever losing one in transplanting at home. This is partly owing, no doubt, to congenial soil and short distance of removal. Yet, if I could have the handling of them from the time they were taken from their wild haunts until they were placed where they were to stay, I would not be afraid to guarantee their success in less favorable localities. Others may have just as good methods, but they can have no better success.

As to the season for transplanting, either fall or spring is good. The *when* is not so important as the *how*. I lean a little toward the spring planting, however, as the ground is then more moist, and no other vegetation in the way about the roots and stems to obstruct the work of taking up the young trees.

My first and main precaution is to secure the body of mold immediately around the tree that contains most of the feeding roots in a tree of small growth. I have this lifted out carefully with the tree in the center, as little disturbed as possible, and then wrap coarse sacking about the whole, drawing it up around the trunk and tying firmly. In this shape they can be loaded into a wagon-box that has a thick layer of straw in the bottom, and taken home. They should be set out at once, watered and staked. The reader will understand that this way of taking up can only be practiced on short distances, where the trees can be taken home and set out in a few hours at the most. If they are to be shipped, the mold must be detached, and moss worked in among the roots and bound around them. Even here I hold to the idea of wrapping coarse sacking around the whole, and fastening around the stem. The whole mass is then moistened, after which treatment they will stand quite a journey and come out in good condition.

If the planter finds that the roots are at all

dried up when he comes to set them out, the tree may as well be pitched into the brush-heap at once, for it will sooner or later find its way there. Never use manure of any kind around the roots of a young evergreen tree. Vegetable mold is good, but they do not need a rich soil. They should always be staked firmly, for they offer a thick top to the wind, and if twisted about, the roots cannot get a hold.

W. D. BOYNTON.

TENNIS LAWNS.

The first thing in the making of fresh lawns is to fix on a suitable site, which, if possible, should be so chosen as not to be shut in too much with shrubs and trees, although shrubs are desirable to a certain extent to secure privacy, and trees for partial shade—a great boon on bright days. The trees should therefore be on the south side, and the shrubs where they will shut in the ground from public view; but it is very important that they be not sufficiently near for the balls to be driven among them, as then they have to be continually hunted up. This labor may, to some extent, be obviated by the use of nets; but the better way by far is either to have a sunken court or raised banks, the latter being preferable, especially if the position happens to be at all wet and low. In this case the ground should be drained by running a row or two of tiles through it.

The draining done, the next thing is to level, making the ground uniformly firm and solid. If the soil is found at all to be stiff and close, it is a good plan to use plenty of sand or road scrapings at top, or in lieu of these fine cinder ashes, either of which will prevent the surface from becoming very hard and cracking in dry weather, or sleppy and muddy in wet. As soon as it is leveled and dressed as described, it will be ready for turfing or sowing; if turfs can be had, they are best, as there is then a good bottom at once.

To have fine herbage on the sods they must be obtained from a meadow or pasture that has been closely grazed; they should be cut about nine inches or one foot wide, three feet long, and three inches thick, sizes handy for laying down. When this is done, it will be necessary to ram any projecting or high parts down, and then make all smooth by aid of a heavy roller. This should be plied from time to time during the spring, always taking advantage of any rain or thaw after a frost, as soon as the surface is soft and in a condition to be affected by pressure.

In the event of turf being difficult to procure, a good lawn may be soon had by sowing seed. The preparation requisite for this is just the same as that for turf. The best kind of seed for sowing to form fine courts or lawns is that which consists of a mixture of lawn grasses and small clover. The seed may be sown as soon as the ground can be brought into proper condition; it then germinates quickly, and is soon out of the way of birds. When up, gentle rolling is all that is necessary till the grass gets along. Then the mowing machine must be put to work, but the grass should not be cut close till it becomes well established, when the machine ought to pass over it regularly once every week all through the summer and autumn. This will cause it to spread and thicken from the roots like a carpet, elastic and pleasant to tread on.—S. D., in *London Garden*.

THE LAWN BORDER.

By the term *border*, says Mr. Geo. Ellwanger, are meant the outlines of the lawn proper, or such margin as may be devoted to trees and shrubs of the ornamental type. This may be of greater or less dimensions, according to the size of the place. In an average-sized ground a good width would be about twelve to fourteen feet. The lawn, of course, requires its trees; here one for shade, there one for protection, and there still another to produce a desired effect in landscape expression. But trees and shrubs on the lawn should be dealt out with a sparing hand, especially when the space accorded to the turf is limited.

A lawn can never present a complete and finished appearance without its border of trees and shrubs. Indeed, the lawn border is as important a factor in the artistic treatment of one's home surroundings as the lawn itself.

The border will naturally be laid out with sufficient variety in its curves and outlines, and will inclose the lawn entirely or in part, as may be considered most desirable. In planting, the larger trees will be placed in the back-ground, followed with the smaller trees and shrubs in proper gradation. A few groups of deciduous shrubs well arranged, where the space is ample, produce a fine effect, the more so when set off by a back-ground of evergreens. If the approach to the house will admit, a few of the larger trees should be planted on the south side of the entrance and house, for the benefit of their shade, such as Scarlet and Double Horse Chestnut, Linden, Birch, Elm, Norway and Cut-leaved Maple.

Judicious planting after the ground has been well prepared by sub-soil plowing, enriching, grading and draining if necessary, will greatly enhance the value of a place, to say nothing of the enjoyment that would recur to the owner, and be shared by his family and friends.

To trees we are not only indebted for grateful shade in summer, but especially for protection from cold in winter. Protection by evergreen screens in exposed situations would add much to the comfort of man and beast.

HARDINESS OF RETINOSPORAS.

Referring to some remarks by Mr. W. Barry in a former number of THE AMERICAN GARDEN, our correspondent P. J. writes us from Halifax, Nova Scotia: "*Retinospora plumosa-aurca* may not be hardy at Rochester, but it is quite hardy here and stands 20° below zero; so does *R. plumosa*, of which I have one about seven feet high. *R. pistifera* is also hardy here; I have one about eight feet in height. Strange to say, another about ten feet from this one was cut down to about a foot from the ground the winter before last, whereas the other was not in the least touched. I do not quite understand the cause." [Survival of the fittest.—Ed.]

"Some years ago, when in Boston, I visited the establishment of Mr. Hovey, and when talking with him about various Conifers he said many people injure their trees by taking too much care and protecting them with Spruce boughs. I had been in the habit of doing so, and found every spring the trees cut back. Since then I have not covered at all and find they do much better."

Foreign Gardening.

GINSENG CULTURE IN JAPAN.

Ginseng (*Panax quinquefolium*) is a herbaceous plant growing wild in rocky or mountainous woods, especially in the Alleghanias and in the Upper Lake regions. The stem is round, smooth, a foot high, bearing at its summit a whorl of three compound leaves and a single umbel on a central peduncle. The flowers are small, yellowish, the berries bright red. The root is large, four to nine inches long, spindle-shaped, often forked, whitish, thick and fleshy; and this is the valuable part of the plant.

In China and Japan it is highly prized as a medicine, being the most expensive as well as most relied upon remedy for almost every ill human flesh is heir to, although with its remedial virtues are not recognized. The exports from this country amount to about half a million pounds annually at a value of nearly a million dollars.

We have received several inquiries as to the practicability of its successful and profitable culture here, but cannot learn that it is cultivated anywhere in this country, and should be much pleased to receive any information from those of our readers who may have some knowledge about this subject. The spontaneous growth of Ginseng is getting scarcer with every year, so that it may be well to attempt its cultivation, which, if it prove successful, will no doubt yield a good profit.

A correspondent of the Agricultural Department who has recently traveled in Japan states that the plant is largely cultivated there, and the following description given by him may be of interest to those who may attempt its culture here.

The Japanese select for the culture of the Ginseng, black, mucky, and low, wet soil as the only kind in which it will attain perfection and become white; if grown in ferruginous soil it becomes reddish, and is less valuable. The ground after being well prepared and manured is laid out in beds, always running east and west. To shelter the plants from the direct rays of the sun and from heavy rain storms each bed is protected by a roof made of straw and laid upon poles supported by posts. In Southern Japan, in the provinces of Idzumo and Hoki, the planting takes place in November, and farther north in April.

The seed is deposited two to three inches apart each way. The plant is of very slow growth, and takes three to four years to attain its maturity. The flower buds start from the base of the leaves, but unless seeds are desired these are pinched off. The seeds, after being gathered, are buried in the ground, one to two feet deep, to preserve their germinating powers.

The harvest takes place in July and August of the fourth year. The roots are cylindrical in shape, about as thick as a finger, white and often prong-shaped toward the lower end. In the fresh state they weigh about twenty to twenty-five grains, but occasionally double that amount. After digging out the roots they are freed from all dirt adhering to them and then carefully washed, after which they are scalded in boiling water or steam, so as to make them appear

yellowish brown, when the cross-insertion is made. They are then laid on shelves, and, according to size, exposed for from two to eight days to a heat averaging 100° to 120° C, after which they are perfectly dry and fit for market. They may also be successfully dried in the sun.

When ready for market the root is yellow or brown, semi-transparent, brittle, and of bitter-sweet taste, and must be guarded against dampness. Of the stem and leaves is prepared a jelly, which in taste reminds one somewhat of licorice, with the addition of some bitterness. This is never exported.

GRAPE-GROWING IN SICILY.

The Grape is rapidly taking the place of the Olive and Sumac on the Island of Sicily. According to the report of the French Consul at Palermo, the annual production of wine amounts already to from one hundred and ten to one hundred and thirty millions of gallons, with every prospect of considerable increase in the future. The brand best known here is *Marsala*, but many others of reputed quality are produced there, and known as *Zucco*, *Corvo*, *Moscato*, *Albaneto*, *Marcarello*, *Aromena*, etc.

Horticultural Societies.

NEW-YORK HORTICULTURAL SOCIETY.

Roses and Orchids formed the leading and most attractive feature of the April exhibition, and it would be superfluous to state that their beauty and excellence were highly commended upon. All the leading varieties of the Roses of the season were represented: *Niphetos*, *Maréchal Robert*, *Perle des Jardins*, *Souvenir de Wm. Wood*, *La Frauce*, *Bon Silene*, *Souvenir d'un Ami*, *Douglass*, *Chas. Rovoli*, *Cornelia Cook*, *Catharine Mernuet*, *Gloire de Dijon*, etc. A huge bunch of *Mabel Morrison* attracted considerable attention; this is a sport of *Barouess Rothschild*, equal in all its merits, but is pure white, slightly tinged with pink. *Mad. Cusin*, of a very peculiar violet-rose, tinged with yellow, is improving with each exhibition. Mr. Otto Andrea showed a very fine hybrid-perpetual seedling, raised by him and named *Queen of Queens*.

A collection of cut flowers from Mr. Geo. Such was of unusual merit, and contained more choice species and varieties than we have ever seen in similar exhibits. Among them were: *Anthurium Schertzerianum*, several species of *Amaryllis*, *Ixoras*, *Statice Halfordi*, *Passifloras*, *Azaleas*, several rare Orchids, etc.

Hallock & Thorpe exhibited a fine specimen of *Streptosolen Jamesoni*, a description of which was given in our January number.

Another interesting and attractive exhibit was a collection of a dozen or more named varieties of Persian Lilacs from John Henderson.

Tulips, Hyacinths, Lilies of the Valley, Pansies, Carnations, Geraniums, Cinerarias, Primroses, Violets, Calceolarias, and many other plants and flowers were shown by various exhibitors, both amateur and professional.

PRIVATE FLOWER EXHIBITIONS.

The great competition in the flower trade during the past winter has stimulated the New York florists to unusual exertions, resulting in a series of special flower shows. In fact, the windows and stores of our leading florists present continuous flower shows during the spring months.

The largest and best of these was that of Mr. C. F. Klunder, 907 Broadway. All the plants and flowers were of remarkable excellence, and the arrangement was highly artistic and tasteful. A large circular group of Standard Roses was a magnificent sight, but it would be difficult to single out the best where all are of superior merit. There were groups of Lilies, Hyacinths, Cyclamens, Cinerarias, Persian Lilacs, and of scores of other plants, a remarkably fine specimen of *Gardenia florida*, two large well-shaped *Laurus nobilis*. Of Orchids, although in not very large numbers, there were some superb specimens of *Dendrobium nobile*, *fimbriatum oculatum*, *Thyrsiflorum*, *odontoglossum grande*, and *macrophyllum*.

As most of our fashionable florists have their specialties in certain flowers and styles of arranging bouquets and designs, special and private flower exhibitions will, no doubt, be among the permanent features of this city.

MASSACHUSETTS HORTICULTURAL SOCIETY.

Capt. John B. Moore, chairman of the committee appointed by the society, recommends the following as the best Hardy Roses for outdoor culture:

CONTINUOUS BLOOMING ROSES.

Alfred Colomb, Annie Wood, Boieldieu, Caroline de Sansal, Fisher Holmes, François Michelin, Gen. Jacqueminot, Marie Baumann, Mme. Victor Verdier, Mons. E. Y. Teas, Pierre Notting, Rev. J. B. M. Camm, Xavier Olibo, *Charles Darwin, *Countess of Oxford, *Dr. Sewell, *Marguerite de St. Amande, *President Thiers. The last five (marked with stars) are fine, constant bloomers, but liable to mildew.

HARDY ROSES FOR GENERAL CULTIVATION.

Alfred Colomb, Anna de Diesbach, Annie Wood, Baron de Bonstetten, Baroness Rothschild, Charles Lefebvre, Duke of Edinburgh, Étienne Levat, Fisher Holmes, François Michelin, Gen. Jacqueminot, John Hopper, Jules Margottiu, La Rosière, Marie Baumann, Marquise de Castellane, Maurice Bernardin, Mme. Gabriel Luizet, Mme. Hippolyte Jamain, Mme. Victor Verdier, Mons. Boncenne, Mons. E. Y. Teas, Paul Neyron, Rev. J. B. M. Camm, Thomas Mills, *Louis Van Houtte, *Mlle. Marie Rady, *Pierre Notting. The last three (marked with stars) are difficult and uncertain, but so remarkably fine that the committee could not refrain from mentioning them.

COTTON CENTENNIAL EXPOSITION.

The special Premium List of the Horticultural Department of the World's Exposition has just been issued. It is certainly the most complete and extensive schedule of the kind we have ever seen, comprising every branch of Pomology, Arboriculture, Floriculture, etc.; and the premiums to be awarded are most liberal. The pamphlets may be obtained from the superintendent, Mr. Parker Earl, Cobden, Ills.

OUR BOOK TABLE.

New Jersey State Horticultural Society.—Proceedings of its ninth annual meeting which, as usual, are full of interesting information. The pamphlet contains, in addition to the papers mentioned below, President Ward's address, and many other highly valuable papers and essays.

E. Williams, Hybridizing and Cross-breeding.—A Paper, read before the New Jersey State Horticultural Society. The author gives here plain, common-sense explanations of the meaning of and difference between hybrids and crosses, practical instructions for their production, and valuable suggestions of how to improve our Grapes and other fruits.

J. T. Lovett, Fruit List of the State of New Jersey, reprinted in pamphlet form, from the author's report of the State Horticultural Society. A carefully prepared list of all the principal varieties of fruits cultivated in the State, grouped according to seasons and arranged by geographical sections, so that any one can see at a glance which varieties, for market or home use, succeed best in his county. This is a most valuable contribution to the pomological literature of the State, the imitation of which by every State Horticultural Society in the Union is highly to be recommended.

Western New-York Horticultural Society.—Proceedings of its twenty-ninth annual meeting, held at Rochester. The Reports of this Society, which numbers among its members many of the most experienced and distinguished pomologists and horticulturists of the country, are always looked forward to with interest, as we are always sure to find in them a rich store of valuable matter. Among the many good papers contained in the present volume are President Barry's address, the reports of the committees of the different sections, county committees, and essays by Dr. Sturtevant, Professor Caldwell, John J. Thomas, P. Reynolds, Joseph Harris and others.

The Scientific American.—This excellent weekly journal is not, as might be supposed from its name, devoted to strictly scientific matters only, but presents in a clear, practical manner, the entire progress and development of our age. Science, art, literature, mechanics, industrial interests, inventions and discoveries of every kind, natural history, agriculture, horticulture, and many other topics of interest to every intelligent person, receive proper attention. As an exponent of American Progress it stands unrivaled; and, combined with a high moral tone throughout, its educational value as a family paper cannot well be overestimated. We are glad to perceive its marked popularity and success, which have compelled the publishers to remove to more spacious quarters. The new offices are at No. 361 Broadway, corner Franklin street; they are beautifully lighted, airy apartments, more than fifty feet wide and one hundred and sixty feet long, and furnished with everything needful for the prompt and efficient execution of business.

CATALOGUES RECEIVED.

Ellwanger & Barry, Rochester, N. Y.—Supplementary List of Novelties and Specialties. Also Descriptive Catalogue of Select Roses, with brief practical directions for planting, etc.

Matthew Crawford, Cuyahoga Falls, O.—Catalogue of Strawberries and other small fruits. A very neat and tasteful little pamphlet, giving cultural directions, and concise and truthful descriptions of all the best new and old varieties.

Parson & Sons Company, Flushing, N. Y.—Descriptive Catalogue of Hardy Ornamental Trees, Flowering Shrubs and Vines. Special attention is directed to their magnificent collections of Rhododendrons, Roses, Magnolias, Chinese and Ghent Azaleas, Camellias, Japanese Maples, and other rare and choice plants.

Gardener B. Weeks, Syracuse, N. Y.—Illustrated and Descriptive Price List of Grappling Hay Forks and Railway Hay Conveyors. This apparatus took the highest award at the trial of N. Y. State Agricultural Society, and for excellence of workmanship and construction, as well as for ease and efficiency of work, is not excelled by any other.

E. D. Sturtevant, Bordenloven, N. J.—Catalogue of Water Lilies, Greenhouse and Bedding Plants. This is a most interesting pamphlet, giving descriptive and cultural directions of all the choicest and rarest aquatic plants in cultivation, together with several illustrations. This is the only establishment in the country which makes a specialty of these plants.

Zimmerman Fruit Dryer or Evaporator.—Zimmerman Mfg. Co., Cincinnati, O., and Burlington, Iowa.—Catalogue of their various drying apparatuses, with many valuable instructions and directions for evaporating, bleaching, con-serv-ing, crystallizing and marketing of fruits. The Zimmerman Evaporator is made of galvanized iron, is portable, fire-proof, and covered by nine patents.

Boomer & Boschert, Syracuse, N. Y.—Illustrated Catalogue and Price List of the Cider and Wine Presses, and other Machinery manufactured by the Company. With one of these presses, it will be recollected, one hundred barrels of cider were made in ten hours, at the Centennial Exhibition at Philadelphia. We have frequently seen these presses in use, and cannot conceive of anything more complete and better adapted for the purpose.

ANSWERS TO CORRESPONDENTS.

Late Strawberries.—G. B. W., New Bedford, Mass.—James Vick, Kentucky, Mount Vernon are among the best late varieties. "On moist, rich ground" we should try Golden Defiance, and if good care can be given, Jersey Queen.

Stephanotis and Anthurium.—H. C. W., Sutton's River, Vt.—Unless wanted for forcing, Stephanotis can be wintered in a temperature of from 45° to 50°, and will bloom only the better for it. Of course, when kept in so low a temperature, but little water should be given. For fuller directions see March number.

Anthurium Scherzerianum requires strong heat and a treatment similar to that given to tropical Orchids.

Lilium Harrisii in the House.—M. W., Quaker Hill, N. Y.—This as well as all other Lilies that have been forced during winter should, after blooming, be transferred to the open ground. The place in which they are planted must be well drained, naturally or artificially, else the bulbs are very apt to rot. They will not bloom again before another year.

Lilies from Seed.—G. F. S., Hennepin, Ill.—The easiest and usual way of propagating Lilies is by offsets, or seeds, but they can also be grown from seed. This should be sown as soon as ripe, in frames or boxes where it can be protected from severe frost. Most of the seeds will not come up until the second season. When the bulblets have attained sufficient size—after about two years—they have to be transplanted singly, and treated the same as small offsets.

Grape Cuttings have to be planted as early in spring as possible, before the buds commence to start.

White Climbing Roses.—S. D. P., Walnut Hill, Mass.—There are several varieties of white climbing Roses, *Benett's Seedling*, one of the Ayrshire class, is one of the best; it has medium-sized, very double, pure white flowers. They are not quite as hardy as the Prairie Roses, but with light protection stand our severest winters very well. There are also white *banksia* Roses. The flowers are small, but of a delicious fragrance resembling that of the Violet more than the Rose. This class is not hardy at the North.

Bulbs Not Blooming.—Several Inquirers.—Without a knowledge of all the attending circumstances it is impossible to tell why bulbs refuse to bloom. The most frequent cause of failure is that they are kept too wet and too warm from the start. All plants, when not in vigorous growth, should be watered only sparingly. Then, bulbs need an annual rest after flowering, or after the completion of their growth; unless this is given by drying them off, partially at least, they cannot recuperate sufficiently to produce flowers. The culture of Annyrills, Gloxinias, and Achimenes was described in previous numbers, and will be treated of again as soon as feasible.

Pruning Melons and Tomatoes.—D. C. A., Monroe, N. C.—All the good that pruning of Musk and Water-melons does is that they bear a little earlier. The process consists in pinching off the vines at the third joint from the root as soon as they have made sufficient growth. They will then form side shoots, which may be pinched in again. The pruning of Tomatoes consists in topping the leading shoot. This is said to promote earliness, but we have never seen much benefit result from the operation, and consider it hardly worth the trouble.

Teasel.—A. R., Vineland, N. J.—Teasel, *Dipsacus fullonum*, is a hardy biennial plant, the dried flower-heads of which are used in the manufacture of cloth. As far as we are aware it is only cultivated in a few towns in western New-York. It requires good, well-drained ground. The seed is sown in the latter part of April or beginning of May, in drills about three feet apart, and covered lightly. Six quarts of seed is sufficient for an acre of ground. The young plants are of slow growth, and have to be kept free from weeds, and thinned out to about six inches; when large enough, horse cultivators may be used for keeping the ground clean. The second season the flower stalks appear, growing to a height of from four to eight feet. They commence blossoming about the middle of July, and the earliest ones become fit for cutting by the first of August, the whole crop requiring about a month for harvesting.

Knabe Pianos for Brooklyn Schools.

(From the Baltimore Daily News.)

The award of the contract to supply the Brooklyn, New-York, Public Schools with twelve Pianos has been made to Messrs. WM. KNABE & Co., this being the entire number required. The award was made after a test of merit, the Board of Education having determined to secure the Piano which they believed to be the best in the market, without regard to the difference in price. After a thorough examination and comparison, the Knabe Pianos were unanimously chosen.

Darnell's Furrower and Marker supplies the long-felt want of a cheap, reliable and easily managed Field Marker. It pulverizes the soil in the bottom of the furrow so as to leave the ground in the very best condition for planting, and is readily adjusted so as to mark any width from two to five feet, and any depth to six inches. When it is considered that the success of a crop depends largely upon the proper preparation of the seed-bed and the exactness of the markings of the rows, the value of such an implement becomes apparent to any one. H. W. Doughton, Moores-town, N. J., the manufacturer, will send circulars to all applicants.

IMPORTANT.

When you visit or leave New-York City, save Baggage, Expressage, and Carriage hire, and stop at the Grand Union Hotel, opposite Grand Central Depot. 600 elegant rooms, fitted up at a cost of one million dollars, reduced to \$1.00 and upward per day. European Plan. Elevator. Restaurant supplied with the best. Horse cars, stages, and elevated railroad to all depots. Families can live better for less money at the Grand Union Hotel than at any other first-class hotel in the city.

BRAIN AND NERVE FOOD.

FROM THE NERVE-GIVING PRINCIPLES OF THE OX-BRAIN AND WHEAT GERM.

Vitalized Phosphites.—Restores the energy lost by nervousness, weakness, or indigestion; relieves lassitude and neuralgia; refreshes the nerves freed by worry, excitement, or excessive sensitiveness, and strengthens a falling memory. It aids wonderfully in the mental and bodily growth of infants and children. Under its use the teeth come easier, the bones grow better, the skin smoother, the brain requires more readily and sleeps more sweetly. An ill-fed brain learns no lessons, and is peevish. It gives a more intellectual and happier childhood. Not a secret remedy; formula on every label. For sale by Druggists, or mail, \$1. F. CROSBY & Co. 664 & 666 Sixth Ave. New-York.

TAKE NOTICE.

For 50c. (in stamps) 200 Elegant Scrap Pictures. No two alike. F. WHITING, 50 Nassau St., N. Y.

A Present to Every Subscriber TO THE AMERICAN GARDEN.

While we offer a choice of many fine things to those who take time and trouble to aid the publishers in extending the circulation of THE AMERICAN GARDEN, as a recognition of their kind efforts and as a reward or pay for such aid; and, while we intend to and shall make THE AMERICAN GARDEN worth to every reader many times its small cost, yet we desire to give a friendly recognition of some direct kind to each one of our readers as far as possible; and having unusual facilities for securing valuable seeds, etc., desirable for use or for trial, we offer to every subscriber to THE AMERICAN GARDEN his or her own choice of any one of the Seed, Plant, or Bulb parcels named below.

THIS OFFER IS TO EVERY SUBSCRIBER, for one year, whether subscribing singly, or in Premium or other Clubs.

In sending your subscription or giving it to club gatherers, give in each case the letter indicating what you desire.

Our readers will notice that many of the things named are new and rare, and of extraordinary merit. To purchase these (if they could all be bought) would cost 25 to 50 cents each.

POSTAGE FREE. All the articles offered as presents below will be sent postage prepaid.

FLOWER SEEDS.

Directions for culture are given with each package.

A. Wild Garden Seeds.—A half-ounce packet. This novelty in flower gardening, which was first introduced as an AMERICAN GARDEN premium, continues to be a general favorite; and being in greater demand than ever, we retain it among our premiums. The present selection contains over 100 varieties of choice flower seeds, which, in single packets, could not be bought under \$5.00.

B. Single Dahlias.—A packet of seeds carefully selected from over 100 varieties, comprising all the most brilliant and decided colors. If sown in early spring, in pots in the house or in the hot-bed, flowering plants may be had by mid-summer.

C. German Pansies.—A packet of fifty seeds of these lovely flowers, of which one can never get tired. The seeds here offered are from the best and choicest collection in Germany.

D. Asters, Choicest Mixed.—The most desirable and valued varieties of the best German and French strains, are represented in these packets, which are vastly superior to what is generally known as Mixed Asters.

E. Everlasting Flowers.—A mixed packet of 12 distinct varieties. This class of flowers is constantly increasing in favor; and for winter bouquets and decorations generally nothing is more treasured. All are annuals of easy culture.

F. Ornamental Grasses.—A mixed packet of the twelve best varieties. As an accompaniment of flowers, fresh or dried, in bouquets or vases, nothing can be more appropriate and graceful than sprays of ornamental grasses.

VEGETABLE AND FARM SEEDS.

G. Pea, Bliss' Ever-bearing.—A sample packet of this extraordinary new wrinkled Pea, which is now, for the first time, offered to the public. For large yield, excellent quality, and continuance of bearing, it has no equal.

H. Cauliflower, Sea-foam.—One packet. This valuable new variety combines more desirable qualities than any of the older kinds; in size and beauty, and especially in reliability of heading, it excels all others.

I. Water-melon, American Belle.—One packet, now first introduced, and of great value for home use as well as for market. It is very large, early, and of delicious quality.

J. Oats, Black Champion.—A sample package. These Oats were selected from a number of varieties received from Europe, and are of great promise. Selected heads have averaged one hundred and sixty-nine grains. The roots tiller more abundantly than those of any other variety, so that half the quantity of seed usually sown per acre is sufficient.

K. Barley, Imperial.—A sample packet. All reports about this new variety speak in highest terms of its excellence. In yield and quality alike, it is a valuable acquisition.

L. Potato, Tremont.—One tuber. A medium early variety of excellent quality; now offered for the first time.

M. Potato, Iroquois.—One tuber. A large, handsome variety of good quality, large yield, and superior keeping quality; now first offered. Both varieties received First Class Certificates of Merit by the London Royal Horticultural Society at the recent great International Potato Exhibition.

PLANTS AND BULBS.

N. Helianthus multiflorus, fl. plen. Golden Sunflower.—A hardy perennial plant of great beauty, grows about four feet high and bears a profusion of rich golden-yellow flowers of the size of Dahlias.

O. Polyantha Rose, Mad. Cecile Brunner, the Fairy Rose.—This is an entirely new class of Roses, of dwarf habit, with bright flowers of exquisite fragrance; hardy and effective.

P. "Cuviosity," a new early flowering Pompon Chrysanthemum, with brilliant, deep-bright crimson flowers tipped with golden yellow. This choice variety just introduced here is not for sale, but is offered only as a present to our subscribers.

Q. Clematis coccinea (Scarlet Clematis).—One of the most desirable climbers for covering verandas, trellises, arbors, screens, etc., as it grows from eight to ten feet in one season. Its coral-red flowers are produced in great profusion.

R. Eulalia Japonica zebrina.—A remarkably handsome variegated grass, perfectly hardy, growing to a height of six to seven feet, and producing tall, elegant plumes, highly ornamental for vases.

S. Lilium Wallacei, recently introduced from Japan. Flowers four to six inches in diameter, of clear buff-orange color, distinctly spotted with numerous black dots. The bulbs small, but perfectly hardy.

T. Amaryllis Treati, the Fairy Lily.—A delicate, pure-white flower, two to three inches in diameter, borne on slender stems 5 to 6 inches high. Suitable for the garden or house.

U. Strawberry, the Prince of Berries.—3 plants. For complete description and life-size illustration of this really superb Strawberry, see AMERICAN GARDEN, August number.

For other Premiums see General Premium List, mailed free on application.

"ONE CENT WELL SPENT!"

AMERICAN GARDEN PREMIUM LIST.

Very Desirable, Useful, and Excellent

PREMIUMS

INCLUDING

A VALUABLE PRESENT...FREE to Every Subscriber to The American Garden.

SIXTY MOST VALUABLE ARTICLES, all of guaranteed, first-rate Quality, including many wanted in every Home, and by Every Person, Young or Old. Read the Descriptions in the Premium List.

FINE PRESENTS for HOLIDAYS, and all other days; for Wedding Gifts, and to Friends.

(See Premium List.)

DELIVERED RIGHT FREE, no matter how far off TO YOU, FREE, you live! FORTY of the Good Articles in the Premium List will be delivered, CARRIAGE PREPAID, to any place in the United States or Territories, however near or distant, whether given as premiums, or supplied at the prices named.

N. B.—The articles not offered "delivery free," will be carefully packed without charge, and forwarded by express or otherwise, as may be desired. The expenses of carriage will not be great. They can be taken at the office of AMERICAN GARDEN without expense.

GOOD THINGS TO BUY. Aside from any articles obtained free as premiums, almost every one will need, or desire to purchase some of the EXCELLENT THINGS described in the Premium List when they can get them of GUARANTEED QUALITY, and from a RESPONSIBLE SOURCE, and at the LOWEST PRICE they can be obtained anywhere of such excellence. A Price is therefore named with EACH article at which we will supply it delivered FREE, or otherwise, as above provided.

ENTERTAINING AND INSTRUCTIVE READING.—See in the Premium List what is said about "Dips," an amusing scene; six "Watch Items," especially the 7th; about "Washing Made Easy;" "Microscopes;" and a score of other things.

This reading will interest you, aside from what is said of the particular things referred to.

A DOLLAR an HOUR can easily be secured by many persons, LADIES included, (also by BOYS and GIRLS), thus: Show to friends and neighbors a specimen copy of the American Garden, its beauty and usefulness, and low cost. An hour's time should suffice to get 2, or 3, or 4 to take it. This will give you a dollar's worth, or MORE, of the valuable articles in the Premium List—articles better than their money cost. Why! it would pay many persons to continue this as a constant employment, and sell the premium articles received when not needed by themselves. N. B.—Any Premium club may contain subscribers from many Post-Offices.

ALSO NOTE, that in addition to your premium you can offer to every subscriber a FREE Premium, as noted in preceding column. (Several of these Seed and Plant parcels will be worth a full Dollar, or more, leaving the Journal free.)

THE AMERICAN GARDEN is a Large, Beautifully Illustrated Journal, printed on fine paper. It is specially devoted to GARDENING, and Horticultural interests generally. It is of GREAT VALUE in every Garden or Lawn, on the Farm, in the Village, or in the City. The Editors and Contributors are men who write and speak from their own large daily experience and observation. LADIES will find it especially useful in caring for their Flowers and Plants indoors and outdoors. (The Garden is by far the best paying plot on the farm, and adds immensely to the comfort and healthfulness of the home table. THE AMERICAN GARDEN will add many dollars to the products of even the smallest plot.)

What Others Say. Attention is invited to the Border of the first page of the Premium List giving a few of the multitude of similar voluntary expressions, coming from those who are and have been its readers for years past. The Editors and Publishers pledge themselves to make THE AMERICAN GARDEN increasingly valuable by their most earnest efforts, by additional assistance, and by Liberal Outlay for Illustrations, gathering information, etc., etc.

TERMS—One Dollar a year, Mailed Free. This includes the valuable parcel of Plants, Seeds, etc. See preceding column. 3 months' trial trip, 30 cents. Single number, 10 cents. Sample copy and Premium List FREE. Ditto, with colored plate, 10 cents.

Miscellaneous.

BOSTON'S TRADE IN MAY-FLOWERS.

An annual Boston industry that is not very much heard of, but which has developed in the last few years to large proportions, is the sale of May-flowers, or Trailing Arbutus. These sweet-scented blossoms arrive in the city the latter part of March or the first of April, the supply coming at first from Plymouth and the towns in its vicinity. As the season advances, the supply gradually comes from further north, until, in May, New Hampshire and Vermont are the main reliance of the trade.

It is estimated that, last year, from twenty thousand to twenty-five thousand bunches were sold in Boston. One man, who keeps a flower-store in a "hole-in-the-wall" on Temple place, was the originator of the business in the city, ten or a dozen years ago, and his trade has gone on increasing, till last year, when he sold about twelve thousand bunches, mostly by retail. The bunches bring, delivered in Boston, from ten to twenty cents each, according to scarcity and demand, retailing for from twelve to thirty-five cents.

The Arbutus will retain its fragrance and freshness longer than most other flowers, but needs to be packed in wet moss, or in such a way that the stems may be kept moist, to be of full value for market. Although so many were sold last year, the demand kept ahead of the supply, and many more might have been sold had they been obtainable. Here is a hint for some of the bright boys and girls in the hill towns who wish an addition to their pocket-money.—*New England Homestead.*

EUROPE'S GREAT ESTATES.

The largest landed estates in Great Britain, with the one exception of the property of the Duke of Sutherland in Scotland, are exceeded in size by the largest landed estates in Germany and Austria. The Duke's estate has no equal in Germany, but in Austro-Hungary is exceeded by that of Prince Schwartzenberg, who owns fully 120 square miles. Prince J. Liechtenstein owns 104 square miles; Prince Esterhazy, 80; Count Schonborn, 60; while a number of other estates are of nearly equal extent. The largest landed estate in Germany is that of the Duke of Arenberg, a Belgian subject. Of the large native owners, Princes Thurn and Taxis head the list with 55 German square miles (15 German are equal to 70 English square miles); the Duke of Brunswick, 50; Prince Furstenberg, 50; Prince Salm-Salm, 40; Duke of Tallyrand, 35; Prince Pless, 30; Prince Leiningen, 29; four more have 25 German square miles each. Thus there are 22 land-owners in Germany and Austria with estates far larger in point of area than those of British nobles.

INVESTING MONEY.

The first thing a city man does when he becomes rich, says the *Philadelphia News*, is to buy a farm, move into the country, and bankrupt himself trying to raise enough to keep him from starving. A rich countryman, on the other hand, buys a brown-stone front in the city, and becomes interested in stocks with a like result.

REQUIREMENTS OF COUNTRY HOUSES

To sum up the requirements of an isolated, healthful house in the country, says President *Henry E. Fellow*, in his excellent address before the Bedford Farmers' Club, the site should be well and carefully located; it should be dry and properly drained, with walls impervious to dampness from the outside. It should have a good cellar and an unfailling and easily accessible supply of pure drinking-water. The chimneys and fire-places should be large and open when possible, and the sanitary arrangements should be simple, convenient, and not conspicuous to eye or nose; also, all windows should be made to open as readily from the top as from the bottom.

Outside there are some few things which deserve notice—for instance, shade trees, however desirable, should not be too close to the house, nor interfere with its ventilation or supply of sunshine. The high-growing forest trees—Elms, Oaks, etc.—are far better than the low-growing ones, with their dense shade, which retain and give out dampness. The Italians have a proverb with much truth in it, "Where the sun does not enter, the doctor does." Children, in particular, need plenty of sunshine in the living-rooms as well as out-of-doors, and instances are frequent where their health has been injured by too much shade.

NOTICES OF THE PRESS.

THE AMERICAN GARDEN, a monthly illustrated journal, devoted to the gardening interests of America, is a first-class paper in every respect.—*Evangelical Messenger.*

THE AMERICAN GARDEN comes out with a cover which is quite tasty, both in color and design and a decided improvement on its previous appearance, although the GARDEN was always a handsome paper. Each department contains seasonable hints on the work or preparation necessary to running a farm, garden, or orchard. Those who have not seen it can hardly form an idea of the great amount of valuable information each number contains, and should send for a sample copy.—*Bath Daily Times.*

FRIENDLY WORDS.

THE AMERICAN GARDEN continues its high rank as the best of all the agricultural and horticultural papers published.—*S. E. G., Corry, Pa.*

THE AMERICAN GARDEN is worth ten dollars a year to us. Will try to reciprocate by sending you new subscribers.—*R. C., Dalton, Mass.*

I am well pleased with your excellent monthly. It looks well, reads well, and best of all, is full of practical knowledge.—*Mrs. M. J. P., Lynn, Mass.*

I am very much pleased with THE AMERICAN GARDEN. Its practical articles and sound advice make the paper invaluable.—*G. B. W., Geneva Lake, Wis.*

I find THE AMERICAN GARDEN quite popular among horticulturists. It is practical and reliable, and I think will attain a large circulation.—*L. B. P., Tallmadge, Ohio.*

I want you to send me all the numbers of THE AMERICAN GARDEN for this year. I forgot to renew my subscription, but in looking over some old numbers, I like them so much that I find I cannot get along without the paper.—*S. W. C., Fred-erickton, Md.*

THE AMERICAN GARDEN is one of the best papers I get; its articles are timely and reliable, and written by some of our most practical horticulturists. It ought to exert a healthy influence on horticulture throughout the country.—*M. M., Youngstown, O.*

I am a now hand at market gardening, and THE AMERICAN GARDEN helps me in so many ways, and is so useful to me, that I can't do without it and must have it as long as I can pay for it. It is worth to me many times its cost.—*G. R., Houston Co., Minn.*

R. L. SPENCER CO., Hartford, Conn.

HAMMOND'S SLUG SHOT, AN INSECTICIDE AND FERTILIZER

Ready for use and safe.

GUARANTEED TO DESTROY

Potato Bugs, Chinch Bugs, Rose Bugs, Slugs,

Aphis Lice, Worms, Caterpillars, and the Striped Bug upon Melons, Cucumbers, Squash and all insects injurious to Grape Vines, Cabbage, Tobacco, Cotton, or Egg Plants, Currants, Fruit or Ornamental Trees, Rose Bushes, and all Shrubs, Greenhouse, and Hardy Flowering Plants.

SLUG SHOT was prepared at first solely to destroy the Potato Bug in gardens, but its valuable properties for the destruction of all kinds of insects, caterpillars, and other vermin, have induced the inventors to manufacture it on a large scale, by which it is offered at a reduced price (as cheap or cheaper than Paris Green), and always of uniform strength, and ready for immediate use without the trouble of mixing.

SLUG SHOT contains, in minutest quantity, POISON! destructive to all insect life, which is most thoroughly diffused through natural and chemical fertilizers, and kills the bug in all stages of its growth. The insect eats it in the minutest quantity, and then appears to become paralyzed, often dying on the leaf without falling to the ground.

It is an impalpable powder, and does not harm vegetation; on the other hand, it is a manure. Dust it on the plants plentifully, either by hand or with a dusting-tin. You can easily make a duster by taking an old fruit can, perforating the bottom, and nailing the can to a stick.

QUANTITY TO AN ACRE.

When plants are small, about 20 pounds are needed; or, take a handful and throw it over each hill, covering the leaves. It does no harm to plants, but, on the contrary, invigorates them greatly.

The color and odor of SLUG SHOT prevent it in any way being mistaken or used for wrong purposes, and its composition is such that it is out of the question for a human being or quadruped to take enough to do any harm. Mr. Hammond, the originator, and his men have worked days and weeks in it without any ill effects whatever.

Pamphlets, giving a full description, with directions for use and certificates from those who have used it for the various purposes for which it is recommended, mailed free to all applicants.

SLUG SHOT is in strong, neat packages, properly labeled, weighing respectively 5, 10, and 15 pounds each. These packages are packed in barrels for the trade. The barrels will hold from 200 to 215 pounds net. Each barrel has a large poster and 100 circulars.

The price is a half cent less per pound when ordered in bulk than it is in packages. Prices, in packages, 5 lbs. 30 cents; 10 lbs. 50 cents; 15 lbs. 75 cents; in barrels in bulk, 4 1/2 cents per pound. Slug Shot cannot be sent by mail.

Prices to the trade given upon application.

Manufactured by B. HAMMOND & CO. Mt. Kisco Paint Works, Mt. Kisco, N. Y.

B. K. BLISS & SONS, Wholesale Agents,
34 Barclay Street, New-York City.

To Consumptives.—Many have been happy to give their testimony in favor of the use of "Wilbor's Pure Cod Liver Oil and Lime." Experience has proved it to be a valuable remedy for Consumption, Asthma, Diphtheria, and all diseases of the Throat and Lungs. Manufactured only by A. B. WILBOR, Chemist, Boston. Sold by all druggists.

FUN, HEALTH & PROFIT.

Gardening Made Easy for GIRLS AND BOYS.

"No flowers so beautiful, nor vegetables so luscious, as those grown by my children." PARENTS, let your girls and boys have gardens of their own; pay them for the flowers and vegetables they raise as you would your florist or green-grocer. It will not only inculcate habits of industry, thrift, and independence, but will give them ruddy cheeks, bright eyes, healthy appetites, and strong constitutions, for which they will bless you in after years. We have made up Special Collections of Flower and Vegetable seeds for children—varieties of easy cultivation and of fine quality. Simple directions for cultivation accompany each package, so that any child of ordinary intelligence cannot fail of success.

- Collection A, Junior, contains six choice varieties of flower seeds (our selection). Price, 25 cts.
- Collection B, Junior, contains thirteen beautiful varieties of flower seeds (our selection). Price, 50 cts.
- Collection C, Junior, contains six varieties of vegetable seeds (our selection), including Bliss's American Wonder Pea. Price, 25 cts.
- Collection G, Junior, contains thirteen choice varieties of vegetable seeds (our selection), including Bliss's American Wonder Pea. Price, 50 cts.
- Collection H, Junior, contains twenty-five varieties of vegetable seeds (our selection), including Bliss's American Wonder Pea. Price, \$1.00.
- Collection M, Junior, six summer flowering bulbs, containing 1 White Lily, 1 Tigridia (Tiger Flower), 1 orange, 1 Tigridia scarlet, 1 Tuberosa, 2 Gladioli, different colors. Price, 50 cts.
- Collection N, Junior, fourteen summer flowering bulbs, containing 1 White Lily, 1 Tiger Lily, 4 Tigridias, 2 Tuberoses, and 6 Gladioli, different colors. Price, \$1.00.
- Collection R, Junior, containing 1 Rosa, 1 Geranium, 1 Petunia, and 1 Chrysanthemum. Price, 50 cts.
- Collection S, Junior, containing 1 Rosa, 2 Geraniums, 1 English, 1 Carnation, and 2 Verbenas. Price, 75 cts.
- Collection T, Junior, containing 2 Roses, 2 Geraniums, 2 Petunias, 2 Carnations, and 2 Verbenas. Price, \$1.00.

B. K. BLISS & SONS, 34 Barclay ST. New-York.

STERLING NOVELTIES OF RARE MERIT.

New Flower Seeds, New Vegetable Seeds, New Corals, New Potatoes, New Seeds for the New and Rare Plants for the Garden and Conservatory, etc., etc. Our NEW ILLUSTRATED CATALOGUE OF NOVELTIES, containing a descriptive list of everything that has proved really desirable, introduced within the past two years, is now ready, and will be mailed free to all applicants.
B. K. BLISS & SONS, 34 Barclay Street, New-York.

NEW PANSY—BLISS'S PERFECTION.

AWARDED A FIRST-CLASS CERTIFICATE BY THE NEW-YORK HORTICULTURAL SOCIETY IN THE SPRING OF 1883.

Our previous efforts to improve this ever-popular flower, although attended with unprecedented success, are eclipsed by a new strain, BLISS'S PERFECTION, that we now have the pleasure of introducing, believing it to be the nearest to perfection of anything yet offered. In the colored front-piece of our Handbook, our artist has attempted to reproduce some of the types of this strain; but, beautiful as are these illustrations, we assure you that the originals far surpass them, and the copies, instead of being exaggerations, convey but a faint idea of the perfection of form and exquisite delicacy of shading in the flowers themselves. For variety of markings, beauty of form, large size, good substance, and splendid satiny texture, BLISS'S PERFECTION PANSY is unexcelled.

Per packet (50 seeds), 50 cents; 5 packets for \$2.00.

Bliss's Illustrated Potato Catalogue. — Contains a list of 500 varieties of Potatoes, embracing new and very promising varieties, with explicit directions for culture, and much other valuable information respecting this indispensable esculent. 10 cents.

Randolph's Hand Seed-Sower.

For sowing all kinds of small Garden Seeds with accuracy and dispatch. It is easily operated by a lady or a child of ordinary intelligence, with a little practice. Its cost is trifling compared with the advantages resulting from its use. The saving in time and seeds will undoubtedly repay the outlay in the planting of a single week. Its construction is so simple, that it is not liable to get out of order. Descriptive Circulars mailed to all applicants. Price, \$1.25 each. Sent by mail, post-paid, to any address, for \$1.50. A liberal discount to agents.

B. K. BLISS & SONS, 34 Barclay St., N. Y.

THE GARDENER'S CHRONICLE.

REPORTS OF EXHIBITIONS, REVIEWS OF BOOKS, AND NOTICES OF ALL HORTICULTURAL MATTERS OF CURRENT INTEREST.

HOME, COLONIAL, AND FOREIGN CORRESPONDENCE.

This large and handsomely gotten-up Journal is everywhere recognized as one of the foremost Weekly Horticultural publications of the World. SUBSCRIPTIONS FOR THE UNITED STATES,

INCLUDING POSTAGE,

\$6.50 for One Year.

Subscriptions may be sent to

THE AMERICAN GARDEN,

34 BARCLAY STREET, New-York.

The Gardener's Chronicle (London) and THE AMERICAN GARDEN, both sent one year, to any address on receipt of \$7.00.

For further description of above and other Novelties, see our HAND-BOOK FOR THE FARM AND GARDEN (mailed for 6 cents to cover postage). Purchasers ordering seeds to value of \$5.00 in one order, will be entitled to a copy of THE AMERICAN GARDEN for one year.

A NEW WATER-MELON—AMERICAN CHAMPION. FIFTY DOLLARS IN PREMIUMS.

WATER-MELON—AMERICAN CHAMPION.

"They carry splendidly; the specks, rots, and breaks are much below the average." "In keeping quality there is no other kind to approach it." "Although the market was very dull, these were engaged several days ahead, at advanced prices." After hearing these endorsements from men who are first authorities in the fruit trade, it will be evident to every one that no other variety combines so many valuable qualities as the American Champion. Price, 25 cents per packet; 5 packets for \$1.00.

FIFTY DOLLARS IN PREMIUMS,

To be awarded as follows:—\$25.00 to the grower of the largest American Champion Water-melon; \$15.00 to the grower of the second largest; and \$10.00 to the grower of the third largest. All reports, which must be signed by three witnesses and sworn to before a Justice, to be sent us by October 15th, 1884, and on November 1st the cash will be forwarded to those entitled to it. We reserve the right of ordering the prize-winning Melons shipped to us, for exhibition, expenses of transit to be defrayed by us.

BLISS'S AMERICAN WONDER PEA.

The Earliest Dwarf Wrinkled Pea in Cultivation.

Voluntary Testimony in favor of Bliss's American Wonder Pea. From Rev. Henry Ward Beecher.—"Your peas are wonderful, none others so good. I do not mean to plant another year any others, early or late. They beat the Alpha in earliness, and out of slight in flavor." From Hon. Marshall P. Wilder, Pres. American Entomological Society, Ex-Pres. U. S. Agricultural Society.—"My AMERICAN WONDER is a wonder, equal in sweetness and richness to the Champion of England, which is all that could be desired."

Extra early—requires no bushing—exquisite flavor. The best variety for forcing under glass, and the best for early sowing in the garden. This splendid variety is the result of a cross between the Champion of England and Little Gem, and combines all the good qualities of both of its parents, with the additional ones of superiority in flavor to the Champion and of greater productiveness than the Little Gem. Peas are ready for the table in thirty-three days from date of planting. Thirty to forty pods have been counted on some vines, and nine large peas in some of the pods, and every pod is well filled. The vine grows from eight to ten inches high, according to the soil and season. After a more extended trial than any previous introduction was ever subjected to, Bliss's American Wonder Pea has been pronounced by press and public the most desirable wrinkled variety in cultivation, while, in point of quality, the best horticultural judges in the world maintain that it is surpassed by no other variety. CAUTION.—Each succeeding season the necessity becomes greater of cautioning the public against spurious American Wonder peas. We have on different occasions secured several packets from dealers who claimed to supply the genuine BLISS'S AMERICAN WONDER PEA, which, upon trial, proved to be entirely unlike it. We are within the mark when we say hundreds of bushels other than the genuine variety have been sold. As there seems to be no protection from such fraud, it is to your interest to procure a supply from head-quarters; for unless you obtain the GENUINE Bliss's American Wonder, you will never know why it is that, wherever grown, it has been pronounced by all the earliest, the most productive, and best-flavored variety in cultivation. Per pkt., 10 cents; pint, 40; quart, 75, by mail, post-paid. When delivered at our store or sent by express at purchaser's expense: pint, 30 cents; quart, 50; peck, \$2.50; bushel, \$8.00. Prices for larger quantities on application.

NEW EARLY RHUBARB—"PARAGON."

This variety, although now offered for the first time in this country, has had extensive trial in England, and has more than verified the claims made for it. It is unquestionably one of the finest varieties of Rhubarb ever offered, being the earliest of all and wonderful in fully prolific. The crowns and stalks are produced in such profusion that more than two are produced in each crown, and can be gathered from "PARAGON" than from any other sort. It has also the qualification over all others that IT NEVER SEEDS, a claim that we have tested and found well sustained last Summer. The leaves are remarkably small, while in color the stalks are a beautiful bright red, and in flavor unsurpassed. Price, strong plants, 75 cents each; \$7.50 per dozen.

New Varieties Potatoes.

Tremont, Mayflower, Iroquois, Charter Oak, Dakota Red.

Choice Varieties of 1883, etc.

Rosy Morn, Rubicund, Early Sunrise, Tyrian Purple, Garfield, Rural Blush.

For description and price of the above, send for our Illustrated Potato Catalogue, 48 pages, which contains an illustrated list of the leading varieties in cultivation, with much useful information upon their culture. Mailed to all applicants inclosing 10 cents. Regular customers free.

THE AMERICAN GARDEN (mailed for 6 cents to cover postage).

BEATTY'S PARLOR ORGANS ONLY \$49.75

Latest Style, No. 1526. Dimensions—Height, 74 ins., Depth, 26 ins., Length, 50 ins., Weight, boxed, about 450 lbs.

Regular Price \$95.00 Without Stool, Book and Music,

25 STOPS.—1. Cello, 8 ft. tone; 2. Melodia, 8 ft. tone; 3. Clarabella, 8 ft. tone; 4. Manual Sub-Bass, 16 ft. tone; 5. Bourne, 16 ft. tone; 6. Saraphone, 8 ft. tone; 7. Viol di Gamba, 8 ft. tone; 8. Diapason, 8 ft. tone; 9. Viola Dolce, 4 ft. tone; 10. Grand Expression, 8 ft. tone; 11. French Horn, 8 ft. tone; 12. Trump Solian; 13. Vox Humana; 14. Echo, 8 ft. tone; 15. Dulciana, 8 ft. tone; 16. Harp, 8 ft. tone; 17. Vox Celeste, 8 ft. tone; 18. Volina, 4 ft. tone; 19. Vox Jubilante, 8 ft. tone; 20. Piccolo, 4 ft. tone; 21. Coupler Harmonique; 22. Orchestral Forte; 23. Grand Organ Knee Stop; 24. Right Organ Knee Stop.
This Organ is a triumph of the organ-builder's art. IT IS VERY BEAUTIFUL IN APPEARANCE, BEING EXACTLY LIKE CUT. The Case is solid Walnut, profusely ornamented with hand-carving and expensive fastenings. The Pipe-Top is of the most beautiful design extant. It is deserving of a place in the millionaire's parlor, and would ornament the boudoir of a princess.
FIVE SETS OF REEDS.—Five Octaves, handsome appearance. It will not take of the dirt, and it contains the Sweet VOIX CELESTE STOP, the famous French Horn Solo Combination, New Grand Organ Right and Left Knee Stops, to control the entire motion by the Knee, if necessary. Five (5) Sets of GOLDEN TONGUE REEDS, as follows: a set of powerful Sub-Bass Reeds, set of 3 Octaves of VOIX CELESTE, one set of FRENCH HORN REEDS, and 2 1/2 Octaves each of regular GOLDEN TONGUE REEDS. Besides all this, it is fitted up with an OCTAVE COUPLER, which doubles the power of the instrument. Lamp Stands, Pocket for Music, Beatty's Patent Stop Action, also Sounding Boards, &c. It has a Sliding Lid and conveniently arranged Grands for moving. The Bellows, which are of the upright pattern, are made from the best quality of rubber cloth, are of great power and are fitted up with steel springs and the best quality of pedal straps. The Pedals, instead of being covered with carpet, are polished metal of neat design, and never get out of repair or worn.

SPECIAL TEN-DAY OFFER TO READERS OF The American Garden

If you will remit me \$49.75 and the annexed Coupon within 10 days from the date hereof, I will box and ship you this Organ, with Organ Bench, Book, etc., exactly the same as I sell for \$95. You should order immediately, and in no case later than 10 days. One year's test trial given, and a full warranty period after one year's use. **GIVEN UNDER MY HAND AND SEAL**

May
5th,
1884.

Daniel F. Beatty

COUPON! On receipt of this Coupon from any readers of THE AMERICAN GARDEN \$45.25 and \$49.75 in cash by Bank Draft, Post Office Money Order, Registered Letter, Express prepaid, or by Check on your Bank, if forwarded within 10 days from date of receipt of this Coupon for \$49.75 for Organ, with Bench, Book, etc., providing the cash balance of \$49.75 accompanies this Coupon, and I will send you a receipted bill in full for \$95, and box and ship you the Organ just as it is advertised, fully warranted for six years. Money refunded with interest from date of remittance if not as represented after one year's use. (Signed) DANIEL F. BEATTY.

FREIGHT PREPAID. As a further inducement for you, (provided you order immediately within the 10 days) I agree to prepay freight on the above Organ to your nearest railroad freight station any point east of the Mississippi River, or that far on any going west of it. This is a rare opportunity to place an instrument, as it were, at your very door, all freight prepaid, at manufacturer's wholesale prices. Order now; nothing saved by correspondence. **HOW TO ORDER.** Enclosed find \$49.75 for Organ. I have read your statement in this advertisement and I order one on condition that it must prove exactly as represented in this advertisement, or I shall return it at the end of one year's use and demand the return of my money, with interest from the very moment I forwarded it, at six per cent, according to your offer. Be very particular to give Name, Post Office, County, State, Freight Money Order, Registered Letter, Express prepaid, or by Bank Check. You may accept by telegraph an instant day and remit by mail on that day, secured with this special offer. I desire this magnificent instrument intrusted without delay, hence this special price, providing order is given immediately. Address me call upon } DANIEL F. BEATTY, Washington, New Jersey, the Manufacturer.

THE MAPES COMPLETE MANURES.

CAULIFLOWERS, 249 BARRELS ON ONE AND A QUARTER ACRES.

OATS, 80 BUSHELS PER ACRE.

My land is much improved by the use of the Mapes Manure.

E. E. MOSIER, Riverhead, Suffolk Co., N. Y., December 18, 1883, writes: "I have used your fertilizers for years, and I have good reason to be well satisfied with the result."

"For potatoes I use from four to six bags per acre, and never have less than 200 bushels per acre without other manure."

"With your Canillower Manure I have good success. My yield this year on one and a quarter acres was 249 barrels."

"For oats I used two bags 'A' Brand per acre, and they yielded eighty bushels per acre. The man that thrashed them says they were the heaviest-filled oats he ever thrashed."

"In the spring of 1882 I bought one bag each of four different kinds of fertilizers to test on my potatoes. The fertilizers were weighed, so that each competing row had the same value of manure. In the fall I weighed the potatoes; those with Mapes were far the best in yield and size."

"I can see that my land is much improved by the use of the Mapes Manures."

Send postal for pamphlet for results on Vegetables, Turnips, Tomatoes, etc., etc.

Address THE MAPES FORMULA AND PERUVIAN GUANO COMPANY, 158 Front Street, New-York.

POTATOES, CARROTS, PARSNIPS, SWEET CORN AND CABBAGES.

Used the Mapes Fertilizers for several years, and am perfectly satisfied with the results.

J. I. LOTT, Canarsie, Kings Co., N. Y., December, 1883, reports: "Potatoes: Planted middle of April with 900 lbs. per acre of the Mapes Potato Manure in the drills. Season wet and cold, causing late crop. The yield was 200 bushels per acre, dig in July; good, large, and smooth."

"Carrots: With 700 lbs. per acre of 'A' Brand, applied alone, yielded 800 bushels per acre."

"Parsnips: With 600 lbs. per acre of 'A' Brand alone, gave about 500 bushels per acre. Sweet corn and cabbage were both good crops."

"I have used your fertilizers for several years, and am perfectly satisfied with the results."

POTATOES AND CAULIFLOWER.

Several years' experience. Had the best crops of Potatoes and Cauliflower this season I have ever raised.

JOHN BOUTCHER, Cutchogue, L. I., reports to S. P. TUTTILL, Mattituck, January, 1884:

"I don't think there is any manure to be compared to the Mapes; have used them several years, and don't want any other kind to use. Had the best crop of potatoes and cauliflower this season I ever raised."

EVERY ONE who OWNS a WAGON WANTS a EUREKA FOLDING CANOPY TOP!

Folds up like an Umbrella. Weighs less than 12 lbs. Can be taken off or put on in 5 minutes. Made in sizes to fit business wagons. Send for illustrated circular and price list. Agents wanted everywhere.

D. G. BEERS & CO., Patented & Mfg. Sandy Hook, Conn.

NEW 'Singer' Model Sewing Machines only \$15

Including an \$8.00 set of extra attachments, of 9 pieces and needles, oil and usual outfit of 12 pieces with each. Guaranteed perfect. Warranted 5 years. Handsome, durable, quiet and light running. Don't pay \$20 to \$30 for machines no better. We will send ours anywhere on trial before paying. Circulars free. Save \$15 to \$35 by addressing GEO. PAYNE & CO., 47 Third Ave., Chicago, Ills.

KEMP'S MANURE SPREADER PULVERIZER and CART COMBINED.

Greatest Agricultural Invention of the Age! Saves 90 per cent. of labor. Doubles the value of the Manure. Spreads evenly all kinds of manure, broadcast or in drill, in one-half time required by hand. Illustrated Catalogues free. KEMP & BURPEE MFG CO., Syracuse, N. Y.

EXCELSIOR AND CLIPPER LAWN MOWERS HAND MOWERS GUARANTEED BEST & CHEAPEST LARGE REDUCTION IN PRICE

10 TO 20 IN. 25 TO 40 IN. CHADBORN & COLDWELL MANUF'G CO., NEWBURGH, N. Y.

CLUB ORDERS.

TEA CLUB ORDERS.

We have made a specialty for seven years of giving away as Premiums, to those who get up clubs for our Teas, Dinner and Tea Sets, Gold Hand Sets, Silverware, etc. Teas of all kinds, from 50 to 75 cents per pound. We do a very large Tea and Coffee business, besides sending out from 60 to 90 CLUB ORDERS each day. SILVER-PLATED CASTERS as Premiums with \$7, \$7 and \$10 orders. WHITE TEA SETS with \$10 orders. DECORATED TEA SETS with \$15. GOLD BAND or MOSS ROSE SETS of 44 pcs., or DINER SETS, of 106 pcs., with \$20 orders, and a Host of other Premiums. Send us Postal and mention this Paper, and we will send you full Price and Premium List. Freight Charges average 75 cents per 100 lbs., to points West. GREAT LONDON TEA CO., 805 Washington Street, Boston.

PRUNING KNIVES,
By Mail, Post-paid.

This large elegant knife (like cut), 75 cts.; one a little smaller and lighter, 50 cts.; a fine 2-Blade Jack-Knife, brass lined, 60 cts.; 3-Blade Heavy Knife, \$1.00. Boy's 1-Blade, 25 cts.; 2-Blade, 35 cts. Gent's fine 3-Blade, Ivory Handle, \$1.00; Pearl Handle, \$1.25.

Lady's 1-Blade, Ivory Handle, 25 cts.; 2-Blade, 50 cts.; 3-Blade, 75 cts. A 3-Blade & Butcher Razor \$1.00. Remember all our Blades are made of the Best quality of Razor Steel and warranted, we replace all that are soft and sawy. Catalogue free.

THURSTONE & BRIGHAM, Buffalo, N. Y.

"ACME" PULVERIZING HARROW,

AGENTS WANTED. It is the best selling tool on earth.

Clod Crusher, and Leveler.

The "ACME" subjects the soil to the action of a Steel Crusher and Leveler, and to the Cutting, Lifting, Turning process of double gangs of CAST-STEEL COULTERS, the peculiar shape and arrangement of which give immense cutting power. Thus the three operations of crushing lumps, leveling off the ground, and thoroughly pulverizing the soil are performed at the same time. The entire absence of Splkes or Spring Teeth avoids pulling up rubbish. It is especially adapted to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that cuts over the entire surface.

We make a variety of Sizes working from 4 to 15 Feet Wide.

DO NOT BE DECEIVED. Don't let your dealer palm off a base imitation or some inferior tool on you under the assurance that it is something better, but **SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL.** We will send the double gang Acme to any responsible farmer in the United States on trial, and if it does not suit, you may send it back, we paying return freight charges. We don't ask for pay until you have tried it on your own farm.

Send for Pamphlet containing Thousands of Testimonials, from 40 different States and Territories. BRANCH OFFICE: HARRISBURG, PA. **NASH & BROTHER,** Manufacturing and Principal Office: MILLINGTON, NEW JERSEY. N. B.—PAMPHLET "TILLAGE IS MANURE" SENT FREE TO PARTIES WHO NAME THIS PAPER.

S. L. ALLEN & CO. 127 & 129 Catharine St., Phila.

The **NEW TOOLS** we offer this season, together with recent improvements, place the "PLANET Jr." Farm and Garden Implements beyond all Competition.

NEW CATALOGUE

SEND NOW, if you are interested in Farming, Gardening or Trucking, for our NEW CATALOGUE, containing 32 pages and over 40 illustrations, describing fully the "PLANET Jr." Horse Hoes, Cultivators, Seed-Drills, Wheel-Hoes, Potato-Diggers, Etc., Etc.

The American Garden

A Monthly Journal of Practical Gardening.

DR. F. M. HEXAMER, Editor.

B. K. BLISS & SONS, Publishers.

Vol. V.

NEW-YORK, JUNE, 1884.

No. 6.

THE MONTH OF ROSES.

Rose and Strawberry exhibitions are the order of the month in many of our large cities, and great are the expectations of enthusiastic competitors who, for a year or more, have made preparations for the occasion and assiduously nursed and petted their fondlings which shall bring them honor and prizes. The beneficial influences of these flower-shows in educating and refining taste are readily perceived, but it is a mistake to confine them to our cities, for nowhere are they more needed and will they be productive of more salutary results than in the country.

The isolation and seclusion of American country life are to many a serious counterbalance of its enjoyments and pleasures, and not unfrequently are they the cause for exchanging a beautiful rural home, surrounded with ennobling and healthgiving influences, for the social advantages of a confining city residence. And there is nothing very surprising in this, for however city-weary one may be, and how much one may be able to enjoy the charms of solitude and the companionship with Nature, man is, nevertheless, a social being, and, even among the most charming natural surroundings, needs, for the completeness of his happiness, contact with his fellow-beings, interchange of thoughts and opinions with persons of similar tastes and inclinations, and the sympathy of congenial friends and neighbors. Monotony and loneliness, however, are not necessary adjuncts to country life, and, with a little effort, pleasant and agree-

able social relations may be formed in almost any not too sparsely settled neighborhood.

We do not know of anything more productive of good feeling and pleasant social pastime among persons not intimately acquainted with each other, than amateur flower and fruit exhibitions, and there is no

good reason why every town, or county at least, should not have one or more every year. It is not necessary, in fact, not desirable, to try to imitate large city exhibitions. The aim should be to bring together as many of the floral and pomological products of the neighborhood as possible, for comparison, instruction, and friendly rivalry. However

small the beginning may be, if those who undertake it are in earnest, it will soon increase in interest and importance, and become the nucleus and the means for mental benefit, sociability, and the improvement and embellishment of the vicinity. Influential horticultural societies, farmers' clubs, and village improvement associations have grown up from such small beginnings; and now is the time to organize and arrange for a neighborhood Rose and Strawberry Show.

FRIENDLY WORDS.

THE AMERICAN GARDEN improves with every number.—Mrs. L. S., Fair Haven, O.

Allow me to congratulate the editor and publishers on the excellence and beauty of THE AMERICAN GARDEN.—John E. Russell, Secy. Mass. State Board of Agriculture.

I take more interest in reading THE AMERICAN GARDEN than in any of the many similar papers I receive. It is the horticultural monthly of America.—H. G., Highland Park, Ills.

THE AMERICAN GARDEN is a superior publication, as might be expected under the editorship of so common-sense and experienced a horticulturalist as Dr. Hexamer.—J. M., Bedford, N. Y.

Your paper is as excellent as it is beautiful. I have taken for years several horticultural papers, but for practical everyday work in the garden and greenhouse, THE AMERICAN GARDEN stands at the head of all. Long may it stand.—Mrs. M. P., Lynn, Mass.

ORIGIN OF THE MOSS ROSE.

(From the German of Thrummacher.)

The angel of the flowers, one day,
Beneath a Rose-tree sleeping lay,—
That spirit to whose charge 'tis given
To bathe the young buds in dew from heaven:
Awaking from his light repose,
The angel whispered to the Rose,
"For the sweet shade thou'st given to me,
Ask what thou wilt, 'tis granted thee."

The Rose replied with heightening glow,
"On me another grace bestow."
The angel paused in silent thought,
"What grace was there that flower had not?"
'Twas but a moment, o'er the Rose
A veil of Moss he lightly throws;
And, robed in Nature's simplest weed,
What other flower can this exceed?

The Vegetable Garden.

SEASONABLE HINTS.

Frequent Tillage is as essential to success in the garden as manure, and in many cases even more so. Successful market gardeners bestow, not seldom, more labor on some crops in a single week than many a farmer gives to his Corn and Potatoes in a whole season.

In this connection it should be borne in mind that with shallow-rooted plants deep cultivation must be avoided. In the field, cultivators and harrows should be used, instead of deep-running plows; and, in the garden, prong-hoes and rakes, instead of hoes.

Shallow Cultivation at short intervals is one of the most efficient means to counter-balance the effects of drought. The coat of loose soil which is thereby spread over the roots serves as an excellent mulch, as effective nearly as a covering of straw. Careful experiments made at the Missouri Agricultural College, in this regard, leave no doubt in this matter, and lead Professor Sanborn to state that "tillage, to conserve moisture, must be shallow, not over two inches in depth, the aim being to get a thin layer of dry surface soil that will act as a non-conductor of moisture between the dry air above and the moist surface below. Hence, deep tillage of surface-rooted crops, like Corn, is an erroneous practice, founded in erroneous views. Plowing out Corn involves too deep tillage in dry weather, but adds to the mischief by severing the roots of Corn needed at such times. Our double-shovel plows work too deeply. Our true policy in drought is frequent and shallow tillage."

Assisting Growing Crops.—It is sometimes observed that in ground well enriched with stable manure at the time of planting, the crops do not make as vigorous growth as might be expected. The principal cause of this is that the fertilizers applied are not yet in an available condition; they are in too crude a state to become absorbed by the fine feeding roots of the plants.

Young plants, as well as young animals, require their food in the most digestible form. You may feed a baby to death with solid food, but if you wish to nourish it, you must give it milk. It is similar with vegetables; a young plant may starve while surrounded with crude, dry manure, while a fraction of it in solution would give nourishment and life. An occasional dose of liquid manure acts like magic upon weak plants.

Hill-side Planting.—In gardens with sloping grounds the rows run frequently parallel with the crest of the hill, so as to make them as level as possible. This plan, although it affords easier cultivation, especially when horses are employed, is very defective in that it subjects the ground to more danger from water than when the rows follow the slope of the hill. In the latter case the water that falls during a heavy shower is distributed and carried down the hill in a great many small channels, while in the other it is held back in the furrows until the ridges become insufficient to hold it back. The entire bulk of water thus accumulated breaks through, rushes down the slope to the serious damage of the crops, washing away the most valuable portions of the soil.

THE GREEN GLOBE ARTICHOKE.

Although the Green Globe Artichoke may be successfully grown in our climate, it is very rarely seen either in our gardens or our markets. In France it is a very popular vegetable, and almost every garden has its Artichoke bed. The plant requires good soil, but demands very little attention after the bed is once started, as it is a perennial, and requires to be replanted but once in five or six years.

The plant is quite peculiar, and is worth growing for its appearance alone. It resembles slightly a much overgrown Bull Thistle, the flower-stalks growing five or six feet tall. The flower-heads are the most important part of the plant, being the part used for food. These are about the size, and somewhat of the appearance of a small Pine-apple. The receptacle, or "bottom," of the flower-head, with the thicker portion of the scales that inclose the flowers, are the parts most used. These are boiled and made into a salad, with vinegar, oil, and salt, or are very often eaten raw as salads. The taste is rather peculiar and delicate, and the dish is prized by many persons.

The Artichoke succeeds best in a deep,

THE GREEN GLOBE ARTICHOKE.

rich, rather moist, peaty soil, though almost any rich garden soil will grow it successfully. The plants may be grown from seed by starting them early in the hot-bed; but a better way is to procure suckers from an old bed, and set these out in the place where they are to remain. Old plants throw out suckers from their main root, just below the surface of the ground. These may be removed by cutting them off with a small section of the old root, and if set out, will grow and make fine plants the first season, many of which will form flower-heads. When grown from seed, the varieties do not always come true, and it takes a year longer for the plant to form the flower-heads.

The Artichoke needs no winter protection in the Southern States, but in the latitude of New-York it is necessary to cover the bed with straw or leaves to the depth of six or eight inches. The heart of the plant should not be covered too deeply, or it will cause it to smother. It is best to put the litter around, rather than upon the plants.

The French catalogues name several varieties of Artichoke. Our seedsmen usually offer but the one shown in the illustration.

The leaf-stalks are sometimes tied up as we tie Endive, and earthen up as we treat

Celery for blanching. In a month or six weeks the inner leaves are nicely blanched, when they are said to make a very palatable article of food, being used both raw and cooked; blanching, however, is usually practiced only on old plants that are not needed. The leaves are cut off in midsummer, about six inches above the ground, which causes the plants to throw up a growth of young and tender leaves, which are blanched in autumn.

The Artichoke begins to form its heads in the latter part of summer, and continues to do so until frosts. It is said that if the undeveloped flower-heads are cut late in the fall, and their stems placed in moist sand, they will remain fresh and fit for use until January or longer.

"ELM."

POULTRY MANURE.

From my long experience in gardening, I find nothing more essential to success than a plentiful supply of manure. Poultry manure especially is very valuable, but gardeners do not seem to appreciate it sufficiently. It is identical in action with guano, or nearly so, being very rich in ammonia, and therefore a very powerful plant stimulant.

The droppings of hens, turkeys, and geese should be carefully saved and preserved. Do not think that because the quantity is small it is not worth the trouble of collecting. Professor Norton says:

"Three or four hundred pounds of such manure, that has not been exposed to rain or sun, is equal in value to from fourteen to eighteen loads of stable manure."

It should be composted with muck, turf, decayed leaves, or other absorbents, kept dry, stored in barrels, reduced to a powder, and applied in the hill; or it may be used as a top-dressing.

I carefully save all I can in this way, and apply it to all garden vegetables. A handful or two worked in a hill of Tomatoes, Cabbage, Cucumbers, or any vegetables, in fact, will give them such a vigorous start that the effect will be visible throughout the season. Such compost mixed in the soil, even after the Tomato plants are set out, will produce ripe fruit ten days earlier than three times the quantity of any other fertilizer I am acquainted with. Or it may be dissolved in water, in a hogshead, and used for watering the plants. In solution it acts even more powerfully than in the dry state.

THOS. D. BAIRD.

RAISING CAULIFLOWERS.

A correspondent of the *N. Y. Tribune*, who succeeded in raising splendid Cauliflowers last season, gives his method as follows: "I spaded very deeply a deep, rich piece of ground, inclining to moisture, and turned in all the rich old rotted manure I could well use. The plants were set out May 1, after being wintered in cold frames. When the weather became dry, I occasionally poured on each plant a little diluted manure water, so that by late summer the heads began to form, and finer heads I never saw. They headed successively until freezing weather. As soon as the white flower-buds, or crown, showed, the leaves were immediately drawn over them and loosely tied, thus preserving the milk-white color and tender texture. Cauliflowers delight in a deep, rich soil."

TARRAGON.

Artemisia Dracunculus.

A hardy herbaceous, perennial plant, cultivated for its foliage, which has a pleasant, peculiar, aromatic flavor. In Europe the plant has been cultivated for centuries, and with the French it is—under the name *Estragon*—one of the most favored herbs. The peculiar flavor of the French mustard is derived from this herb. Its young shoots are used for flavoring salads, soups, pickles, and dishes of various kinds, as we use Celery or Parsley leaves. Tarragon vinegar, a very convenient article for flavoring salads, is made by placing the fresh leaves in common vinegar for a few days, and then straining the liquid.

Being perfectly hardy, when once planted Tarragon requires no further care than to keep the ground around it clean and loose. It is propagated by division of the roots, and thrives in any good garden soil.

ROSEMARY.

Rosmarinus officinalis.

There was a time when no garden was without its Rosemary, which is one of the oldest plants found in cultivation. It was formerly used for seasoning various dishes, but now is but rarely employed for this purpose. The most valuable part of the plant are its flowers; from these an essential oil is distilled, which forms an important ingredient of Cologne Water and other perfumeries.

The plant is a low-growing, half-hardy, overgreen bush, a native of Southern Europe. It should be planted in a somewhat sheltered position, and receive light winter protection.

BUSH BEANS.

Under this name are included all the low-growing varieties, termed in different catalogues as Dwarf, Snap, String, or Bush Beans. Bush Beans usually produce the best results when grown in a deep, moderately enriched, light soil. Very rich soil has a tendency to cause them to run to vine, to the manifest injury of the crop. They are very sensitive to cold and wet; it is therefore useless to plant them before the weather has become settled and the ground warm. After the first sowing, sow every ten days until the end of August, in order to obtain a succession, in perfection; but it is well to remember that for the first sowings one should choose the warmest and most sheltered situations he has at his command.

Bush Beans should be sown in drills two inches in depth, the drills being at least two feet apart. Drop the Beans three inches apart, and do not cover them more than two inches deep; keep the ground clean and free from weeds at all times by frequent hoeings, but be very careful to hoe only when the vines are perfectly dry, as dirt, or even dust, scattered on the foliage when wet or damp, will cause them to rust, and thus seriously injure the crop. In hoeing draw a little earth to the roots at each time, but be careful not to hill them up very high.

The Wax or Stringless varieties of Bush Beans are fast becoming universal favorites, and deservedly so, for when pure they are the best of the Bean family, being entirely free from strings, tender, and of a beautiful

waxy color. Nevertheless, Wax Beans are decidedly objected to by some persons on account of retaining their yellow color when cooked; yet, when properly prepared for the table, they are unequalled by any other vegetable. To those who have not grown Wax Beans I would say, give them a trial this season, and I am confident that you will never regret it.

There are many varieties of Bush Beans enumerated in the catalogues of our seedsmen, but for amateurs, a limited number is most suitable, and the following are about the best:

Early Mohawk.—A valuable variety on account of its hardiness, standing a slight frost

TARRAGON.

without sustaining the least injury, and for this reason is extensively planted for the first crop. The vines are of strong, vigorous growth and very productive, and if the young pods are often gathered, will continue a long time in bearing. The pods are long and flat and, if gathered early, are tender and of good quality.

Early Valentine.—One of our most popular and well-known sorts, and one that will be ready for table use in about six weeks from the time of planting. The vines are of vigorous growth, but the pods are smaller in size, and it is not as productive as the Early

ROSEMARY.

Mohawk. The pods are round and fleshy, and when young of very good quality.

Newington Wonder.—A remarkably productive variety, the vines remaining green longer than those of any other sort. The pods, which are produced in clusters or bunches, are small, but when young are crisp and of good quality. The vines are of dwarf or medium growth, and on this account as well as its productiveness, it is highly prized as the best variety for forcing.

Refugee.—A very popular and well-known sort, the vines being of vigorous growth, hardy and productive, and one that is ready

for table use in about seven weeks from the time of planting. Pods thick and fleshy. This variety is considered to be the best for pickling as well as for the later crops.

Royal Dwarf Kidney is one of the best late varieties, and as a shell Bean for winter use it has no superior. The vines are of vigorous growth and remarkably productive. The pods bear some resemblance to the Early Mohawk in shape and size, the Beans when dried being of a pure white and of a kidney shape, from which fact its name is derived.

Black Wax is a great favorite with most persons. The vines are of dwarf but vigorous growth, and are remarkably productive; the round, wax-like, yellowish, transparent pods being thick and fleshy, they may be used as snaps until fully grown, as they are even then perfectly stringless. It is as early as the Early Valentine, being ready for the table in about seven weeks from the time of planting.

Ivory Pod Wax is a variety of recent introduction and one of great merit. The vines are of vigorous growth and remarkably productive. The pods are long, of a transparent white waxy color, and entirely stringless until fully white. As a snap Bean this is superior to all others in tenderness. It is also the very best as a shell Bean for winter use, the Beans being of medium size, oval shape, and of a pure white color.

CHAS. E. PARNELL.

SUMMER RADISHES.

Outside of our large cities and their vicinities this class of Radishes is comparatively little known; yet, to those fond of this piquant relish, they form a valuable link between the early-foreign and the winter varieties. All are larger, somewhat stronger in flavor, and of slower growth than the common kinds, requiring six weeks or more before they become fit for use.

They need rich, mellow; rather sandy soil for their best development, and may be sown in succession at any time from early spring till September. *Yellow Turnip*, *Golden Yellow Turnip-shaped*, and *Olive-shaped Golden Summer* are the varieties most frequently found in cultivation; but none of these have pleased us so much last summer as the new *Yellow Perfection Radish*. Grown alongside of the varieties named above, it was not only of better quality, but retained its crispness longer than the others, without becoming stringy.

All Summer Radishes should be finely sliced and lightly salted for about half an hour before eating them. This will diminish their pungency considerably.

SUMMER TREATMENT OF ASPARAGUS.

Continuing the cutting of the stalks too late in the season is the most frequent cause of Asparagus beds running out. A good rule to go by is to stop cutting as soon as the Strawberries are ripe. Then the rows should be thoroughly cleared of weeds, the ground well forked over, but not so deep as to touch the roots, and a liberal amount of yard manure worked under lightly. Composted fertilizers are best, but it does not matter much what kind is used, if there is only enough of it, for you cannot hurt Asparagus with too much manure.

The Fruit Garden.

SEASONABLE HINTS.

Propagating Raspberries.—Those who have neglected to make a new plantation or to fill out gaps in spring, may, if they have some old Raspberry bushes on their grounds, still make up for the loss of time, and secure a crop of berries next season. The young sprouts which spring up all around old plants may easily be taken up when they are from four to six inches high, and be transplanted to new beds.

A rainy or cloudy day should be selected for this work, and if the ground is not already wet, it should be thoroughly soaked with water all around the young sprouts. If the soil is very light, it should be firmly packed with the foot, so that a good-sized lump may be taken up without crumbling to pieces. Then, with a sharp spade dig up the stockiest young plants so as to have as much soil adhering as can be carried on the spade, move it to the new location, slide the entire lump in the hole previously dug, fill up with fine earth, and water thoroughly. All the leaves, except the three or four upper ones, should be removed, to lessen evaporation. During the first days following, it is well to shade the plants lightly,—a few leafy branches placed around them answer the purpose completely,—and then mulch the ground with stable litter or any coarse material. With proper care, not a plant in fifty need be lost.

The Apple-tree Borer, which, in its perfect state, is a handsome beetle, nearly an inch long, of light brown color with two dull white stripes lengthwise, makes its appearance during the latter part of this month. The female deposits her eggs under the loose bark of young Apple-trees, near the ground. The young larvæ hatch out in about two weeks, and set themselves at once to work to gnaw through the bark into the tree. They require three years to reach full maturity.

When once in the interior of the tree, the only remedy against them is to find the entrance of their burrows,—which may generally be detected by their castings falling outside on the ground in little heaps like sawdust,—and working a stout wire into the channel. But the time for prevention is now, before the beetles have deposited their eggs.

"Among the preventive measures," says Wm. Saunders in his recent work, "alkaline washes or solutions are probably the most efficient, since experiments have demonstrated that they are repulsive to the insect, and that the beetle will not lay her eggs on trees protected by such washes. Soft-soap, reduced to the consistence of a thick paint by the addition of a strong solution of washing-soda in water, is perhaps as good a formula as can be suggested: this, if applied to the bark of the tree, especially about the base or collar, and also extended upward to the crotches, where the main branches have their origin, will cover the whole surface liable to attack, and, if applied during the morning of a warm day, will dry in a few hours, and form a tenacious coating, not easily dissolved by rain. The soap-solution should be applied early in June, and a second time during the early part of July."

FOR IMMEDIATE BEARING.

The editor of *Fruit Notes* takes exception to that part of our Seasonable Hints for April, in which we caution our readers against the fallacy of planting Raspberries for immediate bearing. He quotes:

"Raspberries bear fruit only on canes of the previous year's growth, which in transplanting have to be cut off, if the success of the plant is desired. The young shoots which will spring up from the roots during the season will bear fruit next year, and no power on earth can make them do so sooner."

Upon this the editor comments thus: "We can but wonder if the writer of the above ever tried this latter."

We can assure the editor of *Fruit Notes* that having cultivated from five to ten acres of Raspberries annually for the past twenty years, the writer had some opportunities to try this latter, and as the result of these trials he does not hesitate to state that Raspberries—a few unimportant fall-bearing varieties excepted—do not bear fruit on the same season's shoots.

"If you plant a Red Raspberry bush," continues *Fruit Notes*, "you may, if you wish, leave a cane of the previous year's growth, and if you do so, no power on earth can prevent its immediate bearing of fruit."

Exactly so, but only to the serious detriment of the vitality and vigor of the plant, and it is for this very reason that we told our readers: "If the success of the plant is desired, the old canes have to be cut off."

These facts are so well established that it seems surprising that any one at all familiar with fruit culture should question their correctness; yet, if any one should want additional testimony, we need only refer to the editorial page of this same number of *Fruit Notes*, on which the editor says:

"Remember to cut off all Raspberry and Blackberry stems close to the ground. It is the new growth from the root only that is of value in newly-set plants."

THINNING FRUITS.

Man, as a general rule, is avaricious. In the pursuit of gain he overtaxes his physical powers, and early death is the result. He plants a tree or bush, excites by stimulating manures its fruiting capacity to the highest degree, and in his eagerness for abundant crops causes weakness and an early death.

Nature perpetuates all fruits by the production of seeds. The maturing of these makes the heaviest drain on the vital energies of the plant. Thinning fruits lessens the number of seeds to be ripened by a tree, and therefore increases its vigor. Judicious thinning improves the quantity, quality, and general appearance.

Peaches should not be allowed to be nearer to each other on the tree than four inches; and will then, as a rule, produce more in quantity than when nearer. Grapes, left to themselves, set many bunches of small size, having many green berries, ripening unevenly; remove the greater part, and you will be rewarded. The tendency of the Bartlett Pear is to over-production. Thin severely while the fruit is quite small. Repeat the same operation when the Pear has made about half of its rapid growth toward maturity. Ripen these with care, and the result will be Bartletts in perfection, and a

week or ten days earlier than those picked at the usual time. The lack in size is more than compensated for in quality. Plums, if not attacked by the curculio, must be thinned by hand. Thinning Apples acts beneficially, and has a tendency to promote an annual crop of fruit. Pick part of the crop of Currants from each bush for use while green, and mark the result. Gooseberries, being used generally before ripe, are not as exhausting upon the bushes as other small fruits.

Thinning of fruits is also a great protection against disease of the tree and fruit; it increases the vigor and health of the plant or tree, adding size and color to the fruit, imparting increased flavor, thereby gratifying the palate and pleasing the eye.

The demand for strictly prime fruit is much greater than the supply, and those who produce the best are always sure of obtaining the best prices.

J. B. ROGERS.

RAISING COCOA-NUTS.

There is a fair probability that Cocoa-nuts will, ere long, be counted among the staple crops of the United States. An extensive plantation of Cocoa-nut trees has just been started in Dade county, Florida, by Mr. Ezra A. Osborn, an intelligent and well-informed farmer, of Monmouth county, N. J.

The seed Cocoa-nuts were brought from South America. One hundred thousand trees have been set out on a tract of about one thousand acres, at a cost of nearly \$40,000, and Mr. Osborn proposes to plant several thousand more next winter. It takes about six years for the trees to begin to yield returns, but it is estimated that in ten years the grove will pay ten per cent. on its valuation.

It is said that Cocoa-nuts can be grown in the United States only on a small extent of sea-coast in Southern Florida, so that the prospects for a very extensive Cocoa-nut yield in this country are small. The Cocoa-nut palm abounds in the East Indies, throughout the tropical islands of the Pacific, and also in the West Indies and South America.

The first operation in Cocoa-nut planting is the formation of a nursery, for which purpose the ripe nuts are placed in squares, containing about four hundred each; these are covered an inch deep with sand, and sea-weed or soft mud from the beach, and watered daily till they germinate. The young plants are set out from twenty to thirty feet apart. A full-grown tree will mature about sixty nuts annually, and continues in bearing for many years.

INFLUENCE OF SOIL ON STRAWBERRIES.

Parker Earle, the well-known fruit grower of Illinois, believes that the soil on which Strawberries grow has much to do with their shipping qualities. His experience teaches him that berries grown on poor, sandy soil will hardly endure shipping one hundred miles, while the same variety of berries on stronger, better land possesses great shipping capability. He also calls attention to the fact that purchasers, as a rule, pay more for berries of attractive appearance than for flavor, an illustration of which is the Monneh, of high flavor but poor color, which is rejected for Wilson or Capt. Jack, both sour but well colored.

APRICOTS.

Midway between Cherries and Peaches ripens one of the most delicious and most beautiful fruits in existence — the Apricot. The tree as well as the fruit resembles the Peach in general appearance, but in quality the fruit is superior and more delicate.

The principal obstacles in the culture of this fruit are that the blossoms appear so early as to become often exposed to spring frosts which prove ruinous to the crop; and that the enreulio is so extremely fond of it that it does not leave any for the owner. Yet there is no great difficulty in preventing either. The measures, recommended in our last number, for the protection of Plums will also prove efficacious with Apricots; and to retard the blossoming season it is recommended to plant the trees on the north side of buildings, walls, or shelter-belts. In small gardens they may advantageously be trained in espalier form against houses or trellises, which affords easy means for the protection of the blossoms by throwing matting over them when frosty nights threaten.

The general treatment and pruning of the Apricot is similar to that of the Peach. The shoots should be cut back every season in order to produce new bearing buds.

The *Moorpark*, shown in our illustration, is one of the largest and finest varieties; its skin is yellow with red cheek; flesh, orange, sweet, juicy, and rich, parting readily from the stone; very productive. The best among the many other varieties named in catalogues are: *Breda*, *Early Golden*, *Hemskerker*, *Large Early*, and *Peach*.

LOW LAND FOR ORCHARDS.

Solomon was sure there was no new thing under the sun, but when the Illinois horticulturists announced that low land was best for Apple orchards, not a few people considered it decidedly novel. Yet, when a large number of our best orchardists aver that low land is best, and thus contradict all received opinions upon the subject, the matter is worthy of investigation.

That in many cases orchards on low land have done best, it is useless to deny. But I am sure this is owing to fertility, and not to location. The fact is, that we starve our orchards. I know of orchards which have not received a bushel of manure in fifteen years, and yet their owners wonder why

they do not bear. Land in Apples should be manured more heavily than land in Wheat; but in less than one case in ten is this done. In placing our orchards upon high ground, we have been forced to plant them upon ridges, which are never so fertile as the low ground, because for ages the rains have been carrying fertility from the ridges to the depressions. After the land is brought under cultivation, this process is hastened by the slovenly system of cultivation. As a result, orchards upon high land are in a soil much less fertile than those upon low lands. If the orchardist whose trees are upon the high land will keep it well fertilized, his orchard will do as well, if not better, than that of his neighbor who has planted upon low land. If of equal fertility, high land is better for orchards than low land; but fertile low land is better than sterile high land, and it is this which has led some to suppose that low land is best, unqualified by any conditions of fertility.

it must be because its temperature is more equable, for it is extremes of temperature which destroy a great many of our trees. That the temperature of the air above low land is more equable appears plausible. As low land will be the moister, the exhalations from it will be greater and the more moisture there will be in the air above it. This condition of the air would retard the radiation of heat from the earth, reducing the extremes of temperature of the soil at all seasons, and keeping it warmer at night in winter, when its temperature is likely to sink to a hurtful point. On low land there would always be more surface water, and the freezing of this would protect the trees, for a time at least. But will not this very moisture in low land work more evil than good? Are we to suppose that all the evils attending low, wet land for orchards have

"Folded their tents like the Arabs,
And as silently stolen away"?

Really, I believe that the site has very little to do with the orchard. Insects prey upon trees, no matter what their elevation, and diseases attack them anywhere. Good cultivation, good care, and manure will make an orchard of good varieties profitable upon almost any site; while the lack of these will cause failure, no matter where or how the orchard is situated. What little advantage there is in locality is in favor of high land.
JNO. M. STAHL.

MOORPARK APRICOT.

I know that in every instance my experience with well surface-drained but not under-drained land has proved that high land is best for an Apple orchard. My observation confirms what experience has taught me. It is true that this is a day of new developments and of new theories. But I cannot believe that all natural conditions have so radically changed as to make, other things equal, low land superior to high, being land for Apple orchards.

It is claimed that orchards on low lands are more productive and longer-lived. If they are more productive upon low land, it is clearly because low land contains in a greater degree the elements of tree growth and nourishment; in other words, greater fertility. If longer-lived upon low lands, it must be because the conditions of the soil and atmosphere there are more favorable to longevity.

If the condition of the air favors longevity,

THE FRIENDLY MOLE.

That, in grub-infested ground, the mole is only a blessing in disguise can hardly be doubted; and, although we do not urge our readers who do not already have a supply to stock their gardens with moles, the experience of an Indiana fruit-grower is worthy of consideration:

"Last year I put twelve moles in my Strawberry patch of five acres to catch the grubs, and they did the work. I never had a dozen plants injured during the summer, either by the grubs or moles. I know some people do not care for moles on their farms, but I want them in my Strawberry patch."

A SPECIFIC FOR RASPBERRIES.

If there is such a thing as a specific in horticulture, says J. T. Lovett, ground bone is a specific for Raspberries.

The Flower Garden.

JUNE.

Fair girlhood of the year! in which she weaves
More gaudy colors in her simple dresses,
And knots the waxen Lily's buds and leaves
Among the braidings of her glossy tresses;
In whose enjoyment, all the afternoon,
Like lovers at the shrine where love reposes,
We live enraptured—thou art here, O June,
All fragrant with the odor of thy Roses.

Upon the leafy lute-strings of the trees
The zephyr sings its monody of sweetness,
The feathered warblers hearken to the breeze
And trill the echoes of the song's completeness:
The little brooks, whose waters hum a tune
Unto the overhanging reeds and grasses,
Uplift their notes to bid thee welcome, June,
And nod their Lilies as thy footstep passes.

And when at eventide the jealous night
Bids guarding day her tutelage surrender,
What time the golden stars display their light,
The silver moon her most enchanting splendor,
So loth is day to speak the last good-byes
She tarries while the somber night advances,
And lingers on the threshold ere she flies,
To catch the latest of thy wakeful glances.

Back from the sunny Southland in thy train
Return the bobolinks, the jays, and thrushes,
The bluebirds warble in the fields again.
Kingfishers swing above the river rushes;
The shady groves are eloquent with song.
The flowery meads melodious with hummers,
And music walks beside thee all day long,
And lends its charms to beautify thy slumbers.

— Boston Post.

SEASONABLE HINTS.

Gladiolus.—Comparatively few persons derive from these superb bulbous plants all the enjoyment they are capable of giving. It is a great mistake to plant one's entire stock of bulbs at once, and consequently have them all come into flower at the same time, and at a season when there is an abundance of bloom in every flower garden. The greatest merit of the Gladiolus—although beautiful at any time—consists in its value as an autumn flower.

The bulbs may be planted as soon as the ground becomes fit to be worked, but to insure continuous bloom, successive plantings should be made at intervals of two weeks, up to the beginning of July. Any good, moderately rich garden soil is suitable for their growth. In heavy soils they should be planted three to four inches deep, and in light and sandy ones from four to six inches.

Tigridias.—We could never fully account for the lack of attention to these beautiful summer-flowering bulbs, as they are of the easiest culture and of as brilliant and striking beauty as anything can be imagined. The bulbs are not as hardy as Gladiolus, and should therefore not be planted before all danger of frost is over. They require a rich, light, and deep soil, and should be planted about two inches deep.

The principal very distinct varieties hitherto known were *T. pavonia*, with bright scarlet flowers, spotted with yellow and brown; and *T. conchiflora*, orange-yellow, spotted with brown. To these is now added a white variety, *T. grandiflora alba*, which may justly be considered one of the most valuable recent introductions. Its flowers are larger than those of the older kinds, almost pure white with crimson spots in the center.

The flowers of all the Tigridias last but little more than half a day, but new ones expand daily in great abundance.

ROSES.

The most beautiful flower of the early summer is the garden Roso, and when in full bloom there is none to dispute its title of Queen of the Flowers. The old-fashioned varieties which bloom only in June, such as the Damask, Provenec, Cabbage, Climbing Roses, and Moss Roses, are all hardy, and, if they are well fed, they will never fail to give great satisfaction. But there is much complaint among old gardeners that their Roses do not flourish well. This is owing to two things, or perhaps three.

There is too little sunshine to perfect their beauty—shade-trees and shrubs having overshadowed them—and their peculiar tastes have not been consulted, *i. e.*, the food they require has not been furnished for them in plentiful supplies. Roses will grow upon any soil, to be sure; but, to grow in perfection, the soil must be strong, and highly enriched with well-decayed stable compost, or a suitable commercial fertilizer. The Rose is as gross a feeder as the Pansy, and, if well fed, it will fully repay the care given to it, by its great luxuriance.

Tobacco-stems and refuse tobacco are now considered the best of fertilizers or mulch for a Rose-bed; and they will also aid to destroy the insect pests, which are the third reason for the Rose-blight, of which so much complaint is made. But with air-slacked lime scattered freely over the bushes while wet with the morning dew, the slug can be prevented from skeletonizing the leaves and destroying the buds. Two or three applications will rout an army of slugs, as has been fully proved in many gardens. The white powder detracts somewhat from the beauty of the bushes, but it will soon shake off, and it is more easily applied than any of the washes that are so much extolled. Fly-powder and hellebore will also kill them, and will destroy the Rose-bug; but a vigorous shake of the branches every morning over a basin of hot water is the best antidote for those disgusting crawlers, whose presence will injure all the beauty of both flowers and foliage.

Indeed, "we must fight if we would win" fine Roses, as vigorously as the ancient hymn encourages us to fight to win the highest heavens. But there is nothing worth having in life which can be attained without a struggle, a contest. "Even that a Rose may live, something must die."

Soot is an excellent antidote against all insect pests, while it will also nourish the roots of the plants. So, if you burn wood, sweep down the soot from the chimney-back, and scatter it over the ground directly under the bushes, and see its results.

Remontants, or Hybrid Perpetual Roses, so called because they "rise again,"—*i. e.*, will bloom again in the autumn if *duly cared for*,—are the most popular variety for the open border. But, to make them true to their name, it is well to cut off at least one-half of their buds, and never to permit seed-pods or haws to form. As soon as a flower begins to droop, cut it off and take a long stem with it, and this pruning process will increase the growth of the flowering stems for the autumn. Cut your Roses with an unsparing hand, and they will reward you with more flowers. Cut out all the old wood of Monthly Roses after the June flowering, and encourage stout shoots from the roots, which will bear the largest and finest Roses.

There is much choice in the selection of froo-bloomers among Remontants, but without close pruning and the richest of plant-food you cannot produce fine buds. If the slugs come again in August, put two table-spoonsful of lac sulphur to a gallon of water, and sprinkle it over the leaves, after stirring it well together, and a good dose of barn-yard drainage will not come amiss. It can be applied once a week with great benefit to all Roses. It is not too late to purchase Roses now, especially Tea Roses, which will flower until Christmas if kept in pots of rich compost, made friable by gritty sand, and closely pruned after flowering. Sand is a most desirable addition to the soil of all potted plants.

Without *Moss Roses* no collection of Roses can be complete, as they are indeed the belles of the rose-parterre. The *Cristata*, or Crested Moss Rose, is one of the loveliest of the tribe. It was found many years ago growing in the crevice of a wall at Friburg, in Switzerland, evidently starting from a seed, and it is supposed to be a cross between the old Moss and the Provence Roses, as it has all the characteristics of the Moss, while its full flowers resemble those of the Provence. Its buds are simply perfection, their calyx being divided into a fringe-like crest, clasping and rising above its deep pink petals. For perfect growth a rich, deep soil is needed, and then it will command the admiration of every one.

The monthly, or Remontant Moss Roses, which will flower in the autumn if rightly cared for, should be in every garden of Roses. There are pink and white and crimson varieties, which are all beautiful.

A prominent rosarian of England, who belongs to the clerical persuasion, writes very charmingly upon his favorite flower, and he quotes from a letter of Mr. Sharpe's the following:

"I met Mrs. Siddons at dinner just before the death of her spouse. It was at Sir Walter Scott's, and you cannot imagine how it annoyed me to see Belvidera guzzle boiled beef and mustard, swill portor, take huge pinches of snuff, and laugh till she made the whole room shake."

So did the prima-donna of the stago, and so does the Rose rejoice in strong sustenance, solid and fluid, with occasional pinches of tobacco-powder and *lac sulphuris*; but, as with Mrs. Siddons, they who had dined with her forgot the beef, and the beer, and "the pungent grains of titillating dust," when she appeared in all her power as an artist,—so, when we see the Rose in all her beauty, we forget the midden and the tank. However unsightly to the eye, or unsavory to the nose, they seem to say, like the Earth in the Persian fable:

"I am not the Rose: but cherish me, for we have dwelt together."

When you ask what varieties of Roses shall we grow? the answer must be, "All kinds—single and double, small and large, and in all shapes—bushes, trees, and climbers—for one cannot have too many Roses." But, if you would grow perfect buds and flowers, you must not be too fearful of soiling your fingers, even if it makes them like those of Martin Barney, to whom Charles Lamb said over a rubber of whist:

"Oh, Martin, Martin, if dirt were trumps, what a hand you would hold!"

DAISY EYEBRIGHT.

SALPIGLOSSIS.

Of the large number of beautiful annuals suited for outdoor cultivation, there are none that, when well grown, will produce so striking and attractive an appearance as the different forms of this genus. They are not entirely hardy, and the seed should therefore not be sown in the open ground before the latter part of May or the first of June. As to soil they are not very particular, but they do better on soils that are comparatively light and warm, and ought to be planted where they will not be overshadowed by trees or large shrubs. They do not bloom till late in summer, and must be well thinned out to allow sufficient room for the full expansion of the plants, which, ranging from one to two feet in height, show to best advantage when arranged in clumps of from three to five plants.

A long season of growth is a prime necessity, and those who would have these flowers in their true character and in full bloom for as long a period as possible, must begin earlier in the season, and assist the seedlings during the early stages with a little artificial heat.

There is no better course, says the *Gardener's Magazine*, from which the accompanying illustration is reproduced, than to sow the seed in shallow pans filled with a light, rich mixture, such as would be formed with equal proportions of loam, peat, and leaf-mold. Peat may be dispensed with; in which case loam and leaf-mold should be used in equal quantities. Thin sowing may be strongly advised, as the plants can then be allowed to attain a size suitable for pricking off before they are removed from the pans. For the majorities of gardens, the plants of each variety that can be raised in a twelve or fifteen-inch pan will suffice.

The propagating pit will be the most suitable place for the pans until the seedlings are about half an inch in height; but it is of little consequence where they are placed, provided the temperature is about 70°, and the pans can be placed a short distance of the glass after the seedlings have made their appearance. As a matter of course, the soil must be maintained in a moderately moist state, and the watering be done with a can, to which a fine Rose has been attached, to avoid any displacement of the soil with which the seeds are covered.

Although a rather high temperature has been advised for the first stage, the seedlings should be removed to cooler quarters immediately they are about half an inch in height; the best results being obtained by hardening them somewhat before pricking off. The boxes used for this purpose are prepared in much the same way as the seed-pans. In these the plants are pricked off about two and a half inches apart, and then kept rather close and shaded for a short time, until they are becoming established. They are then gradually hardened off and freely exposed, to promote a stout, compact growth.

When raised in heat, as here advised, the

MIRABILIS, OR FOUR-O'CLOCK.

This is a strong grower, often covering a space three feet square, if given a good soil to spread its roots in. It blooms profusely. Its magenta, violet, white, and striped flowers are quite as attractive as some varieties of *Petunias*, which they considerably resemble in shape. It makes a good summer hedge if the plants are set about two feet apart. It can very easily be raised from seed planted in the open ground in May.

ESCHSCHOLTZIA, OR CALIFORNIA POPPY.

A very showy flower, not a very robust grower, rarely being seen more than a foot in height. Its foliage is finely cut and very pretty, and serves as an excellent background or ground-work on which to show off the bright yellow and orange flowers, which are in shape very much like a small single Poppy. It is a good summer bloomer, and a bed of it is a brilliant sight in July and August.

THE MARIGOLD.

This is another old flower, which, sooner or later, will be "in style" again, I venture to predict. If the Sunflower can be popularized, I see no reason why this flower should not. It is quite as brilliant and can be used with much better effect. Like the Four-o'clock, it makes a good low hedge against which other flowers can be shown off to good advantage, especially scarlet ones. The French varieties are not such strong growers as the Africans, but are better bloomers. The foliage is pretty, being somewhat fern-like, and has a strong pungent odor that is not at all disagreeable. The striped varieties, yellow and brown, are velvety in the intensity of their color, and are really beautiful flowers. The large double ones are not as

desirable as the small single ones. These flowers are very effective in large beds when used with scarlet *Geraniums*. They can also be made effective when grown with white *Phlox*.
R. E. E.

ROUGH ON FLOWERS.

A correspondent from Washington County, Utah, writes: "Our winters are so severe and long that but few flowers can be grown here. We are not free from frosts until near the middle of June, and they return again the end of August. What little summer we have is very hot, and nothing can be grown without watering."

SOME SHOWY FLOWERS.

As a general thing, our more delicate flowers—the kinds we would select for a bouquet, or for use in vases and on the table—are not so well adapted for use in large beds in the garden, or on the lawn, where a color-effect is aimed at rather than individual beauty, as some of the following rather coarser flowers:

SALPIGLOSSIS.

The Window Garden AND GREENHOUSE.

THE PRIZE FLOWER.

[The prize for window-gardening was won, some time ago, by a poor man living in an attic where the sun shone but a few minutes every day, when he would hold his flower up and turn it round while the sunshine lasted.]

It was high noon; and through the dusty streets
A worn, stooped form among the busy throng
Wended his way. A little flower he bore
Within his arm, and when he reached the place
Where they had bid him come, he laid it down
Amongst the rest; he standing near to wait.
Flowers of the richest hues, sweet-scented ones,
And those of dazzling splendor, were there, too.
His eye scarce moved to them, whatever they
were;

Shy, silent, and unnoticed, he stood
As guardian of his own bright, peerless one;
For it had been the sweetest thing to him
In his lone life, and as it grew he watched
The velvet petals opening from the buds,
As a mother would the features of her child.
Its sweet, delicious fragrance was to him
As grateful love; it was a thing divine,
So exquisitely wrought! and when he felt
Oppressed by anxious care, 'twould softly breathe
Sweet words from Holy Writ — "And shall He not
Clothe you much more?" and soothed his heart
to rest.

At length his name was called, but he remained
Absorb'd in thought, and heaven had those
thoughts;

And when one came and said to him, "Your
flower
Has gained the prize," he knew not what was
said;

But when he knew, his eye grew bright; tears
coursed

The aged cheeks for very joy of heart.
And there was pride, not for himself, nor all
His care; but such we feel when noble things
Are done by those we love!

—London Golden Hours.

WATERING PLANTS IN POTS.

Some people attempt to keep pot plants without giving them any water at all; the result is familiar to every one. Usually, however, the earth in the pot or box is kept soaked, and very much in the condition of an ordinary swamp. We have ourselves seen dead evergreens pulled out of boxes full of mud. *Neuste Erfindungen* gives utterance to the following timely remarks:

"Watering plants is one of the most important things in the culture of house-plants, and very special care should be devoted to it. Plants ought not to be watered until they need it. It will be evident that they require wetting if, on taking the earth from the pot it crumbles to pieces like dust; a sure sign is to knock on the side of the pot, near the middle, with the finger-knuckle. If it gives forth a hollow ring, the plant needs water; if there is a dull sound, there is still moisture enough to sustain the plant. Plants must not be wet more than once or twice a day; on dry, clear days they require more water than on damp, cloudy days. On the other hand, the earth must not be allowed to dry out entirely, for that is also very injurious.

"In wetting them, the water must be poured on in such a way that it will run out again through the hole in the bottom of the pot. If the earth gets too dry, it is best to place the pot in water, so that the water will saturate the soil very gradually."

BASKET PLANTS.

OXALIS.

If I were obliged to confine myself to one plant for a hanging-basket, that plant would be the Oxalis. It has pretty foliage, which is produced in great profusion. The leaves are borne on long and slender stems which droop over the basket gracefully and almost hide it. The flowers are borne well above the foliage and are charming little things. I like the pink-flowered variety best. It blooms more profusely than any other variety I have ever grown. This plant requires very little care. Give it a good soil to grow in,

OXALIS BASKET.

and plenty of water, and it will be sure to please you. It does not insist on having sunlight, but it will do better with some than it will without any, being brighter in color, and flowering more freely. The only insect that I have ever found on my Oxalis is the red spider, and a daily use of the syringe for a week has ronted him.

TRADESCANTIA.

The variegated Tradescantia is a very pretty hanging-plant. I have a basket of it in which the variegation is very unique.

TRADESCANTIA MULTICOLOR.

Some branches are entirely white; others will have a few green leaves, while some have nothing but striped leaves. If any green branches appear, I cut them off at once. This plant will grow well in a soil so poor that other plants would starve to death in it, if you will give it plenty of water. I do not like it as well when grown in rich soil; the joints between the leaves are longer, and the growth is too rampant. To make it throw out a large number of branches, pinch the ends off close to the pot. Keep at this persistently until the surface of

the soil is covered with young shoots, then let them grow. It does not seem to care at all for direct sunlight.

MADEIRA VINE.

For large baskets I have found the Madeira Vine very satisfactory. I do not give it a rich soil, and in consequence its growth is not so strong; but the leaves will be closer together and more attractive than when it has a rich soil to grow in. I pinch it back pitilessly until the basket is covered with foliage. After that I let a few vines grow, allowing some to droop, and others I train up along the chains suspending the basket. Keep the glossy leaves clean and you will have a charming plant by treating it in this way.

E. E. REXFORD.

SOIL FOR POT PLANTS.

One reads so much in certain periodicals about the importance of having this or that kind of soil for different plants, that the amateur is quite sure to get the idea that to grow plants well requires skill in selecting the proper soil for them to grow in. I used to think so, and often went to a good deal of trouble to secure such a soil as was recommended for a particular plant. But one day I received some new plants, and as I had none of the soil recommended as necessary for them, and could not secure any, I potted them in the same compost used for Geraniums, and other plants of that character—a mixture of turfy loam, garden mold, well-rotted manure, and sharp sand, in the proportion of one-third of loam, one-third garden soil, and the other third made up of the manure and sand. For strong-rooted plants I add less sand than for those having many small roots. In all cases I had sand enough to keep the soil from becoming heavy. The result was that these plants made as fine and healthy a growth as I cared to see. I began to think then that perhaps it was not necessary to go to so much trouble in procuring different soils for different plants as I had supposed, and after experience convinced me that most plants will do well in almost any good soil. It is astonishing how readily plants accommodate themselves to circumstances widely different from those in their natural state.

Some plants, like the Fuchsia, prefer leaf-mold, and will do better in it than in anything else I have ever tried; but I grow fine plants in exactly the same soil that I give my Geraniums. It is my practice to mix the turfy loam—which I procure from under old sods in the pasture—the garden mold and the manure—which I get in corners of the barn-yard—well together, and add the sand as I pot my plants, putting in more or less as I consider it advisable.

I find that most amateurs do not seem to consider it necessary to pay much attention to the item of sand. But it is. I would sooner omit the manure, if I had to choose between the two. If you use plenty of sand the soil will never become heavy and compact, and quite likely sour. The sand keeps it light and porous, and the water runs out readily, thus making it almost impossible to drown out the plant by over-watering, and the air can penetrate to the roots easily. Make up such a compost as I use and you can grow good plants in it every time.

GESNERACEOUS PLANTS.

ACHIMENES.

A beautiful genus of plants, the various species of which are natives of Central America and Jamaica. Many varieties are now in cultivation, all beautiful, exhibiting a great variety of colors—crimson, scarlet, white, pink, and orange, and the different shades arising from a combination of these. The flowers are produced from the axils of the leaves in great abundance.

They are propagated by cuttings and by the scaly underground tubers with which they are furnished. Early in spring, place

ACHIMENES.

the small tubers in pans or pots, provided with good drainage and light, rich soil, composed mostly of leaf-mold and sand. Cover slightly with similar material, and place where they can get a good bottom-heat. When well started, and the shoots have grown about two inches high, transplant about three inches apart in other pans, pots, or baskets. A basket made of wire in a globular form, lined with moss and filled with soil, recommended above, mixed with a liberal addition of thoroughly rotten manure, in which the young plants are placed all around, using the different colors, is one of the prettiest objects one could imagine. It will soon become a complete mass of flowers, lasting during the summer and autumn months.

Better success is generally obtained by transplanting the plants than by shifting into larger pots or pans. Pans about five inches in depth are more suitable for the growth of this class of plants than pots. If the latter are used, fill them about half full with potsherds for drainage. Unless the water is allowed to pass freely from the roots, the leaves are liable to rust, which affection arises often, also, from syringing overhead too often. When the plants are making their most luxuriant growth, keep well supplied with water at the roots, and with a warm, moist atmosphere, but do not syringe overhead. They require to be shaded from the strong rays of the sun, and it is principally from neglecting to give sufficient shade that many persons fail to grow Achimenes successfully.

When the plants commence flowering, remove to a cooler place, but do not allow strong draughts to rush against the plants, as they are very impatient in such a position. After the season of blooming, gradually withhold water until the tops are completely decayed, then place the pots containing the tubers in some place where they shall be free from all water, and have a moderate temperature until ready for

starting in the spring. The tubers keep better in the pots in which they were growing during summer than if taken out and placed in sand or any other material.

There are a great many varieties of Achimenes, the result of crossings of *A. coccinea*, producing small scarlet flowers, with *A. longiflora* having large flowers. The strongest and most easily cultivated kinds are those nearest the *longiflora* type.

GESNERA.

In the beauty of their flowers, not less than in their singularly marked, soft, velvety foliage, are the different varieties of Gesnera valuable. If treated properly, they may be had in flower during the winter months; in fact, with a fair supply of plants, their beauty may be enjoyed during the entire season by starting them into growth at different periods. Soil similar to what is recommended for Achimenes is suitable for them. Plenty of water at the roots during the time of their vigorous growth is indispensable. They must not, however, be syringed, as this destroys the foliage. The plants, in order to produce good results afterwards, must be well cared for after flowering, as on the proper maturing of the tubers depends their future success. They are propagated by division of the tubers and by cuttings.

to be handled, transplant into pans about an inch apart each way, keep them in a moist, hot atmosphere, where they shall grow rapidly. When the plants have grown sufficiently large to touch each other, pot into small pots, using as soil good fibrous loam, leaf-mold, and thoroughly rotted manure, with plenty of sand to give porosity to the compost, as they require it shifted into larger pots, until they show signs of flowering. When in flower, keep in a rather cool house, as in a cool temperature flowers keep much longer in perfection, especially if they are kept perfectly dry. Moisture on leaves and flowers is apt to destroy them. Keep

GESNERA.

perfectly dry when at rest, and in a cool house.

Propagation can also be effected by the leaves. Either insert the end of the petiole in sand where a brisk heat can be maintained, or lay the leaf flat on the sand and cut the mid-rib through just below the junction of the veins with the rib; by this means a plant can be produced at every cut. Pot when large enough, and treat as directed for seedlings. There are varieties with drooping flowers, with erect, and some with semi-double. Any and all kinds may be produced from a package of good seed.

M. MILTON.

ECHEVERIA METALLICA.

The easiest way of propagating these beautiful plants is from seed, which should be sown either in warmth during early spring, or after that time in a cool house or frame. The seeds are extremely fine, like dust, indeed, and the only way to get them up is to fill the pot with fine soil to within a quarter of an inch of the rim, make the surface firm, but not hard, and very level, watering sufficiently to moisten it through; then coat it with dry silver sand; sow the seeds thereon and press them in gently, which will cover them sufficiently; place the pot where it cannot dry out quickly, and be careful never to allow the surface to become in the least dry. When the young plants appear, move them to the full light, and when large enough to handle prick them out in six-inch pots or pans.

Grow during the summer in a light, airy greenhouse, potting singly into small pots when large enough, using sandy loam and giving good drainage. In the course of a couple of years they will come into six-inch pots, and in these they may remain for two or three years, as they bloom best when root-bound. Well grown, they flower freely in winter and early spring, and are very ornamental. A cool greenhouse in winter suits them best.—*Gardening Illustrated.*

GLOXINIA.

A house filled with the different kinds of Gloxinia is a sight to be remembered. Their finely marked, campanulate-shaped flowers arising above the strong, sturdy foliage.

GLOXINIA.

make them beautiful objects for any position. By potting at different periods, a succession of flowers can be had the entire season.

Good varieties may be secured from seed, if collected from a good strain. Sow the seeds on finely sifted soil, be careful in watering, and, instead of covering with soil, cover the pan or pot with a piece of glass until vegetation begins, and at all times, until the plantlets set good roots, do not allow them to get dry, or allow the sun to shine on them, as they are very easily destroyed with such treatment.

As soon as the seedlings are large enough

Lawn and Landscape.

LANDSCAPE GARDENING.

Owners who build in new places, which are destitute of trees, often feel disposed to cover the baldness by planting thickly over the whole surface. In this way two mistakes are committed.

Handsome landscape planting consists in leaving at least a portion of the grounds as open lawn, so that there may be an agreeable distribution of trees and open space, and thus the eye may have a wider range. The thick planting grows tall, the trees are crowded and drawn up without side limbs. The owner often lacks the nerve to thin them out in time, or some of his family dread to see their favorites, as they regard all the trees, remorselessly sacrificed. It is therefore well, in setting out ornamentals, to bear in mind how large they will become, and how far their branches will extend, if allowed free scope, in future years. If a greater number is indispensable, plant smaller kinds.

Among these smaller ones may be named the different varieties of the Horse-chestnut, the Mountain Ash, the Judas tree, Sweet Gum, Hawthorn, Virgilia, *Acer campestre*, and *Magnolia tripetala* and *Soulangiana*. Among the smaller evergreen trees are White Spruce, Cembrian Pine, Red Cedar, and Siberian Arbor Vite. The larger shrubs may come in near the boundaries of the larger plantings, or next the open lawn, and these may include the Tartarian Honey-suckle, the Philadelphus, the larger Lilacs, the Purple Fringe, and the Purple Barberry.

Hardy climbers may be moderately introduced in the more remote or secluded portions of the grounds, such, for example, as the Virginia Creeper, the Trumpet Creeper, the Aristolochia, the Akebia, and the common White Clematis. But stiff wooden structures to support them should be entirely excluded. A festoon or two on an old tree would be more pleasing.

Much labor is often needlessly expended in heavy grading, in the attempt to reduce the surface to an exact plain. If naturally uneven, all that is necessary is to round off the sharp angles, partly filling abrupt depressions. The curved surface thus obtained, if judiciously managed, will be made more pleasing than a dead level. The ground must be smooth enough for the lawn-mower, — the great leading implement for beautifying home grounds.

Farmers may object to these improvements on account of the expense. But those who regard as a matter of importance making their homes pleasant and comfortable to their families, and attractive to young persons who are growing up, and who are about to choose between a wholesome and useful country life on the one hand, and one either of a roving character or with the uncertainty of the city on the other, ought not to hesitate in devoting some attention to pleasing surroundings of their dwellings. The expense may be varied indefinitely at the option of the owner. If he has a mortgage on his farm which he is endeavoring to reduce, he may still secure much that is desirable with very little outlay.

A half acre or more may be spared from his hundred-acre farm without any great

loss, and he may plant it with a few dollars cost and labor. He may run the hand lawn-mower over it once a week until the end of summer, or thirteen times at a cost of less than five dollars. The foot-walks should be few, that they may be more easily kept in order, and the entire expense of keeping them neatly trimmed need not be more than one dollar. Only six dollars a season after the grounds are planted, ought to satisfy the most parsimonious, for the good it would do.

With a little more liberality, a few circular or elliptical flower-beds might be cut in the smooth turf, and give great additional beauty to the place. The man who is in debt, or who has very small means, should be willing to do as much as this, many of whom are spending a great deal on worse than useless Tobacco, and who might find various means for useful retrenchment by reading Dr. Franklin's "Poor Richard."

These remarks are intended, however, for those who can well afford to make liberal provision for pleasant surroundings for their dwellings, with shrubbery and flowers near the house, and handsome shade trees on the more remote portions of the ground; and who, if ample provision is made besides for such fruit as Strawberries, Raspberries, and the summer ripening varieties of Peaches, Apricots, and Pears, will find little difficulty in affording home attractions to their growing-up boys, and drawing them from a roving and profitless life.

Those who have large farms and plenty of land to spare, and especially those who occupy the broad plains of the West, may give their home grounds a park-like appearance by devoting several acres to planting shade trees, and grass may be kept short by the grazing of sheep. Let the trees be planted far enough apart for full development of their rich forms, and when they are full-grown, such trees as the Oak, Chestnut, Black Walnut, Elm, Maple, and many others, properly grouped and distributed, with broad sweeps of open lawn, will impart richness and magnificence to the landscape, and all will remain year after year with little or no attention. Where there is some natural growth of these trees already on the farm, enough may be carefully retained to impart this fine result at once without waiting for the trees to grow. — J. J. Thomas, before the Western N. Y. Horticultural Society.

MENDING HEDGES.

One of the most annoying sights in a lawn or garden is a defective hedge. When only single trees or bushes are missing, the branches of the adjoining ones may generally be trained so as to fill out the gaps, but when several successive ones are wanting, their places have to be filled with new plants. The difficulty which presents itself in this case is that the roots of the adjoining and well established plants take so much moisture and nutriment from the soil in which the young plants are placed that they can make but a puny and sickly growth, and generally die in the course of a year or so.

To insure success a trench must be dug the entire length of the gap. This should be three feet wide and as deep as the roots of the hedge run; all roots that come in the way have to be cut off clean, and removed. The trench should then be filled with fresh, rich soil, in which the young trees are to be

planted, and if the work is done carefully, a good mulch applied during summer, and a liberal coat of manure next fall, the plants will grow readily and soon fill out the gaps.

HARDY RHODODENDRONS.

"Are there any really hardy Rhododendrons?" is an inquiry on hand. As was stated in a former number of THE AMERICAN GARDEN, none are as hardy as a White Oak, yet with but very little attention to their natural habits and requirements some of the most beautiful kinds may be grown out doors to perfection.

The best hardy varieties we are acquainted with are: *album elegans*, very large white; *delicatissimum*, white and bluish; *Everestianum*, rosy lilac; *Lee's Purple*, very large dark purple; and *roseum elegans*, delicate rose. These will give as much variety of color as is possible in a small collection, and will, with fair attention, thrive anywhere. Where these fail it is useless to try others.

In making an additional list of about a dozen varieties no two growers would probably agree entirely. From a comparison of some of the best collections in the vicinity of New-York, Philadelphia, and Boston, our choice would be: *Alexander Dancer*, *atrosanguineum*, *blandum*, *Blandyanum*, *Charles Dickens*, *Gen. Grant*, *giganteum*, *gloriosum*, *grandiflorum*, *H. W. Sargent*, *Mrs. Milner*, *purpureum elegans*.

PLANTING FORESTS.

It is a matter of common observation that whenever any tree grows in an isolated position in the open field it will form a very short trunk and a large spreading top, and that while trees grown for their fruit yield the best returns when of this character, quite the reverse is true when the object of its production is timber. By observation of natural forests, and from the experience of planters in Europe and elsewhere, we learn that the best timber results are produced by planting the trees closely enough at the start, so that after a year or two of cultivation a constant shading of the surface will be maintained during the growing season, and at the same time each individual tree will have enough room to make a healthy growth, thinning out by removing alternate trees from time to time, as more space is required.

— Forest Leaves.

BOX EDGINGS.

If there is any old Box on the place, the clumps may be dug up and torn in even-sized pieces so that some roots remain to each piece, otherwise it may be obtained from any nurseryman. A ditch is dug along the walk where the edging is wanted, and the slips are placed along the straight edge so that about an inch of the top remains above the ground. Fine soil is then drawn into the ditch, firmly pressed down with the foot, and all leveled. If the weather is very dry the plants should be watered evenings and a light mulch applied during summer. The earlier in spring it is planted the better are the chances for success. To preserve its freshness and uniform shape it has to be shrouded every spring, taking care never to cut below last year's growth.

Rural Life.

BIRD HOMES.

Blue-birds, martens, wrens, and the European sparrow, will all occupy houses built for them, seeming to prefer to be near our homes and to court our protection.

When traveling along our Eastern coast line, from New York to Maine, says A. W. Roberts, in the *Young Scientist*, I found the European sparrow everywhere, even at Grand Menan; and I was much amused at the many rude and conical styles of bird-houses in use. Milk cans, butter firkins, old straw hats, and discarded bee-hives were utilized for this purpose, and in one case a farmer had scooped out several hook-necked squash and club gourds which he had fastened under the eaves of his barn, for some wrens, who had taken possession of them.

The prevailing school of bird-house architecture is very primitive and very ugly. And, as if to add to their ugliness, they were often painted of either a dead white, ultramarine blue, bright green, or yellow, and occasionally bright red, and even black.

None of our native birds would be guilty of ever taking up quarters in a vermilion colored house, but those feathered tramps and loafers, the sparrows, ever ready to crawl into any hole or place to secure a footing, in this instance seemed color blind or indifferent, so long as they obtained a roof to shelter them.

In painting bird-houses, never use bright or glaring colors or gilding, as it is not only in bad taste and not in harmony with nature, but to birds of modest and retiring habits is very displeasing. Imagine a pair of our plaintive-voiced blue-birds dwelling in a bright yellow house! think of their rich blue against a vulgar yellow! Could any combination of colors be more inharmonious and displeasing to an educated eye?

All that birds require is a quiet and secure situation for their homes. My father some years ago fastened a number of flower-pots against the side of a brick house. The holes at the bottom of the pots were made large enough for wrens, and too small for blue-birds. As a battle had been raging for a number of days between the wrens and a pair of blue-birds over the possession of the only bird-house on the grounds, the flower-pots pleased the wrens, who took immediate possession, and ceased their warfare on their neighbors.

I have since used flower-pots extensively in constructing bird-houses, and will try to give the readers my experience as a bird-house builder.

The simplest plan is to fasten a seven-inch pot against a stone wall; a hole is cut out of the bottom of the pot large enough to admit of either wrens or sparrows. For cutting the hole, use the large blade of a jack-knife, well notched, and soften the ware thoroughly with water. This reduces friction, and prevents clogging, or drawing the temper of the blade. The hole, after it is cut, can be filed to any desired shape. The pot is held against the wall where it is to be fastened by leaning a post or board against it.

For a cement for fastening, plaster of Paris is to be preferred to Portland cement for light work, and also for its quick setting

qualities, which may be hastened by adding a little salt. The plaster should be applied rapidly about the rim of the pot, and against the wall, till a perfect union is formed. The pot and the wall must be first dampened with water, or the plaster will not adhere.

After the plaster has set, the board prop is withdrawn, and work on another pot begun. When all the pots are fastened in position, the plaster is given twenty-four hours to dry and harden before putting on the rough coating, as the weight of this coating might break away the pots. The rough coating is applied with a broad-bladed table-knife, or "pointing" trowel. Load the trowel with plaster, with the left hand urging the flow of the plaster from the point of the trowel with a stick, the point of which has been well greased or soaked in oil, to prevent the plaster adhering and forming a knob.

When it is desired to make the bird-houses look more picturesque, pieces of lichens and wood mosses may be fastened on with plaster; small branches of vines may also be brought down and around the pot, and for a perch or rest in front of the entrance, a dead twig or branch may be used. These are also fastened to the pot with plaster.

After the plaster is perfectly dry, it should get a heavy coat of boiled linseed oil, mixed with a dull green, brown, or neutral tint. The oil protects the plaster from the action of rain and the atmosphere.

A hanging bird-house may be constructed of a nine-inch flower-pot and an old milk-pan. A hole is made in the bottom of the pot and pan large enough for a turned picket or stick to pass through, and to allow for the fastening of the straw which is to form the thatched roof. A hole is bored through the picket into which a cross-pin of wood or iron is inserted, on which the bottom of the pan rests, otherwise it and the pot would slip off.

The milk-pan is punched full of holes to allow the plaster to pass through and cling, as it will not adhere to the smooth surface of the tin. In applying the plaster to the pot, an extra quantity is used on the inner bottom of the pan, to more firmly unite the pot and pan together. After the plaster has hardened, the rough coating is applied as before described. The pan, after it is filled with earth, is planted with *Tradescantia*, German Ivy, or Madeira Vines, which will cling and twine to the brush cat-screen. Some of the more hardy succulent plants, such as House Leeks, Creeping Charley, *Semper-vivum*, etc. may also be used.

The cat-screen is made of the branches of black alder firmly bound to the picket, some two feet below the bottom of the pan, against which they press and radiate out, forming an effectual obstruction to cats, as well as looking very ornamental when the vines are growing among the mass of branches, buds, and burrs. The best and most ornamental woods for making these screens are Red Birch (with the cones on), Spruce with its rich buds, and Sweet Gum Tree, all very pliable, and easy to handle.

Where a number of pots and pans are to be fastened together, great care must be taken to firmly unite the parts together with a bountiful quantity of plaster, laid on thick. Much taste and skill can be displayed in the different designs formed on the pots with the plaster, but care must be taken to have them in good taste and in keeping with the surroundings.

THE COUNTRY PIAZZA.

The piazza, veranda, or porch of a house can scarcely be called an "interior"; but to the country-house it is really an outdoor parlor in warm weather, and should be made as attractive as possible. It is sometimes so cramped in its proportions as to offer little opportunity for decorative improvements—but, with a reasonable amount of space, it can be made a very delightful adjunct to the country sitting-room.

If large enough to admit such a piece of furniture, a settee, or rattan lounge will be found a most convenient addition, and a thin, flat cushion will be an improvement both in looks and in comfort. Scarlet is the most effective color for this, as contrasting well with the masses of green outside. Scarlet painted chairs have been in vogue for rural piazzas for some years past, and although a superabundance of the color is rather dazzling, it is toned down by the background of green.

Another pretty device for piazza furnishing is to make three or more large pillows of very broad-striped bed-ticking, and cover the blue stripes alternately with scarlet and green braid. This gives a Moorish or Algerian appearance to the cushions, which are to be piled in a corner, and in front of them may be spread a cheap Persian or Turkey mat—or one made of the same inexpensive materials with varied coloring, substantially lined, and edged with worsted fringe.

A rustic table at one end of the piazza to hold newspapers and magazines, the writing portfolio, or the basket of ewels, looks cozy and sociable. A bird-house fastened to one of the pillows and draped with light vines, is really ornamental, and the winged residents, with restless flashings in and out, and their funny little airs of importance, form an endless subject of interest to the invalid whose sole view of outside things must be taken from the piazza.

It sometimes happens that one end of this roofed balcony is exposed to a hopeless glare; no friendly tree stretches forth protecting boughs across it, no vine weaves a web of tender green from end to end; the vegetable world, for some occult reason, avoids it. An awning is the usual resource in such a case, but the striped hood forms only a partial screen. A more effective one is formed by making a net-work of heavy twine, or wire, with a square or diamond-shaped opening left to form a window; at the base of the net-work plant Cypress and Madeira vines, and you will have a shade pleasing and refreshing to the eye, covered with verdure and bloom, and one that will admit of the air freely passing through it.

Hardy vines upon all sides of the country piazza are taken for granted; but the selection should be made with care. For steady wearing qualities, after it has once decided to live and grow—and it is somewhat slow in coming to this decision—nothing is more satisfactory than the Japanese Ivy. The summer foliage is of a rich, tender green, and the young leaf-sprays are very fine and beautiful; while it has additional recommendation of varied autumn coloring. The Evergreen Honeysuckle is another desirable vine for the piazza, while the large, blue *Clematis Jackmanni* is very ornamental. The three combined will make a delightful leafy bower.—*Ella Rodman Church, in Godsey's Lady's Book.*

Foreign Gardening.

LAND CULTURE IN GUATEMALA.

In clearing a Guatemalan forest the trees are felled in January, February, and March, and during April and May the fallen timber is burned, only the huge logs and stumps being left for the ants to remove. The field is then tolerably clear and ready for planting, which should be done before the rainy season begins, in June.

The crops best adapted for cultivation are in a measure indicated by the existence of wild specimens. Thus the Cacao, which abounds wild, is a most valuable crop. Rows of Bananas or Plantains are set out, fourteen or fifteen feet apart, to protect the young Cacao-trees until the Erythras, or "Madre Cacao," are sufficiently grown, for the Cacao is impatient of the direct sun. Plants are raised from seed and begin to flower at three years, but do not bear a good crop until five years. There are two crops yearly—one in December and January, and a larger one in May and June. The tree endures about forty years, and each yields about a pound and a half.

Pine-apples grow wild wherever there is a clearing, and the quality is far better than any we find in our markets. When cultivated, the field is cleaned five or six times a year, and the crop is ready sixteen or eighteen months after planting, and may be computed at four thousand fruits per acre. No replanting is necessary, and it is only needed to thin out the plants yearly.

The beautiful and interesting Nutmeg-tree grows about thirty feet high, and is very long-lived. The climate and soil are very suitable for it. It begins to bear at the seventh year, and by the ninth the yield may be five thousand fruits, besides seventy-five pounds of Mace.

The Cocoa-nut is, perhaps, one of the most profitable ventures, as after the first two years no care is required. At five years they begin to bear, and two years later the crop in these favored lands should average two hundred nuts to a tree.

Bananas are cultivated in all the bottom lands, and are exceedingly profitable. Great mistakes have been made in its cultivation, especially in not giving the plants room enough, for, if crowded or shaded, the bunches, which may weigh ninety pounds, dwindle to twenty-five, and are no longer marketable. The Plantains are much larger, often fifteen to twenty inches long, of firmer substance, and are generally eaten cooked, and it is a matter of surprise and regret that we do not find this most excellent vegetable in our markets.

Maize produces three crops in a year, and grows so tall that the essayist could not reach the ears (three to a stalk) on horseback, and had to fell this Corn-tree to get them.

The most important crops are Coffee and Sugar-cane; but Oranges, Lemons, Limes, Citrons, Pompeloes, Shaddockes, Figs, Rose Apples, Cherimolias, Mammees, Alligator Pears, Sapotas, Granadillas, Bread-fruits, Tamarinds, Papayas, and hosts of other fine fruits, whose very names are strange to us, all grow luxuriantly.

Most of the Coffee for which Guatemala is

so justly celebrated is grown in the department of Alta Verapaz, in the vicinity of Coban, and on the Pacific side of the high table-lands of the interior; but it has been found that the Liberian Coffee flourishes on the Atlantic forest belt, and will probably do better than the Arabian. The trees require shade, especially when young, and Bananas are usually planted with them. The labor of picking, the care needed in drying, and the mechanical processes of hulling, render this a more difficult crop to harvest than any hitherto mentioned, and where the soil is not deep it is soon exhausted by Coffee; but it is a very profitable crop, notwithstanding.

These rich lands are most admirably adapted to Sugar-raising. In Louisiana this is profitable, thanks to the tariff protection, but it is evidently a forcing of Nature. The planter there has great difficulty in preserving his seed-cane through the winter, and must grind his crop before frost.

Hence he has to have an immense mill in proportion to his acreage, and must grind his entire crop in ten days or a fortnight, while his expensive mill is idle all the rest of the year, and the crop seldom exceeds a ton to the acre of the poorest quality of Sugar.

In Guatemala the land is not even plowed for Sugar, but a hoe scratches the furrows, into which the seed-cane is laid, and a few strokes of the hoe cover it. Then begins the fight with weeds; as the planting is done in May, before the June rains come on, the first weeding will be needed in June, and by the end of July the young cane will be high enough to get ahead of the weeds. Twice at least thereafter the process of thrashing goes on. This consists in passing down the rows and breaking off the dead lower leaves and trampling them under foot, which makes an excellent mulehng. In January the cutting begins, and as there is no frost it may last three months, if necessary, and the yield averages four tons to the acre of the best refinery Sugar. But the most remarkable contrast to Louisiana Sugar-raising is that, while there the laborious planting must be done every year, in the bottom lands of Guatemala crops have been cut sixteen years without replanting, with no perceptible diminution in the yield.—W. T. Brigham, before the Mass. Horticultural Society.

BERMUDA GARDENS.

In this sub-tropical island, where the mean temperature for the coldest months is 52°—the coldest point reached last winter being 57°, and the highest 76°—I begin planting my garden about September 20; planting Potatoes, Turnips, Cabbage, Carrots, Beets, Beans, Peas, Lettuce, Tomatoes, Onions, Spinach, Cauliflower, Celery, Parsnips, and all those vegetables which will flourish at a temperature below 76°. I plant every two weeks from September to March the Potato, Bean, and Beet, thus growing a succession of fresh new vegetables for my table from November 15 on through nearly all the twelvemonth. My Strawberries begin fruiting in January, and keep it up until April; and insectious ones they are, too.

In February I begin planting Cucumbers, Melons, Squash, Sweet Corn, Egg-plant, and all the vegetables needing greater heat than is assured us in the early winter months,

and continue to plant every two weeks to April 15. After this date it is of little use to plant anything but Sweet Potatoes; not because the weather is too hot—85° being the highest point ever reached—but they simply won't grow. For ten months of the year I am assured a nice variety of vegetables, and for the two other months I have Sweet Potatoes and Egg-plant, so I manage to survive. The ground of my garden is really occupied with a crop for the whole year. Of course this is very trying to the soil; but I fertilize highly with stable manure, artificial fertilizer, and sea-weed. Almost every vegetable raised in the temperate zone will flourish here, though some utterly refuse to grow.

The farmer of Bermuda devotes almost his entire energies to the raising of Potatoes, Onions, and Tomatoes, though many now are trying other crops. Several are trying Strawberries, others Grapes, both Northern and exotic; others Beans, Peas, Egg-plant, and Cauliflower. One farmer has been experimenting in raising extensively the Bermuda Easter Lily, a beautiful white Lily which flourishes here to a wonderful degree. His fields of two hundred thousand bulbs, white with blossoms, is a rare sight to behold. If these blossoms could only be put down on Broadway, on a February day, his fortune would be assured; but, unfortunately, he cannot, and he makes his money by selling the bulbs to the American and European florists, who force these bulbs in green-houses and put the blossom on your market in the winter months at large prices.—Russell Hastings, in N. Y. Tribune.

COCOA-NUTS IN INDIA.

Curiously enough, at a little distance from the sandy levels or alluvial flats of the seashore, the sea-loving Cocoa-nut will not bring its nuts to perfection. It will grow, indeed, but it will not thrive or fruit in due season. On the coast-line of Southern India immense groves of Cocoa-nuts fringe the shore for miles and miles together; and in some parts, as in Travancore, they form the chief agricultural staple of the whole country. "The state has hence facetiously been called Cocoonut-core," says its historian; which charmingly illustrates the true Anglo-Indian notion of what constitutes facetiousness, and ought to strike the last nail into the coffin of a competitive examination system.

A good tree, in full-bearing, should produce one hundred and twenty Cocoa-nuts in a season; so that a very small grove is quite sufficient to maintain a respectable family in decency and comfort. Ah, what a mistake the English climate made when it left off its primitive warmth of the tertiary period, and got chilled by the ice and snow of the glacial epoch down to its present misty and dreary wheat-growing condition!

If it were not for that, these odious habits of steady industry and perseverance might never have been developed in ourselves at all, and we might be lazily picking copra off our own Cocoonut-palms to this day, to export in return for the piece-goods of some Arctic Manchester, situated somewhere about the north of Spitzbergen or the New Siberian Islands.—Allen Grant, in Cornhill Magazine.

Horticultural Societies.

NEW-YORK HORTICULTURAL SOCIETY.

In variety of exhibits, as well as in excellence of many single specimens, the May Exhibition of this Society was fully equal to any previous meetings, and the courageous exhibitors who, in spite of one of the fiercest storms and rains, brought their plants from great distances, and filled all the tables, deserve much credit and praise.

The gem of the exhibition was, without a doubt, Woolson & Co.'s collection of Herbaceous Plants, filling a wide table through the entire length of the hall. If there had not been anything else but this, it would have been well worth a long journey to see it. There were many hundreds of species of perennial plants from all parts of the world, comprising, we should think, about everything in flower at this season; in fact, this exhibit was a botanical garden in itself.

About one-third of the hall was occupied by the brilliant display of Geraniums from Hallock & Thorpe, who, as usual, took overy prize they competed for. If a more magnificent and more meritorious exhibit of Geraniums has ever been made in this city, it has not been our good fortune to see it. There were double and single zonal, large flowering, regal, tricolor, bronze, silver, double and single Ivy-leaved, sweet scented, of every color and shape and size possible in the Geranium tribe.

There were several collections of tropical plants of rare beauty, also Orchids which, for the season, were unusually fine.

Of course there were quantities of beautiful Roses of all the leading kinds in bloom at this season; and, among the many other handsome exhibits we noticed collections of Tulips, Hyacinths, Lilies of the Valley, Pansies, Carnations, Amaryllis, Azaleas, Calceolarias, Chrysanthemums, and some flowers of *Nymphaea caerulea*.

Very large and well-grown forced Strawberries were shown by several exhibitors, and attracted deserved attention.

The special Rose and Strawberry Show will be held about the middle of June. Schedules of premiums may be had from the secretary, James Y. Murkland, 18 Cortlandt street, New-York.

THE AMERICAN INSTITUTE OF NEW-YORK.

The Horticultural Committee of the Institute has decided to make the Fruit and Flower Shows during the annual exhibition a more prominent feature, and has issued a neat little pamphlet enumerating the awards offered in the various departments. The prizes offered are very liberal, and being made public so early should induce florists and gardeners to exert themselves in raising superior show specimens.

The exhibition of Fruits and Flowers will open on Wednesday the 8th, and continue till Saturday the 11th of October. There will be a special show of Geraniums on October 15th, 16th, and 17th; and a special Chrysanthemum Show from October 29th till November 1st.

Persons intending to exhibit may receive the Premium List and Rules governing the Exhibition by addressing Secretary John W. Chambers, American Institute, New-York.

MASSACHUSETTS HORTICULTURAL SOCIETY.

The exhibition of May 10th showed that spring had indeed come, for, while the greater part of the contributions were from the greenhouse, and even the Pansies had received the protection of a cold frame, the gorgeous Tulips from John L. Gardner, the interesting, carefully-named, and therefore instructive collection of herbaceous plants from J. W. Manning, the Violets of solid purple from B. R. Freeman, and the pretty collection of wild flowers from Mrs. P. D. Richards, had received no other warmth than Mother Nature gives her floral children. Among those which are more dependent on art, the beautiful specimens of *Anemone coronaria* from E. L. Beard, in wonderful variety and richness of coloring, were perhaps the most striking. Mr. Beard also exhibited a collection of Pansies, which took the first prize, and there were fine specimens of Pansies from six other contributors. Edwin Sheppard's collection of cut flowers included some remarkably fine specimens of *Stephanotis floribunda*, and W. K. Wood's a new fragrant Crinum from the Cape of Good Hope. Hovey & Co. filled a stand with Zonale and other Pelargoniums (which, though small, were good), Azaleas, and Primulas. John L. Gardner had a stand of greenhouse plants, including Heaths, Eriostemons, and *Anopterus glandulosa*. B. G. Smith showed flowers of *Andromeda floribunda*. In the Vegetable Department, John B. Moore showed specimens of his new cross-bred Asparagus, which took the first prize, and there were also Rhubarb and Dandelions of outdoor growth, and Cnemidiums and Tomatoes from under glass. The only fruit was a dish of well-kept Baldwin Apples.

The society has decided to hold its Great Annual Rose and Strawberry Exhibition for two days instead of one, opening at 1 P. M. Tuesday, June 24th, and continuing day and evening until ten o'clock Wednesday evening. The society has been led to make this change by the unusual interest manifested by the public in all its exhibitions, and as the forthcoming Rose Show will unquestionably bring together the most extensive display of Roses of all classes ever shown in this country, it is not likely that even two days will suffice to accommodate those who admire this popular flower.

The present season is promising unusually well for outdoor Roses, and the quality of bloom is likely to be of a higher standard than usual.

In addition to the cash prizes offered by the society, a large subscription fund has been raised and most liberal special prizes are offered for Hybrid Perpetual Roses.

WEST TENNESSEE HORTICULTURAL SOCIETY.

The long-anticipated Strawberry and Flower Exhibition of this young and vigorous society, held at Jackson on May 9th and 10th, has passed, and all who attended it had "a glorious time." Many prominent horticulturists were present, and thousands of visitors thronged the grounds. The whole affair was a grand success, and cannot but draw the attention of fruit-growers to the great advantages of the hitherto little known superior fruit-lands of this section. Large and excellent as the exhibition was, it would have been of still greater dimensions had

not a severe hail-storm during the previous week made sad havoc among the Strawberry fields of the vicinity.

The largest single berry, a *Warren*, filling an ordinary tea-cup, was exhibited by Mr. John T. Stark, who had also among his exhibits a quart of *Sharpless*, which contained only twenty-three berries.

Mr. John W. Rosamon, of Gadsden, the president, was awarded the premium for the best shipping variety, a quart of what he calls *Crescent Seedling*. The berries had been picked early on May 7th, and were perfectly fresh and firm on May 10th. Mr. Parker Earl, Dr. J. H. Sandborn, and other experienced fruit-growers, pronounced them *Capt. Jack*, however, and the matter is causing considerable comment in fruit circles. It would be strange, indeed, if locality and soil should transform so soft a berry as the *Crescent* into a firm, first-class shipping berry. We should like to see a leaf of this supposed *Crescent*, to ascertain whether the foliage has changed also.

AMERICAN ASSOCIATION OF NURSEYEMEN.

The ninth annual session of this society will be held in Chicago, Ill., commencing Wednesday, June 18th, at 10 A. M., and continuing three days.

Among the objects sought by the association are: The cultivation of personal acquaintance with others engaged in the trade; the exchange and sale of nursery products implements, and labor-saving devices; to procure quicker transit, more reasonable rates, and avoiding needless exposure of nursery products when in transit; the perfection of better methods of culture, grading, packing, and sale of stock; the exhibition and introduction of new varieties of fruits, trees, plants, etc.; to promote honest and honorable dealing.

This session promises to be of unusual interest, and will no doubt be attended by many of our prominent nurserymen, seedsmen, florists, as well as amateur horticulturists. The beneficial influence of this society becomes more and more apparent with each succeeding year, and the valuable information furnished through the papers read at these meetings, and the discussions thereon, could hardly be obtained elsewhere. Any one at all interested in horticulture will be well repaid by attending this session.

IT PAYS TO ADVERTISE IN THE AMERICAN GARDEN.

From Thos. W. Weathered, manufacturer of Hot Water Apparatus for warming Greenhouses, Graperies, etc., 46 Marion street, New-York:

"I am pleased to state that THE AMERICAN GARDEN is the best advertising medium I have ever used."

From Delos Staples, Supt. Willow Ridge Fruit Farm, West Sebawa, Mich.:

"I have had my advertisement in *twenty* of the leading agricultural papers this spring, and it will only be doing justice to you to say that I received more orders from my advertisement in THE AMERICAN GARDEN than all the rest put together, with but a single exception."

From H. Gillette, Proprietor of the Highland Park Nurseries, Ill.

"As an advertising medium THE AMERICAN GARDEN is simply immense. It has brought me more orders than any paper I have ever advertised in."

NOTICES OF THE PRESS.

THE AMERICAN GARDEN is a model of beauty and neatness.—*Farmer's Home.*

THE AMERICAN GARDEN is of special interest and value to all who have gardens of their own.—*Boston Saturday Evening Gazette.*

THE AMERICAN GARDEN is one of the most excellent publications of its kind in America.—*North-western Farmer, Oregon.*

THE AMERICAN GARDEN is invaluable for every gardener and fruit-grower; its teachings are sound and sensible.—*City and Country.*

THE AMERICAN GARDEN appears in a more attractive shape than formerly, and is steadily improving in literary quality.—*Gardener's Magazine, London, England.*

THE AMERICAN GARDEN is a gem to be admired for its beauty and richness of contents. Any one desiring to learn all about the culture of flowers, fruits, and vegetables, should subscribe for it.—*The Item.*

We are pleased to notice the success of THE AMERICAN GARDEN, published by B. K. Bliss & Sons, New-York City, and edited by that most genial and experienced horticulturist, Dr. F. M. Hexamer. This journal is carefully edited, attractive in appearance, and decidedly readable in all its departments.—*Green's Fruit Recorder.*

If there is a better strictly horticultural journal published than THE AMERICAN GARDEN we have not yet seen it, and it could not be otherwise under the skillful, because practical, editorship of our good friend, Dr. Hexamer. When we say he is unquestionable authority on matters of horticulture, that's enough; and his paper shows it.—*Chatham Courier.*

OUR BOOK TABLE.

Young Men's Christian Association of New-York.—Thirty-first Annual Report, showing the growth and present condition of this admirable institution.

Kansas State Board of Agriculture.—Report for April, containing a summary of reports of correspondents as to the condition of Wheat, Rye, and Fruit, together with a paper on noxious insects, pig-feeding experiments, the agricultural position of Kansas, etc.

Godley's Lady's Book for June opens with a fine steel engraving of Alfred Ward's portrait of Helen Mathers, the celebrated English authoress, whose new story, "Dreeding of the Weir," will commence with the July issue of the magazine. The present number contains a great deal of spirited and readable matter. "The Ship of Fate," by Constance Du Bois, is especially notable; the theme of the story is a matter of history. In addition to the articles mentioned, the magazine contains many interesting stories, poems, etc., besides the usual handsome illustrations and supplements.

Home Science.—A monthly magazine, published by Selden R. Hopkins, 29 Warren St., New-York. The initial number of this elegant publication is received, and it is with much interest that we have perused its pages. There is a wide, boundless field for such a magazine, devoted to science in the home, and of the home, and the publishers as well as the editor seem well prepared and amply capable to carry out this praiseworthy undertaking. We wish them full success in their endeavor to "sweeten as well as enlighten, to shed the fragrance as well as the brightness and warmth of living truth over every home." Among the brilliant array of contributors to this number are: Rev. T. DeWitt Talmage, Rev. Robert Collyer, Prof. Edw. P. Thwing, Dr. Dio Lewis, Dr. Byron D. Halsted, Rev. R. S. Stearns, Miss M. E. Winslow, Nathaniel J. Allen, and others.

Michigan Horticulture.—Thirteenth Annual Report of the Secretary of the State Horticultural Society. Of the many similar reports which reach our table, none are more highly appreciated and more frequently referred to than these carefully edited and elegantly finished volumes. Mr. Chas. W. Garfield, the accomplished secretary, takes great pains to embody in his work only matter of

real value to horticulturists, and as he does not confine himself to the proceedings of the society only, but gives in his "Portfolio" an epitome of the cream of the entire horticultural press of the country, selected with commendable discrimination and sound judgment, a series of these reports forms almost an encyclopedia of horticulture. A "Primer of Horticulture" which we have mentioned in a previous number is also embodied in the volume. Every member of the society is entitled to this model report, which in itself is worth many times more than the member's fee.

Profitable Poultry-Keeping, by Stephen Beale, edited by Colonel Mason C. Weld. Published by George Routledge & Sons, 9 Lafayette Place, New-York. Elegantly bound in cloth; price, \$1.50. The publishers, in bringing this excellent work within the reach of every one, have ingratiated themselves to every American poultry-raiser; and they are to be congratulated upon having been fortunate to secure the services of so competent an editor as Colonel Mason C. Weld, whose extensive practical experience and thorough knowledge of the subject make him especially qualified for the work. As a hand-book and guide to those who intend to raise poultry for profit as well as for pleasure, the work stands unrivaled, and in heartily commending it to every one who seeks information about any or all branches of the subject, we say with the editor: "Here, take this book of Stephen Beale's, study it carefully in whatever it is applicable to your needs, and follow it. You will find in it a safe guide, and you will almost surely come out well with your poultry the first year."

"What and Why," received from Col. Albert A. Pope, Boston, Mass., is a finely printed and unique little volume upon cycling matters. The contents are made up of information which will doubtless create a renovation among wheelmen, for within the pages of the book is an ocean of matter in a bucket. "Some Common Questions" are catechetically answered in the plainest and most concise language,—questions with answers which give a complete history of cycling, its growth, usefulness, and popularity. A chapter christened "Legal Lifts" cites every bicycle case brought before the courts, and fully explains the rights of wheelmen. The book also gives hints on what the cyclist should wear; mentions the little conveniences which might be forgotten; gives comparative records in walking, running, rowing, skating, trotting, tricycling, and bicycling; and closes with extracts from the public utterances of leading professional and public men. The sprightly semi-humorous sketch entitled "A Preparation of Iron," with an unmistakable bicycle moral, by the author, Chas. E. Pratt, Esq., is well worth reading.

The June Continent contains an unusual variety of interesting material from the pens of writers who are well and favorably known. Among them are John Vance Cheney, who writes of Richard Henry Dana; Margaret Vandegriff, who contributes a pleasant story, entitled "A Permanent Investment"; Mary N. Prescott and D. H. R. Goodale, who have poems; Rose Porter, who begins in this number a short serial, "Poetry and Prose; or, A Honeymoon Dinner"; Henry C. McCook, the course of whose "Tenants of an Old Farm" brings him once more to the consideration of spiders, which are his specialty; A. W. Tourgée, who discusses in his own vigorous way questions political, economic, and literary; and others who have interesting things to say and an agreeable way of saying them. The issue of a monthly edition of *The Continent*, in addition to the regular weekly numbers, is certainly justified by such installments as this part for June, which is rich in all the essentials of a well-stocked magazine. The illustrations are generous in number, of excellent quality, and are from the hands of illustrators of note.

"Everybody's Paint Book," a complete guide to the art of outdoor and indoor painting, designed for the special use of those who wish to do their own work, and consisting of practical lessons in paper-hanging, varnishing, polishing, staining, tints for renovating furniture, and hints on with a full description of the tools and materials used. Precise directions are given for mixing

paints for all purposes. Illustrated. By F. B. Gardner. Price, one dollar. M. T. Richardson, Publisher, 7 Warren Street, New York.

This book has evidently been written to supply the wants of that numerous class who either cannot afford to employ the services of a professional painter, or who, for economical reasons, prefer to do odd jobs of painting about the house themselves. Great care is manifest throughout the 190 odd pages, of which it is comprised; to present each topic treated so clearly and fully that no one need fail in any job of painting he may wish to undertake from lack of explicit directions. The farmer may learn from this book how to paint his implements, wagons, and buildings, and the ladies are told how to renovate furniture, picture frames, etc., and make them look like new. A chapter on spatter work shows the girls how to make a variety of beautiful pictures at a trifling expense. Altogether, the book, which is sold at a reasonable price, may profitably find a place in every household. It is printed on fine paper, handsomely bound, and copiously illustrated.

Agriculture of Massachusetts.—Annual Report of the Secretary of the Board of Agriculture, with returns of the finances of the Agricultural Societies. Like its predecessors, this handsome volume is full of interesting and valuable information. It gives a full account of the proceedings of the annual meeting of the board, held at Lowell in December last, President Varnum's opening address, all the papers read during the session, and the discussions thereon. We have only space to mention a few of those which appeared to us most interesting: Veterinary Problems of the Day, by Dr. D. E. Salmon; Experiments with Fertilizers, by John W. Pierce; Market Gardening, by J. B. Moore; Jersey Cattle in America: their Present and Future; Fertilization of our Farms, by Winfield A. Stearns; Report on Commercial Fertilizers, by Professor C. A. Goessman. Then follow the Annual Report of the Director of the State Agricultural Experiment Station at Amherst; a paper on Sunbines on the Farm, by Dr. James R. Nichols; the report of the Martha's Vineyard Agricultural Society; and the report of the Massachusetts Agricultural College. Not the least interesting part of the volume are Secretary Russell's introductory remarks, which, although occupying but four pages, give as clear and comprehensive a statement of Massachusetts agriculture as would have taken many a man a whole volume to make known; but then the secretary has a peculiar knack of putting bulky matter in nut-shells. He lays special stress upon the importance of devising means for counterbalancing droughts, which are constantly becoming more frequent and disastrous in New England; irrigation, manuring, and especially better cultivation are suggested.

CATALOGUES RECEIVED.

Summit Lawn Poultry-Book, illustrated, showing Poultry, Plans, Houses, etc., as used at the yards of R. B. Mitchell, at Arlington Heights, Ill. This handsome catalogue contains, in addition to descriptions and prices of the stock offered for sale, a great deal of interesting and valuable information.

Chas. P. Willard & Co., 280 to 284 Michigan Street, Chicago.—Illustrated catalogue and price-list of Creamery Apparatus, General Dairy Supplies, Steam Engines and Boilers, Horse Powers, Farm Mills and Feed Cutters. Special attention is invited to their celebrated "Elgin Butler Tubs."

The American Fruit Evaporator.—The handsome lithographic Manual on Evaporating Fruit, sent free by the American Manufacturing Company, Wagnersboro, Penn., should be read by all fruit-growers. It contains much information not elsewhere found in this profitable and important industry. Send for it.

The Northern Sugar-Cane Manual, together with illustrations, descriptions, and price-list of Cane Mills, Evaporators, Kettles, Defecators, Juice Pumps, Horse Powers, Steam Engines, and other American Sugar-Cane Machinery manufactured by George L. Squier, Buffalo, N. Y. The Manual on the Northern Sugar-Cane Industry, treated by Professors Weber and Soovell, contained in this pamphlet, is of great value to all interested in this industry.

ANSWERS TO CORRESPONDENTS.

Eucalyptus.—C. O., Prescott, Ark.—The Eucalyptus cannot be grown where the thermometer sinks much below the freezing point; it is therefore not hardy north of the Gulf States.

Plant for Namo.—Mrs. C. H., Lills, Pa.—The slip sent is a species of Mesembryanthemum. The plant delights in a hot, sunny position and light, sandy soil. It is readily propagated by cuttings, if not kept too moist.

Caladium esculentum Rotting.—Mrs. M. O. S., Roxbury, Pa.—The bulbs should not be planted before the ground is dry and warm, and then they should not be watered before they commence to grow, else they are very apt to rot; if started in pots in hot-houses the same precautions in regard to watering should be taken.

Early Strawberries.—T. H. B., Crisfield, Md.—Crescent, Duchess, Wilson are among the earliest market berries. Home-grown plants, if pure, well-cultivated, and properly cared for, are just as good as those procured from the North, in fact better, if the risks of transportation are put in consideration.

Squash Beetles.—Mrs. O. H. Quilman, Mo.—As soon as the plants appear above ground they should be dusted over with air-slacked lime every morning while the dew is on the leaves. Plant a dozen seeds in each hill and when the plants are large enough to be secure against the beetle, pull out all but the two or three strongest ones.

Black Currants.—S. E., Bay View, Wis.—All Currants, and especially the black varieties, do better on rather heavy, somewhat moist, than on sandy soil. If some clay can be added to the sand it will prove very beneficial, and good heavy mulching during summer, extending three to four feet around the bushes, will have an excellent effect.

Clematis.—A. P., Middletown, Conn.—It is the nature of the plant to die down to the ground in winter, but it should make a better growth during summer. They thrive best in rich soil of a light, loamy texture, but thorough drainage is indispensable to their healthy development. Mulching with old yard-manure will be found beneficial.

Bulbs Rotting.—C. M. H. S., Chatham, N. J.—Bulbs may become infected by various diseases, and some forms will remain in the ground for several years, attacking all the bulbs that may be planted in it, but the most frequent cause of rot is want of drainage. In deep, light, and well-drained soil there is little danger of bulbs rotting.

Vallota purpurea.—C. W., Port Chester, N. Y.—This bulb should be partly dried off during winter. It does not require very large pots, but if too crowded, it should, of course, be changed into a larger pot, in a mixture of equal parts of loam, leaf-mold, and sand. While growing or flowering it requires a great deal of water and full exposure to light.

Greenhouse Shelves.—N. T. L., Astoria, N. Y.—Plants that require a moist atmosphere do better when the pots are placed on sand, coal-ashes, or moss; in stove-houses and propagating houses this is especially desirable, but in ordinary greenhouses most plants succeed just as well, if not better, on the bare shelves, provided the watering is properly attended to.

Azaleas in Summer.—Mrs. E. J. T., Green's Farms, Conn.—The plants should not be placed in complete, but only partial shade, and never directly under the drip of trees. Good drainage is essential, and frequent re-potting—that is, as often as the roots are found to fill the entire pot—is necessary. They like a dark, peaty soil with a good part of sand. Frequent syringings of the foliage conduces also to the health of the plants.

Moss in Meadows and Lawns.—W. A. S., Conn.—The almost invariable cause of moss growing in meadows is that the ground is too wet for the growth of cultivated grasses. When only a few small, low spots are thus affected the moss may be pulled out with a prong hoe, the depressions filled with clean soil and grass seed scattered over it. But where a considerable space is overgrown the only radical cure is drainage, followed by re-plowing and re-seeding.

Alfalfa, or Lucerne.—B. T. E., Bovinia, N. Y.—In the Northern States the seed should be sown in spring, as soon as the ground becomes dry and

warm, but in the South fall sowing is more advantageous. The plant requires a dry and very deep soil; it is useless to try it on heavy clay or wet bottom lands. It may be sown in drills about eighteen inches apart, and cultivated with horse implements, or sown broadcast. For drill sowing it requires about ten pounds of seed per acre; for broadcast, about twenty pounds. It should always be sown alone, without the addition of grain or grass seed. When once established on fertile soil it lasts for many years, grows rapidly, and may be cut three and four times a year. An annual dressing of three to four hundred pounds of superphosphate of lime helps it wonderfully.

Melons and Squashes Dying.—P., Flushing, N. Y.—The Striped Beetle does not only destroy the young plants, but its larva—little white worms, about a third of an inch long—pierce into the roots of large, thrifty vines, which, in consequence, wilt and die. The beetle deposits its eggs near the roots, and whatever prevents its getting near them is a sure cure. Paris Green, Hellebore, Slug Shot, Buhach, are all used with varying success, but nothing is so certain as protecting the young vines with light frames covered with mosquito netting. It has been stated by good authority that small pieces of phosphorus, common friction matches even, placed around the stem, will drive away the beetles.

The Squash Borer comes later, and is a still more insidious enemy. It is the larva of a moth that lays her eggs on the stem near the roots, and which, as soon as hatched, gnaws into the stem, destroying its substance and life, similar to the Apple and Peach tree borer. Filling the vines well up is a partial preventive, and phosphorus is said to be equally effective as against the Striped Beetle.

The Zero Refrigerator, manufactured by Alex. M. Lesley, 1336 Broadway, New-York, is, as we know from many years' use of one, excellently adapted for its purpose. It is neat, simple, economical, and effective.

The efficacy of Bulach, the new California Insect Powder, is so well known to entomologists, that its value as an insecticide is firmly established. We have lately experimented with it, and were highly pleased with the results. If properly applied, it accomplishes all that is claimed for it, and has the great point in its favor that it is entirely harmless to human beings, as well as to house and farm animals.

We invite the attention of the lady readers of THE AMERICAN GARDEN to the announcement of Messrs. James McCreery & Co., of New-York, in this number. This well-known dry goods firm offer a variety of exceptionally choice bargains in fancy summer silks, black silks, and misses and children's suits, to close out their summer stock. Orders by mail receive as careful attention as orders in person, and satisfaction guaranteed.

ACCIDENT INSURANCE.

Every one traveling for pleasure or business is naturally more or less in danger of meeting with accidents, and it is a wise person who makes reasonable and prudent provision for his family in case misfortune should overtake him. The United States Mutual Accident Association, 320 and 322 Broadway, New-York, whose advertisement appears on another page of this number, offers remarkable inducements in the way of indemnity in case of accidents, and the reliability and honorable dealing of the Company are so well known as not to require confirmation. We advise every one to send for a circular, and see for himself how small an investment may save him or his family from want.

IMPORTANT.

When you visit or leave New-York City, save Baggage, Expressage, and Carriage Hire, and stop at the Grand Union Hotel, opposite Grand Central Depot. 600 elegant rooms, fitted up at a cost of one million dollars, reduced to \$1.00 and upward per day. European Plan. Elevator. Restaurant supplied with the best. Horse cars, stages, and elevated railroad to all depots. Families can live better for less money at the Grand Union Hotel than at any other first-class hotel in the city.

TAKE NOTICE.

For 50c. (in stamps) 200 Elegant Scrap Pictures. No two alike. F. WHITING, 50 Nassau St., N. Y.

HAMMOND'S SLUG SHOT,

AN INSECTICIDE AND FERTILIZER

Ready for use and safe.

GUARANTEED TO DESTROY

Potato Bugs, Chinch Bugs, Rose Bugs, Slugs,

Aphis Lice, Worms, Caterpillars, and the Striped Bug upon Melons, Cucumbers, Squash and all insects injurious to Grape Vines, Cabbage, Tobacco, Cotton, or Egg Plants, Currants, Fruit or Ornamental Trees, Rose Bushes, and all Shrubs, Greenhouse, and Hardy Flowering Plants.

SLUG SHOT was prepared at first solely to destroy the Potato Bug in gardens, but its valuable properties for the destruction of all kinds of insects, caterpillars, and other vermin, have induced the inventors to manufacture it on a large scale, by which it is offered at a reduced price (as cheap or cheaper than Paris Green), and always of uniform strength, and ready for immediate use without the trouble of mixing.

SLUG SHOT contains, in minutest quantity, **POISON!** destructive to all insect life, which is most thoroughly diffused through natural and chemical fertilizers, and kills the bug in all stages of its growth. The insect eats it in the minutest quantity, and then appears to become paralyzed, often dying on the leaf without falling to the ground.

It is an insipid powder, and does not harm vegetation; on the other hand, it is a manure. Dust it on the plants plentifully, either by hand or with a dusting-tin. You can easily make a duster by taking an old fruit can, perforating the bottom, and nailing the can to a stick.

QUANTITY TO AN ACRE.

When plants are small, about 20 pounds are needed; or, take a handful and throw it over each hill, covering the leaves. It does no harm to plants, but, on the contrary, invigorates them greatly.

The color and odor of **SLUG SHOT** prevent it in any way being mistaken or used for wrong purposes, and its composition is such that it is out of the question for a human being or quadruped to take enough to do any harm. Mr. Hammond, the originator, and his men have worked days and weeks in it without any ill effects whatever.

Pamphlets, giving a full description, with directions for use and certificates from those who have used it for the various purposes for which it is recommended, mailed free to all applicants.

SLUG SHOT is in strong, neat packages, properly labeled, weighing respectively 5, 10, and 15 pounds each. These packages are packed in barrels for the trade. The barrels will hold from 200 to 215 pounds net. Each barrel has a large poster and 100 circulars.

The price is a half cent less per pound when ordered in bulk than it is in packages. Prices, in packages, 5 lbs. 30 cents; 10 lbs. 50 cents; 15 lbs. 75 cents; in barrels in bulk, 4 1/2 cents per pound. Slug Shot cannot be sent by mail.

Prices to the trade given upon application.

Manufactured by **B. HAMMOND & CO. Mt. Kisco Paint Works, Mt. Kisco, N. Y.**

This HANDSOME WRITING DESK FREE to You!

This illustration represents, upon a small scale, a very handsome and desirable import from Europe. Our illustration represents a large quantity of which we have lately the appearance of a large book in handsome binding. The outside of the Desk is of bright red leatherette, or imitation leather, embossed in gold and black; the interior is finished in dark green, or imitation leather, and has compartments for pens, pencils, and pens, likewise supplied with an ink bottle. It is a handsome as well as durable writing desk, and something that everybody needs and has no excuse for not having. We publish the well-known and popular illustrated Literary and Family Paper, **The Firelock** at 10 cents, and, wishing to increase its circulation to 100,000 or more during the next few months, we now make the following unprecedented offer: Upon receipt of only Forty-two Cents in postage stamps we will send **The Firelock** at Home for Six Months, and to each subscriber we will also send Free and post-paid, the handsome **Writing Desk** above described. The **Firelock** at Home is a handsome 16-page, 61-column paper, brilliantly illustrated, and filled with interesting Serial and Short Stories, Sketches, Poems, Useful Knowledge, Biographies, Travels, Wit and Humor, and everything to amuse, entertain and instruct each member of the family. It is one of the largest, handsomest and most interesting family papers published, and you will be delighted with it, as well as with the valuable and useful presents we offer. Remember, we send this splendid **Writing Desk** free to all sending 42 cents for a six month's subscription to our paper. Five subscriptions and five **Writing Desks** will be sent for \$1.68; therefore by getting four of your friends to send with you, you can secure your own paper and present free. This great offer is made solely to introduce our paper, take advantage of it at once! Satisfaction guaranteed or money refunded. Address, **S. H. MOORE & CO., Publishers, 27 Park Place, New York.** As to our reliability we refer to any publisher in New York, or to the Commercial Agencies.

The American Garden

A Monthly Journal of Practical Gardening.

DR. F. M. HEXAMER, Editor.

B. K. BLISS & SONS, Publishers.

Vol. V.

NEW-YORK, JULY, 1884.

No. 7.

PICTURESQUE GREENHOUSES.

To the artistic arrangement of greenhouses there is yet too little attention given by amateur floriculturists. While a mere plant-house is built and arranged for the sole purpose of growing plants, the greenhouse

large and beautiful subtropical plants, which could not be grown well in pots, in a moderate-sized greenhouse, may be made to thrive to perfection in such a glass-covered garden. The hardier Palms, Tree Ferns, Bamboos, Dracænas, and many other beautiful foliage

tration shows a very beautiful arrangement of this kind, which has been constructed in a conservatory near this city. In this case the wall was built for the special purpose of ornamenting it in this manner. Over the niche in the wall tiny streams of fresh

ORNAMENTED GREENHOUSE WALL.

proper—the conservatory—should at all times present a green and pleasing appearance instead of the familiar rows of red pots.

The pleasure that may be derived from a glass structure arranged as a miniature garden is infinitely greater than when the house is given up entirely to potted plants. Many

and flowering plants can be grown in a temperate house.

The end walls of greenhouses present, not infrequently, the least inviting part of the whole, notwithstanding that there are but few instances in which these cannot be made a most attractive feature. Our illus-

water, brought from a spring on higher ground, are constantly trickling, and are gathered below in a miniature pond, which serves as an aquarium. On its margins various aquatic plants are growing in remarkable luxuriance, and produce a most striking and magnificent effect.

The Vegetable Garden.

SEASONABLE HINTS.

Transplanting in Summer.—Many persons suppose that the most important point in setting out vegetable plants is to have the weather just right, regardless of the condition the plants are in at the time. That a damp, cloudy day is more favorable for transplanting than a dry and windy one, no one will dispute; but it is not prudent to let plants received from a distance, or such as stand too thick in the seed-bed, spoil while waiting for rain. It is astonishing how much drought and sun young Cabbage-plants can bear, provided they are of first quality and are set out carefully.

Plants that have been packed for several days will generally be found to have heated somewhat, in which case they should not be planted out at once into dry soil and exposed to the direct sun. They should be heeled in for several days in a damp, shady place, until they have fully recovered, and become fresh and green again. But it is of no use to take the whole bundles of fifty or a hundred plants and just cover them with a little soil. The bundles have to be opened, the plants spread out close together, and the roots carefully covered with fine soil, pressing it down firmly and adding more loose soil. In this state they may remain one or two weeks without injury; they will, in fact, improve all the time, and suffer no check at the final transplanting.

The Cabbage-worm.—After trying various devices for destroying this pest, our correspondent, L. S. A., comes to the conclusion that "the true method for the destruction of the Cabbage-worm is to catch the butterflies with a net attached to a wire hoop two feet in diameter, and fastened to a stake six or seven feet long. With such an implement, a boy eight or ten years old can protect a field of an acre or more. The catching must be general, however, and operations must begin with the appearance of the butterflies in spring, thus cutting off the ancestry of an otherwise large progeny in July.

Cucumbers sown during the first week in July will produce Pickles fit for use about the middle of August, provided the ground is in proper condition. Planted as late as the 15th of this month, even, a good crop may be secured before frost. For pickling, the *Green Prolific* is the best variety, and the *Improved White Spine* for fresh use.

Cucumbers require a deep, rich, rather moist soil, and have to be kept scrupulously clean until the vines cover the entire ground. Pickling should commence as soon as there are any Pickles of proper size, say two to three inches, and be repeated every day, or at least every other day, through the season. It is fatal to the productiveness of the vines to leave those on that are too large or misshapen. A single Cucumber allowed to go to seed on a plant will soon end its bearing.

The Squash Borer.—A solution of an ounce of saltpeter in a gallon of water is recommended as a preventive against the Borer. As soon as the young plants appear above ground, the solution is poured over them in sufficient quantity to saturate the ground. This should be repeated three or four times at intervals of four or five days.

RAISING EARLY POTATOES.

Early in June, Dr. E. H. C. Goodwin left at our office some beautiful specimens of Beauty of Hebron Potatoes, raised by him at Governor's Island, in New-York bay. They were of marketable size and condition, and, at this season, something so remarkable that we were anxious to learn how they were raised. To an inquiry, the doctor obligingly replies:

"The Potatoes were planted in the open ground on March 29th, the thermometer between that date and April 1st falling as low as 25°. On April 8th the glass of the cold-pits was covered with ice, and the following day it snowed. The sprouts became visible above ground on April 16th, and on the 21st all were well up. The first digging was made on June 4th, and others occasionally till June 10th, with a total yield of over twenty bushels from a piece of ground fifty by twenty-five feet.

"Toward the end of February, I put the seed Potatoes in a shallow basket and set them in a rather warm room (say 60°), with plenty of light. By the time the ground can be worked they have made short, thick, dark green shoots, with rootlets showing. They are then cut to the proper size, dried or rolled in ashes, and planted with a pretty liberal application of ground bone and guano in the furrows. Should the season be too backward to allow the ground to be worked at the time the Potatoes should be cut,—which is apparent by the withering of the tubers,—the sets are placed in shallow boxes, with a little soil sprinkled over them. When the ground is in proper condition, the sets are planted out, at which time they have sometimes made roots an inch long.

"If there is danger of severe frost after the vines have appeared above ground, I cover them with soil, which operation serves as a first hoeing at the same time; but a slight frost does not injure them. They are then worked and hilled in the usual way. The bugs are not likely to attack them, as the vines have made nearly their full growth before the larvæ make their appearance. To guard against frost, a mulching of straw might be applied, which need not be removed afterward, and, if heavy enough, would save all after-cultivation.

"Although I have tried this method only on a small piece of ground, I see no reason why market gardeners near large cities could not make it profitable on a larger scale."

TURNIPS.

For a number of years I had not succeeded with my Turnip "patch." The Turnips were either too small, some too thick, or so bitter as to render them unfit for the table. My hay crop, fell short one season, and I concluded that I must raise some kind of root crop in order to make the "fodder" last until spring, as I did not care to dispose of any of my stock. The question arose, where should I find a suitable place to plow and sow the seed.

At the south end of my wood-lot, in one corner, was a clearing perhaps containing three-quarters of an acre of ground. Formerly the spot was covered with a thick growth of White Oaks, and the stumps could now be seen on every hand. The soil, however, was well tilled, although it had not been plowed, no doubt, since the trees were cut, some thirty

years or so. I concluded at length to try and see what kind of a patch it would make, and so early in July plowed the corner and fenced it in (as I pastured the lot), harrowed the soil well, and when the time came to sow the seeds, about the twenty-fifth of the month, I gave the entire piece a liberal dressing of manure made very fine, dragged it in, sowed the seed (Yellow Globe), and waited for the result.

They came up finely, and I saw at once that I was to have a good Turnip patch for once. I now went over the entire piece, and pulled up all those in bunches, or where too thick, and so had the young Turnips about the right distance apart. They came on, and grew rapidly, and now and then we had showers, so that the soil was sufficiently moist for the Turnips, and a steady and uniform growth was kept up all of the time. It was real pleasure to watch their growth. The soil was very rich of itself, without adding any sort of fertilizers; and so the Turnips grew until frost came, and the oxen were hitched on to the cart and driven to the patch. We commenced at one corner, and after working for several hours pulling and cutting off the tops, we could not see that we were making a very large "hole" in the piece, as the boys would say. They were very large, but quite uniform, owing, in part, no doubt, to our thinning them out early in the season.

But it is the flavor that we desire to speak of, and I think I may say that the old negro cook was right when she said of them: "Dey's jis sweet as honey." I do not recollect of finding a bitter one in the whole lot, so that the crop was particularly valuable for marketing. I sold many bushels of them in all the towns around, and put in my cellar two hundred and fifty bushels of as nice eating and feeding Yellow Globe as ever grew.

Now, what was the secret of my success? There was simply no secret at all about it. I chose the right soil; new land always, if you wish for sweet Turnips. I had a good crop, and what I sold brought me good prices. Now, bitter Turnips may be just as good for stock, though I would rather have sweet ones, and the crop may be just as large; but if the crop is short all around, and the market is bare, you cannot supply the demand unless the roots are fit for the table.

E. R. BILLINGS.

A PLEA FOR COLORED BEANS.

An article on "White Beans" in a previous number of THE AMERICAN GARDEN suggests a good word for the colored or speckled sort, often called "Six Weeks Bean," as it comes forward very early.

Those red-eyed or speckled Beans are very delicious, cooked in the same way as white Beans, and much richer. They are best when parboiled, and the water changed. It is true they retain their color, but that does not injure even their looks, and they only need trying to become a favorite dish.

The small black Beans that we call "Mock Turtle Soup Beans," are, perhaps, still better, although we have only used them for soup in the same way as split Peas, boiling thoroughly and changing the water more than once, then squozing or straining them through a colander. Both these varieties are decidedly better for winter use than Lima Beans.

S. H. H.

MUSHROOM CULTURE.

Of all the odible Mushrooms, the common Meadow Mushroom (*Agaricus edulis*) is the only one adapted for cultivo, and, with proper care and management, it can be grown almost anywhere and at all seasons. Nowhere has the cultivation of this delicacy reached so high a state of perfection as in the vicinity of Paris, in France, and the following description of the methods practiced there, given by Messrs. Vilmorin-Audrieux, will, therefore, be of interest to those who contemplate Mushroom culture:

The chief conditions to obtain a satisfactory result consist in growing Mushrooms in a very rich soil and under a genial, as nearly as possible even, temperature. To secure this latter condition, the culture is often carried on in cellars; but any other locality, such as sheds, outhouses, stables, railway arches, etc., will suit as well, provided that either naturally or by artificial means the temperature does not exceed 86°, nor fall lower than 50° Fahr.

The first thing to be considered after the choice of a convenient locality is the preparation of the Mushroom bed. The most essential material being horse-droppings, preference to be given to those of well-nourished animals, collected as dry and as free from straw as possible. This fermenting material would be too hot to be used by itself at once; to reduce the strength it should be well mixed with one-fourth or one-fifth of its bulk of good garden soil,

TUB.

when the bed may be prepared immediately, the fermentation being slow and the heat produced only moderate and even. Care should be taken to construct the bed in a dry place, and to make the sides firm and tidy.

If it is intended to use the horse-dung by itself, as the Mushroom-growers around Paris do, it is necessary to allow the first heat to evaporate, which is done by piling the droppings as they come from the stable in successive layers to the height of about three feet, in a dry spot, removing all foreign matter from it and pressing it into a compact mass, sprinkling with water such portions as are very dry. In this state it is to be left till the most violent fermentation has passed, which is generally the case in six to ten days, when the heap is to be re-mado, taking care that those portions which were outside, and consequently less fermented, are placed inside, to insure an equal temperature. It should be well mixed and firmly placed, so that the whole may be of a similar texture.

Generally, a few days after being re-made, the fermentation is so strong as to render it necessary to be made up a third time.

Sometimes, after the second operation, it is ready for the beds being made, which may be seen when the hoating material has become brown, the straw which is mixed with it has lost almost entirely its consistence, when it has become greasy, and the

small is not longer the same as when fresh. It is difficult to obtain a good material without preparing a heap of at least three foot each way; and if that quantity is not required for making the beds, the surplus may with advantage be used in the kitchen-garden.

The material is now brought to the place where the beds are to be made, which may be of any form and size; but experience has shown that the best way to make use of

MOVABLE BEDS AGAINST A WALL.

space and material is to raise the beds to a height of twenty to twenty-four inches, with a width of about the same at the foundation. An excessive rise of the temperature, in consequence of renewed fermentation, is to be less feared than when the beds are of larger dimensions. When a large place is at disposal, preference is given to beds with two slanting sides; when the beds are resting against a wall, and consequently present but one available side, the width ought to be less than the height.

Barrels sawn in two, so that each part forms a tub, are well adapted to form beds, as well as simple shelves on which sugar-loaf-shaped beds may be raised, which, already formed, may be carried into cellars, etc., where the introduction of the raw materials would be objectionable.

The beds thus established should be left for a few days before spawning, to see whether the fermentation will not be renewed with excessive vigor, which may be ascertained by the touch of the hand, but it

BED WITH TWO SIDES PARTIALLY UNCOVERED.

is safer to use the thermometer; as long as the temperature exceeds 86° Fahr. the bed is too hot, and it should be allowed to cool by itself, or by making openings with a stick to allow the heat to escape.

When the temperature remains at 76°, it is time for spawning. Prepared spawn is found in the seed stores at all times, which may be kept without trouble from year to year. The spawn sold in France is not in

bricks or solid lumps, as in England, but in light masses of scarcely half-decomposed loose and dry litter.

A few days before spawning, it is advisable to expose the spawn to a moderately warm moisture, which will insure a safer and more rapid growth; it should be broken up in pieces about the length and thickness of the hand by half that width, and inserted into the bed at a distance of ten to twelve inches each way; on beds twenty to twenty-four inches in height, which are mostly in use, it should be inserted in two rows, dove-tail fashion.

Where the bed is situated in a place under cover and of an even temperature, nothing else is to be done but to wait for the growth; if, however, the bed is placed in the open air and exposed to change of the weather, it must be covered with long litter or hay to keep a uniform temperature all around the bed.

Under favorable circumstances, and if the work has been done well, the spawn ought to show activity in seven or eight days; it is advisable to look to it, and to replace such spawn as might not thrive, which can be seen by the absence of white filaments in the surrounding material.

Fifteen to twenty days later the spawn ought to have taken possession of the whole bed and should come to the surface; the top and sides of the bed should then be covered

MOVABLE SHELF.

with soil, for which a light mold in preference to a heavy one should be used, slightly moistening it, without making it too wet. If it does not naturally contain saltpeter, it would be good to administer a small quantity of salt or saltpeter, or to give it a watering of liquid manure.

The covering with soil should not exceed more than an inch in depth, and be pressed strongly so as to adhere firmly; watering should only be done when the soil becomes very dry. Where a covering has been removed for some purpose it must be replaced at once.

A few weeks after, according to the state of temperature, more or less, the Mushrooms will appear. In gathering them care should be taken to fill the empty spaces with the same soil as used for the covering. Leaving the bed to itself, it will produce from two to three mouths; but its fertility may be prolonged by careful waterings at a temperature of 68° to 86° Fahr., with an admixture of guano or saltpeter.

By establishing under cover three or four beds annually in succession, a continued supply may be reckoned upon; besides, during the summer months, beds may be raised out-of-doors at very little expense, securing an abundant supply. Frames in which vegetables are forced may in the intervals be used for Mushroom culture with very good results, providing the temperature be congenial, and that the young Mushrooms are slightly protected with soil as soon as they appear.

The Fruit Garden.

SEASONABLE HINTS.

During the past month some of our readers have, no doubt, reveled in the enjoyment of an abundance of Strawberries, and have ample reasons to be satisfied with their well-cared-for Strawberry beds; a largo number, however, we fear, have fared scantily, and are now meditating how best to avoid a similar deficiency another season. We have written about this subject repeatedly, and should not recur to it again had we not several inquiries about it on hand; and as this column is mainly conducted in the interest of beginners, we will tell them how to have plenty of Strawberries next year.

Preparation of the Ground.—As soon as the location of the bed or row has been determined upon, a heavy coat of yard manure—decomposed is best—should be thoroughly incorporated with the soil, by plowing or spreading it under. If the ground is heavy and full of weed seeds, which is unfortunately too frequently the case, it should be turned over again once or twice before planting, loosening and mellowing it at the same time.

Planting in Midsummer.—If the plants to be used are growing on the place, select, if possible, a day when the ground is moist; then with a spade or a large trowel dig out the young plants singly with as much soil attached as can easily be handled; transport to the new location and let the whole clump slide into the holes previously dug for the purpose, fill in the interstices with mellow soil, press firmly, and if dry give a thorough watering. With ordinary care, not a plant in a hundred so transplanted need fail to grow. But when plants have to be procured from a distance, this is not practicable, and ordinary ground-layered plants are at this season so tender and delicate that considerable loss, if not entire failure, results from their use in summer.

Potted Plants come to our aid in this emergency and furnish ready means for planting Strawberries at this season, with hardly any risk of loss. These are simply young plants or runners which, instead of having been permitted to root in the ground, had small flower-pots, filled with soil, placed under them, so that all their roots remain confined within the pot, forming a compact net-work, a ball of roots. About three weeks after the runners have been layered in the pots, they are in the best condition for transplanting. They are then detached from the parent plants, kept in a partly shaded place for a few days, and well supplied with water. When wanted for shipment, they are carefully shaken from the pots, the balls wrapped in papers, and all placed in a box. When received, they should be planted without delay, by digging holes somewhat larger than the ball, sinking this level with the ground, filling in and pressing the soil firmly. If the roots are found to be much netted, it is best to break the ball before planting, by crushing it with the hand. In very dry weather, they should be watered until well established. Good potted plants set out in the latter part of this month, and properly cared for, will produce an abundant crop next year, provided all runners are promptly cut off before they have taken root.

SUMMER PRUNING FOR FRUIT TREES.

There is a great tendency for sap to force itself to the topmost branches of a tree, which induces a rank growth of tender, watery shoots from these topmost boughs. Unless this is checked, the growth is mainly upward, and the largest share of the nourishment of the tree will, of course, go up into this now growth, leaving but a comparatively small amount to develop and ripen the fruit on the lower branches. This tendency is particularly noticeable in the Grape-vine.

Where the vines are allowed to follow their natural inclination they will climb to the tops of the highest trees, perhaps, and all that immense length of stem from the ground to the top but serves as a carrier for the nourishment that is demanded by the top. They may fruit luxuriantly after they have reached the top of their support, but not a branch or a twig, or a bunch of berries will you find on that long stretch of stem. Now, this same vine might have been trained over a six-foot trellis, where it would have borne more and better fruit within easy reach of the grower. If you want small, wild Grapes, let your vines go unpruned, and you will soon have them—by climbing for them. This tendency to upward growth to the loss of the lower branches is more noticeable in the Grape-vine than in the Apple-tree, but it is the nature of all tree growth, and it must be checked, or the rank shoots will surely rot the fruit stems.

The healthy growth of the lower branches and the successful ripening of the fruit depend upon the proper return-flow of the sap from the extremities. Long-continued damp, cloudy, and wet weather will sometimes induce an extra growth of wood that absorbs this sap to the drainage and loss of the fruit clusters. If these shoots are nipped off in the summer, the flow of sap is checked and thrown back to the lower branches. The excessive wood-growth is checked by the same means, and the tree kept in proper form. The tree is kept in a uniformly thrifty condition which will enable it to withstand the severe winter much better than if there were a rank growth in one part, gained through a lack of nourishment and consequent vitality of another part.

Early summer is the most effective time of all the year for pruning. The immediate fruit crop may be increased and improved, and the tree kept in a uniformly thrifty condition. This slashing out of large limbs in the fall and winter is not the thing to my mind. Where a limb is cut off *before* the sap goes up, the rising sap will cause a number of shoots to spring out around the end—just like root sprouts that come up around the stump of a tree that has been felled in winter; but if pruned *after* the leaves are out, such growth will not occur.

I do not believe in severe pruning at any time, but I believe in pruning a little every year, so that excessive pruning will not seem necessary. The pruning should never be allowed to get beyond the reach of the jack-knife. When I see a man sawing and chipping out the top of a tree I know that the pruning fever strikes him about once in every decade. Such pruning is worse than no pruning.

Some follow the practice of pruning every fall, and I have often wondered how they could fail to see the absurdity of producing such an over-growth in the summer, just for

the sake of cutting it away in the fall. The only way that we can avoid this waste of wood and hacking of trees is by judicious summer pruning.

After a fruit tree has attained a good fair size and form, all further wood growth should be discouraged by nipping back the most forward shoots, especially those that are pushing out from the top.

W. D. BOYNTON.

MAKING APPLE-TREES BEAR EVERY YEAR.

In many parts of the country, Apple-trees yield a crop of fruit only every alternate year, the year represented by an odd number, (1879) being barren, while that represented by an even number (1880) will be fruitful. In other places, orchards bear every year. Some trees will yield fruit only every other year, while others near them, on every side, will produce a bountiful crop.

Two seasons are required to produce a crop of Apples, that is, during one season the fruit-buds are developed, and during the next, the fruit. All the vital energies of some trees are employed, during one season, to develop the fruit-buds; then the year following, their entire vitality seems to be spent in developing the fruit, without sufficient force being left to form fruit-buds for the crop of the next season.

Now, in order to induce an Apple-tree to bear every season, climb into the top, or go up on ladders, just as one does when picking the ripe fruit, and with a pair of sharp shears clip off all the young fruit from about half the tree. Then fruit-buds will form on that side of the tree from which the young Apples were cut off. One-half the top, then, will bear fruit one year, while the other half will yield fruit the next season.

S. E. T.

REMEDY FOR CRACKED PEARS.

If any one has a Pear-tree that bears spotted or cracked fruit, says Croppie, in the *New-York Tribune*, let him sprinkle wood ashes freely over the soil beneath the tree, as far in diameter as the branches extend—not a light sprinkle, either, but a liberal dressing. Then wash the bark thoroughly with strong soap-suds (old-fashioned soft-soap preferred), with the addition of lime-water, and a little flour of sulphur. I had a white Doyenne Pear-tree treated in this way, that previously bore only imperfect fruit, but which after treatment gave some delicious highly colored specimens. It may not cure in every case, but it will do no harm.

HARDY BLACKBERRIES AND RASPBERRIES.

Charles A. Green, editor of *Green's Fruit Grower*, found on his fruit farm, near Rochester, N. Y., that, among Blackberries, Stone's Hardy is the hardiest; Snyder next, Taylor and Wallace next, Agawam next, Wachusett next, then Kittatinny and Lawton, down to Brunton's Early, Early Harvest, and Crystal White, the last five down to the snow line, except where protected by the timber. Stone's Hardy, Snyder, Taylor, and Wallace are all hardy enough for this locality. Wallace is the largest and best in quality of the hardy Blackberries.

Among Red Raspberries, Marlboro, Cuthbert, Turner, and Lost Rubies are hardy with him. Shaffer has suffered some for the first time, yet it stands the winter in Iowa.

NECTARINES.

Nectarines require about the same culture and general management as Peaches. The principal difference between them is that the former are entirely smooth, as much so as Plums. The greatest difficulty about their cultivation is that they are so peculiarly liable to the attacks of the curculio, and unless one is willing to give unremitting attention to them during the season this pest abounds, it is useless to attempt the cultivation of Nectarines.

But the greatest value of this fruit consists in its adaptation for forcing under glass; and for training in espaliers on the back wall of cold graperies, it is specially suited. For growing in pots the Nectarine is a great favorite, as it will bear very young. If properly managed, a tree growing in a twelve or fifteen inch pot will, when three years old, produce several dozens of fruit. For a dinner-table decoration, nothing prettier and more appropriate can be imagined than such a tree in full bearing, its branches bending low under their weight of luscious fruit, and inviting the guests to help themselves to the tempting dessert thus offered.

MARKETING FRUITS

The marketing of a crop is just as important a matter as the production of it. As profit is the margin between cost of production and sum obtained, smallness of sum realized will reduce profit as effectually as largeness of cost of production. The farmer and stock-raiser know this, and take advantage of means to increase the salability of their products; but I find that too often the fruit-grower overlooks this important point.

The fruit-grower labors under this disadvantage: He must, to a considerable extent, create a demand, a market, for his product; that is, often to realize a profitable price in a sure market, he must establish for his fruits a reputation that will create a demand for them among consumers. In establishing this reputation, the first point to be observed is perfect honesty in packing. The measures must be of full size. A quart must be two full pints, and a peck eight such quarts. Boxes must not have deceitful bottoms, or barrels be two inches short or without bulge. Then the fruit must be honestly packed in these honest measures. By no means allow the nicest to

shake to the top. Let the fruit be uniform throughout.

For this reason, Peaches, Pears, Apples, etc., should be assorted. The small ones will bring as high a price as the mixed lot, while the large ones will bring a higher price. Care must be taken in picking and handling all fruits easily bruised, as wherever they are bruised they will rot, and then rot all in contact with them.

When you have thus carefully handled your fruit, and have honestly packed it in honest measures, put your name and address

sources; therefore, they will want to buy your entire lot. But if you have consigned to half a dozen different men, you will be made to compete with yourself; for the buyer will so manage matters as to bring all down to the lowest price of any. If you consign to but one man, and he knows it, he will hold your fruit at a stiff price; for he knows the buyer cannot purchase it at a less price elsewhere.

For the same reason, association of the fruit-growers of a neighborhood is beneficial to all; for the fruit of a neighborhood will grade evenly, and if all the fruit-growers in one neighborhood will combine to establish a good reputation for their collective production, and ship to but one commission merchant, they will realize a higher price than they would otherwise do. They will also get better facilities and rates for transportation, for the railroads give better rates to large shippers than to small ones; and all taken from the cost of transportation is so much added to the profits.

While it is dishonest to hide the defects in fruits by putting only the best where they can be seen, it is perfectly right to better the appearance of fruit and make it as attractive as possible. Retail buyers look more at the outside of the fruit than the inside; that is, they consider appearance always, but rarely quality. Of course, those who buy to sell to them must do the same. Fruit-growers could learn a valuable lesson of the fruit-stand keepers on the street corners of our cities. As they open up their stands in the morning, they rub every Apple and Pear till it glistens. Send your fruit to market clean and in clean packages. Little items which I dare not take space to mention, but which will occur to your mind, add to the attractiveness of fruit and enhance its price.

THE NECTARINE.

upon every package in bold-face type. If you are ashamed to own the packages, you would better quit fruit-raising; you will never establish a profitable market. But with your name on the right sort of a package, holding the right sort of fruit, you will; for consumers will want what you have, and know where to get it.

Do not consign to half a dozen different commission men. Buyers want fruit always of an even grade with which to fill their contracts; your fruit will grade more evenly than a combination from half a dozen different

Even the color of the netting used to cover berries should be considered; have it of a color complementary to that of the fruit. Boxes and crates should be neat and clean.

Packages should be of as good material as can be afforded. They should be firm, that the fruit may not be bruised in transportation. The bottom should be thick enough to make the package solid.

Fruit should be picked as soon as in marketable condition. Every day's delay after this period diminishes its value.

JOHN M. STAHL.

The Flower Garden.

MIDSUMMER.

BY JOHN G. WHITTIER.

Around this lovely valley rise
The purple hills of Paradise;
Oh, softly on yon bank of haze
Her rosy face the summer lays!
Bealmed along the summer sky
The argosies of cleud-land lie,
Whose shores, with many a shining rift,
Far off their pearl-white peaks uplift.

Through all the long midsummer day
The meadow sides are sweet with hay;
I seek the coolest sheltered seat
Just where the field and forest meet—
Where grow the Pine-trees, tall and bland,
The ancient Oaks, anstore and grand,
And fringing roots and pebbles fret
The ripples of the rivulet.

I watch the mowers as they go
Through the tall grass a white-sleeved row;
With evon strokes their scythes they swing,
In tune their merry whetstones ring;
Behind, the nimble youngsters run,
And tess the thick swathes in the sun;
The cattle graze—while warm and still
Slope the broad pastures, basks the hill;
And bright when summer breezes break
The green Wheat crinkles like a lako.

The butterfly and bumble-bee
Come to the pleasant woods with me;
Quickly before me runs the quail,
Tho chickens sulk behind the rail,
High up the lone wood-pigeon sits,
And the woodpecker pecks and flits;
Sweet woodland music sinks and swells,
The brooklet rings its tinkling bells.

The swarming insects drone and hum,
The partridge beats his throbbing drum;
The squirrel leaps along the boughs,
And chatters in his leafy house;
The oriole flashes by—and look
Into the mirror of the brook
Where the vain bluebird trims his coat,
Two tiny feathers fall and float.

As silently, as tenderly,
The dawn of peace descends on me;
Oh, this is peace!—I have no need
Of friend to talk, of book to read;
A dear companion here abides,
Close to my thrilling heart he hides;
The hely silence is his voice;
I lie, and listen, and rejoice.

SEASONABLE HINTS.

Although the principal work of sowing and planting in the flower garden is finished at this season, there are many annuals that may still be sown to good advantage. Mignonette, Sweet Alyssum, Candytuft, and many others sown now in good mellow soil, and watered in dry weather, will give an abundance of flowers all through autumn.

Bedding Plants of various kinds may also still be planted, and will, where circumstances have not permitted earlier planting, richly repay the trouble and expense. One of the most pleasing and effective Ribbon Beds we have ever seen for the outlay was planted on the fifth of July.

The center consisted of seven Cannas, the circle surrounding these of six *Salvia splendens*. Then followed twelve *Coleus Verschaffeltii*, then twenty-four Scarlet Geraniums, edged by the outer ring of forty-eight Alternantheras. The ground was, of course, in the best condition; but all autumn the brilliant *Salvias* formed a striking contrast against the rich green foliage of the Cannas, and the Geraniums harmonized pleasingly with the *Coleus* and Alternantheras.

CANNAS.

These plants derive their popular name of Indian Shot from the hard, round, black seeds of the typical species *Canna Indica*. As both the scientific and the common name show, it is a native of India, but has for many years been naturalized in all tropical countries. In Brazil far up the Amazon valley, we found deep in the woods a large field of this plant. Though far from any house it probably marked the place of an abandoned garden; but the strange thing was that, although we searched for it, we never saw a plant in any garden within a hundred miles of the spot.

This plant is now seldom grown as it has been supplanted by more showy species. A few years ago, with the growing taste of sub-tropical gardening, Cannas became very popular and many new species were disseminated. Their easy culture and rapid growth commended them, and the size and rich, varied luxuriance of their foliage caused them to be

CLUMP OF CANNA

planted wherever masses of effective foliage were required.

They are all easily raised from seed, which germinates soon if sowed previous to planting or if sown in a brisk hot-bed. If sown in the open borders the seed lies long in the ground, and the plant has time to make but little growth before autumn. As soon as the plants are two inches high, if the weather is warm, say about the first of June, plant them in the positions they are to occupy. Let the soil be very rich—it can hardly be too rich—and let the situation be where the roots will not dry. Water may be given freely and liquid manure is beneficial. The plants thus treated will grow rapidly, and soon be effective.

But it is not from seed that the superb masses of foliage which one sees in gardens are produced. The Cannas form huge thick root stocks, and these are taken up when the frost has killed the tops, and kept in a dry, frost-proof cellar until spring. They are planted in a frame or potted, and later are transplanted to the garden where they grow

with wonderful luxuriance. At first Cannas were valued only as foliage plants, but latterly some species which combine noble foliage with showy flowers have been produced.

The latest novelty is *Canna Ehmanni*, a variety of the old, scarce, but very beautiful, *C. iridiflora*. The foliage is broad, rather light-green, and the flowers are rich red, and as large as a *Gladiolus*.

For a choice selection, well contrasted in color, we should select *Bikerelli* with scarlet flowers and brown leaves; *discolor violacea*, very tall with splendid dark foliage, but a shy bloomer; *Rendalleri*, glaucous foliage, large canary-yellow flowers; *Warszewiczii*, dark, striped leaves, red flowers; *Marechal Vaillant*, tall, dark green with orange flowers; *Anneli*, crimson flowers, green leaves; *Sellowii*, scarlet and green; *Depute Hernon*, with orange and yellow flowers. There are many species and a host of seedling varieties, and a large selection both in seeds and roots can be found at seed stores, almost any of which will be worth a place in the garden.

E. S. RAND.

SLUGS IN GARDENS.

Our dry, hot summers are not as genial to the development of these garden pests as the damp atmosphere of England; yet several inquiries from readers of THE AMERICAN GARDEN seem to indicate that they are on the increase in some localities. A subscriber writes: "A slimy, creeping snail is very destructive to my plants; how can I destroy these insects?"

Well, in the first place, a snail is not an insect, but a mollusk; and, in the second, the animals which destroy your plants are, properly speaking, slugs. The garden snails of Europe (*Helix hortensis*) do not exist here. There are a few species of this genus found here in damp woods, but they are never seen in sufficient numbers in our gardens to do any damage. The term snails, as commonly used, comprises all land mollusks with shells or houses; while under slugs are understood all land mollusks without shells.

In English gardens slug-hunting is among the most important routine operations, and a method which is found as satisfactory as any is to go along all the walks of the garden each evening with a bag or bucket full of bran, and place a handful of it on the borders, at every eight or ten feet, in a hoop. Slugs are very fond of bran, and it seems to attract them from all quarters, so that the heaps are soon found covered with them, often a complete mass. Early next morning traverse the same ground with an empty bucket, a dust-pan and small broom, sweeping bran and slugs into this dust-pan and emptying all in the bucket. By the time the circuit has been completed many hundreds, if not thousands, are thus captured. By throwing some salt in the bucket they may be killed in a very short time.

Another plan is to lay Cabbage-leaves, upon which some fresh lard has been spread, near the plants in most danger of the depredations of the slugs. This is done in the evening, and early next morning most of the slugs near by will be found under the leaves. They may then be scraped off and destroyed, and by keeping the leaves in a cool, shady place during the day-time, they may be used for many nights.

THE CORAL PLANT.

Erythrina.

These showy shrubs, although natives of warmer climates than ours, will bloom well if planted outdoors in rich, sunny borders, in early summer, but not before all danger of frost is over.

E. Crista-galli, indigenous to Brazil, is the best known and most beautiful species, and as a specimen plant in a flower-bed or singly for the lawn, it can hardly be excelled. Why this superb plant should not be seen more frequently in private gardens can hardly be accounted for, except that it is an old plant, out of date, one which in the race for novelties has been left behind and forgotten. Its appearance is very distinct, the large coral-red, peculiarly shaped flowers, contrasting sharply with the handsome, glossy leaves, in the axils of which they are produced in great abundance. A large, well-grown specimen is a sight to be remembered.

In our Southern States the plant may be left outdoors during winter, and will not suffer, if light protection is given; but it is very important that the bed should be well drained if the ground is at all of a retentive nature. The soil should be moderately rich and light, although the plant is not very partial to any special soil, provided it is well supplied with water during its season of growth and blossoming. Before sharp frosts occur the entire clump has to be lifted, cut back, and planted in a box or pot large enough not to unduly crowd the roots. They may be wintered with safety in a frost-proof cellar or moderately warm room and come out all right in spring, but care must be taken to keep them only moist enough to prevent them from shriveling. The roots, after having been taken up, may also be preserved by covering them with dry sand, similar to keeping Dahlias.

E. Hendersonii is a variety of recent introduction, which, although its flowers are a little smaller than those of *E. Crista-galli*, blooms more profusely, and has the additional merit of flowering much earlier, and continuing in bloom for a longer period. It seeds freely, and seed sown in heat early in the season will produce flowering plants the same year, so that it may be grown as an annual plant.

GROWING BEAUTIFUL PANSIES.

Much as has been written lately about "how to raise Pansies," but little information is given as to how the very finest flowers and most beautiful colors may be produced. Having had unusually good success with my Pansies, my method may interest some of the readers of THE AMERICAN GARDEN.

I plant the seedlings in ridges about eight inches apart and fill up the trenches with cow manure, made thin enough to run. As soon as the plants commence to make a good growth I construct my watering apparatus. This consists of an old barrel with a false

on more water as the liquid manure is drawn off from below. The cask is placed behind a fence, where it is hidden by shrubbery so as to be in nowise unsightly or objectionable.

When the apparatus is once constructed, there is hardly any labor in its use; it takes care of itself, and to convince any one of its efficiency it only needs a trial. I have no doubt that larger and better Pansies can be raised in this way than in any other, and I certainly led our city in beautiful Pansies, raised from THE AMERICAN GARDEN Premium seed.

SAMUEL DENNY.

VERBENAS.

For low beds on the lawn in front of the sitting-room windows, or near the paths, the Verbena is my favorite flower on account of its profuse blossoming and its brilliance of color. A good bed of Verbenas is a sight worth seeing any time, and has some points of merit superior to a bed of Geraniums. Like the Phlox, the Verbena succeeds better with me in a moderately rich soil than in a very rich one. The former seems to be productive of more flowers, the latter of ranker growth.

Verbenas may easily be raised from seed, but for some reason I have not succeeded in raising fine ones from seed. Most of my seedlings produce mauve and pink flowers, and have a coarse appearance. I prefer to buy my plants of the florist. I set out the plants in the beds as soon as the weather becomes really warm, not before, and peg the branches down by bending little twigs into the shape of a hair-pin, and inserting the ends in the earth over the branch. At each point

roots will soon be found, and new plants can be raised in large quantities by this process.

The new plants will soon begin to bloom, and a plant is never without flowers through the season, if seed is not allowed to form. For every branch cut off, two will start from the axils of the leaves below, and these will soon produce flowers. It is very easy, therefore, to increase the blossoming surface, by cutting the plant in well, from time to time. Removing fading flowers regularly will produce this result, and will also extend its blossoming season far beyond its usual limit.

E. E. REXFORD.

THE CORAL PLANT.

bottom, through which several holes have been bored, nailed about half-way down. At the bottom of the barrel is fastened a short piece of an old bamboo fishing-rod, to which a rubber pipe of the necessary length is attached. The end of this pipe is connected with another and longer piece of fishing-rod, through which holes have been bored so that the liquid drips evenly between the rows of plants. This dripping piece or pipe is placed on two forked sticks and moved from time to time so as to keep up a uniform moisture in the bed. When all is ready, cow manure is placed in the upper part of the barrel, and all filled up with water, pouring

The Window Garden AND GREENHOUSE.

ECONOMICAL PROPAGATION.

I have a greenhouse which is fitted up for helping and forcing early salads and some vegetable plants, as an auxiliary to the hot-beds, to be used during the first months of the year, when hot-beds are hard to manage successfully. Having a love for plants, I naturally made the greenhouse the receptacle for such house-plants as could not find room in the living-room windows, and which would not keep well in the cellar.

Toward spring, the increasing of my stock of common and half-hardy bedding-plants of the varieties most sought after was attempted, and I have, since that time, divided the heat and accommodation of the greenhouse with the best success with both plants and vegetables. During early winter the vegetables occupy most of the room, leaving only a sand-bed over the furnace for cuttings, and the space just beyond for stock-plants and the propagation of cuttings, and for seedlings.

As spring advances, the vegetables give place to the flowers; while, in May and June, all the vegetables are transferred to outdoor culture, and the house is full of plants alone. After the first of July, all the plants left on hand, together with those previously saved for stock-plants, are placed in the open ground.

Geraniums, Heliotropes, Petunias, Fuchsias, Salvias, Verbenas, and Pansies are most in demand, and as they will grow in a low temperature, are found most profitable for an amateur florist. Pansies, Stocks, Phlox, Asters, Marigolds, Nasturtiums, and Petunias I raise from seed early enough to have plants in bloom during May and June. Verbenas I raise from seed in preference to cuttings—buying seed of the choicest kinds only, and from reliable sources.

The seed is sown in December, and comes mostly true to name, and produces much nicer plants for bedding than those raised from cuttings, and the seedlings do not suffer from the green fly in the low temperature, as cuttings do. I force them rapidly into bloom in two-inch pots after the first of April.

Fuchsias I propagate from cuttings taken during the summer months, and rooted in separate pots of earth on the north side of a tight fence. This keeps them shady, and if kept well watered the cuttings will be handsome little plants, ready to be lifted in the pots at the first indication of frost in the fall. Early cuttings in the greenhouse in the fall make little winter growth. The summer-grown ones remain dormant on the benches till forced forward by warm, spring weather.

Heliotrope, carefully lifted and potted in September, will have made a new growth for cuttings about Christmas. When these cuttings are potted off, later on, the top is cut off, which makes the plant branching and stocky, and the cut-off tops may be used for propagation again. Salvias and Petunias, such as I wish to propagate, are preserved by cuttings made before hard frost. The stock-plants I leave to die. Choice double Petunias are saved and perpetuated best in

this way. Geraniums are cut down for cuttings before frost, and the cuttings placed in the greenhouse with those of the Petunias and Salvias. Later, the stock plants are lifted for larger bedding-plants the following year.

The management of cuttings and plants, after they are safe in the greenhouse, may easily be learned by any one who gives his mind to it, and will remember what he learns. But I have generally more pleasure and better success with seedlings than with cuttings of plants which grow readily from seed. It is a very rare occurrence that plants grown from first-class seed do not prove satisfactory.

W. H. BULL.

PERPETUAL PELARGONIUM GRANDIFLORUM.

Among the many classes of pot-plants grown in greenhouses, the Pelargonium tribe does certainly occupy one of the first places, on account of its handsome flowers, as well as the great variety of color. The greatest fault with them, so far, has been that the period of their flowering is so short. This imperfection seems now to have been overcome by Mr. Vanden Hoede, of Lille, who, by artificial crossing of *P. Gloire de Paris* and *Gloire de Crimée*, has obtained a variety which is constantly in bloom.

The flowers are large and of good form, the lower petals light vivid pink, the upper ones darker and spotted deep purple, center white. The foliage is well formed and light green. It is evidently a grand acquisition, competing with the Zonals, with which it is desirable that it should be crossed in the manner Mr. Wills has crossed them with *P. peltatum*. To the intelligent experimenter there is a wide field open in this direction.

JEAN SISLEY, Lyons, France.

STARTING SEEDS.

"When possible to purchase plants from a nurseryman, the amateur will avoid much care and trouble in trying to sprout seeds by getting his garden stock ready started." I don't know where this advice was printed, but it caught my eye in the heap of garden literature on my table as gratefully as if it had suggested buying a music box instead of learning the art of music. Of course, all such hints are proper enough, taken with reserve. If one has little time, and wishes flowers with least effort, or if perennials are wanted to bloom the present year, the nursery florist is one's best friend. But those who garden for the love of it find no plants so priceless as those they have raised from seed sown by their own fingers, watched from the first seed leaf, rejoiced in day by day, guarded, cherished without check into lovely and perfect luxuriance. It is not enough that a plant merely lives and blooms—one can't be satisfied unless it is brought to the highest beauty of which it is capable. And, to secure this, one wants to control every hour and condition of its life.

As for seed, one is much at the mercy of dealers, and it is a thankless undertaking to sow seeds except those obtained from the most reliable sources.

But taking the best seed one can get, the germination needs to be hastened, as far as skill can effect it, for every week and day is a gain in short northern seasons. Soaking softens the shell which the germ has to burst

by force, and soaking in warm water over night on the back of a stove, where it keeps warm, puts common seed in good condition for sowing.

The soil for seed-boxes or beds is pretty sure to be too coarse or too fine; either in lumps which shade and chill the seed, or cramp it when sprouted; or the too careful sower has sifted it till it is like flour, and breaks into a crust which no seed can break. Sifted it should be, but like coarse meal, and more than half sand, which is warm, light, and loose, for the tender plumules to root in.

My seed-boxes, made to answer the purpose of in-door hot-beds, are four inches deep, with cracks or holes bored for drainage in the bottom, over which a scant layer of moss is spread, and an inch or more of soil. This was sifted, mixed with sand, and stored in the shed last fall, where it was thoroughly frozen, the frost glistening through it when brought in lumps into the house. To thaw it, the boxes were set in the oven till the earth came out smoking warm, and drying on the top like furrows in a March wind. In this propitious state, a tablespoonful of bone-dust was forked in with a little hand-fork, the top smoothed and the seed sown, picking the finest on the point of a penknife and sinking it just where it was wanted.

It is not easy sowing wet seed otherwise, and the covering is a nice matter. To sift soil over and then water it will sink and wash part of the seed out of good growing depth, and you cannot sift damp soil. It is easier to press the seed down ever so slightly, and a light hand is needed for this and other operations of gardening, or a jar of the box will make the seed sink enough of themselves.

Pressing the surface with a board or trowel is not necessary; that is only called for in outdoor gardening, to protect seed from the sun or from high winds, which would carry it away. In boxes we can give the seed its mellow soil, its steady heat and moisture, the darkness and shelter it loves. The secret of quick starting is to give seed heat, moisture, and shelter without interruption. In a greenhouse or hot-bed this is easy; but I am writing of the in-door work,—raising plants by hand, one may call it,—which the beginner feels an uncertain essay. The risk and care may be diminished more than half by planting in moist soil, already warm, and keeping it so. But how to keep them so, when boxes over the stove or in a room have a trick of drying up hopelessly when one least expects?

There came a little invention which has made my spring sowing so successful that I am anxious to share the knowledge with others. Thick wrapping-paper was cut two inches wider than the top of each box, on all sides, and folded to fit as closely as the cover of a book, the corners held by a tack driven in each, just so it would hold. This was as good as a hot-bed cover for keeping the seed protected and moist. The boxes were piled on shelves back of the kitchen stove, some set on soap-stones on the top of parlor and cooking stoves to secure under heat, and left to their own devices for three days. Then the tacks were drawn and cover lifted; but the soil being perfectly moist, the paper was fastened down again till the end of the week, when most of the boxes needed a sprinkling.

They were left again to warmth and darkness for the next week, when, on lifting the paper, I found the seedlings had knocked their pretty heads against it. Of course, these ambitious nurslings were to be lifted, to give the rest of the seed which had not sprouted a chance.

For these delicate operations my tools are rather laughable; but I find an old table-knife better than a trowel, while a steel three-tined table-fork for stirring the soil, a cooking-spoon for a shovel, and one tine of a sholl hair-pin four inches long, is the best dibble for lifting and setting seedlings in their third leaf.

The thumb pots were filled with the same sandy soil as the seed-boxes, with a thought more mold in them, and a pinch of lime over the moss below, which kept the drainage open. This lime, under the soil, keeps all my house-plants free from worms. In a hundred pots and boxes, last winter, only three had worms, and those had no lime. But I do not like pots for young seedlings, — they dry too easily, — except for Sweet Peas and choice Nasturtiums. My younglings go in the four-inch box, and are sunk in the soil up to their leaves. Very little loss follows from shriveled roots, because water did not penetrate the soil more than half an inch. The remedy, — or prevention rather, — was setting the box in a pan of water till the soil absorbed moisture from below.

After these daily, or half-daily, sprinklings, another invention has been of much use: Covering the plant-boxes with light manilla paper, oiled with raw linseed oil, tacked high enough to give room for the plants to grow. The oiled paper gives just the right degree of sunlight and heat for the young sprouts, and I never saw seedlings of a finer green than those grown under this paper. It was my own idea to use it; but the practice, I find, was recommended by gardeners a hundred years ago. This cover keeps the little hot-bed very moist, the water standing on the under side of the paper, like dew; but the same care must be given to air the boxes, as in a greenhouse. The oiled paper suits many uses for plants, in screens and shades.

These cares I delight in — the fine, fastidious exactness of the florist's first work; and the time is near for starting delicate greenhouse seeds, which require just such careful handling. The most ardent florist beginner will kill two or three batches of seed learning how to start them, and some seeds are so delicate that the professional florist, even, finds it not easy to start them into growth; but what is learned by experience is remembered. EAST DEDHAM.

THE FLAMINGO PLANT.

Anthurium Scherzerianum.

All the species of *Anthurium* are of striking and brilliant beauty, and as exhibition plants, when well grown, we do not know of anything that attracts more attention. Our illustration shows the general character of the genus, but no one who has not seen vigorous, well-developed specimens can form an idea of their gorgeous appearance.

Anthurium Scherzerianum is probably the best known and easiest cultivated species, and having received lately several inquiries about its treatment, we give the following description and directions, from *Gardening Illustrated*:

Few plants have improved under culture

ANTHURIUM WAROCYGNEUM.

so much as this. It is a native of Guatemala and Costa Rica, growing in moist positions, and bearing very small spathes, or flowers, rarely over one inch long, among the dwarf herbage by which it is surrounded. Indeed, so inconspicuous is the plant in its native habitat, that collectors have passed it time after time, not considering it showy enough to be worth introduction.

Liberal culture has, however, worked wonders, and instead of the little "brick-red" spathes, only an inch in length, accompanied by foliage small in proportion, we now have fine forms bearing spathes from five to eight inches in length, and three to five inches in breadth, the color being of the brightest shining scarlet or vermilion imaginable. Instead of sinking in public estimation, after the manner of many other plants, this has gradually won its way into popular favor, and is now to be found by the dozen in many private gardens, while some of the leading nursery-men have it in stock by the

thousand to meet the ever-increasing demand from amateur cultivators.

PROPAGATION.

One thing likely to make this plant popular amongst small growers and amateurs is the ease with which it is multiplied, either by seed or division. Old and well-established specimens frequently bear abundance of seed without any assistance from the cultivator, and seed so produced rarely fails to germinate freely, sown in shallow, well-drained pans of light, sandy compost. If placed in a close case on a gentle hot-bed, germination will take place much sooner, and the pan should not be disturbed, for the

young plants will continue to make their appearance for a year or two after the seeds are sown. The young seedlings may be removed as they develop themselves, and if pricked off into other pans, or potted singly in small pots, they soon increase in size and vigor.

After fertilization the seeds are at least a year in arriving at maturity, and when ripe, the scarlet berries start from the flower-spike and hang down at the sides. When they are ripe it is best to sow them at once, treating them as above recommended.

The plant can also be propagated by the division of large specimens, or by removing the offsets on small plants, which are somewhat freely produced around the bases of the old stems.

CULTURE.

This plant can be grown by every one who has a warm greenhouse or vinery. It likes a warm temperature and plenty of moisture at the root all the year round. The com-

post best suited to this plant is fibrous peat in lumps as large as pigeon's-eggs, living Sphagnum moss, mixed with broken crocks, leaf-mold, and sufficient coarse, well-washed sand or grit to keep the whole open and porous. The pot must be well drained, and if possible induce the moss to grow freely on the surface of the compost.

In potting take care to elevate the plant well above the rim of the pot, and the addition of a little more compost and moss is desirable, as the plant roots out above the pot. It grows very freely when its requirements are duly attended to, and in the case of vigorous specimens a little stimulant in the way of weak liquid manure is beneficial.

The plant is not subject to many insect pests, but like all other hard-leaved plants, it should be repeatedly sponged with clean water to remove dust and other impurities, while frequent and regular syringings with tepid water promote its healthy growth and vigor.

Lawn and Landscape.

HALF A DOZEN GOOD SHRUBS.

WEIGELIA.

With each returning June a beautiful little *Weigelia rosea* peers out from under a large Norway Spruce in my lawn. It is considerably dwarfed, and from its position one would suppose that it could receive neither rain nor dew sufficient to maintain its position a single year; but it has, nevertheless, for ten or more years expanded its myriads of blossoms, ranging from pale flesh to dark rose, to gladden our sight. The Rose *Weigelia* is undoubtedly the prettiest and most desirable of all flowering shrubs. It is perfectly hardy, and exceeds in profusion and wealth of bloom all others, while its varying color and good foliage give it the appearance of a large bouquet.

GOLDEN SPIRÆA.

Next to the *Weigelia* my favorite is the Golden Spiræa. Its leaves come out early in May, with a bright golden color, which is maintained with a gradual change to lemon, and then light green about the middle of June, when it becomes covered with small, white clusters of blossoms, which are followed by red seed-capsules that entirely cover the bush, and give it a peculiar appearance of its own through the rest of the season. This shrub is a sport from the native *Spiræa opulifolia*, is hardy, and of cleanly habit.

SYRINGA.

The third shrub of my preference is the sweet-scented Philadelphia *Ph. coronaria*, popularly called Syringa, or Mock Orange. There are two distinct varieties, blooming ten days apart, of one of which the young wood is of a red color. It sows its seeds freely, and seedlings varying slightly from the parent are quite common.

Its wealth of white makes the Syringa desirable to plant as a foreground to evergreens, or dark-colored buildings.

RED DOGWOOD.

A fourth shrub that flourishes in any but the very driest soils is the *Cornus sanguinea*. Its stems are a bright scarlet all winter and spring, while its summer dress is pleasing and its habit good. It blooms in June, bearing its blossoms, small corymbs of elder-like flowers, followed by white fruit. The foliage in August is favorite food for a snow-white caterpillar, which is easily destroyed with white hellebore.

PURPLE BARBERRY.

A very unique shrub is the Purple Barberry. It is in habit of growth and general characteristics similar to the common Barberry bush of New England, but its foliage for the first two months after bursting into growth is a deep chocolate purple. It is so singular and attractive in appearance that it has been for several years a special favorite of mine, but this morning I noticed for the first time a disgusting and apparently hopeless disease upon it. Under a microscope of low power the leaves appear dotted here and there with small clusters of a fungus-looking growth, displaying small cups of a bright orange hue. In more advanced stages they cover a space a third of an inch in

diameter, and minute green aphids may be seen around them, and also larvæ, the largest of which are about one thirty-second of an inch in length. The full-grown larvæ are orange colored, while the smaller ones are quite slender and pale green in color. Where the insects are most plentiful the leaves are covered with a mealy powder-like pollen, and a net-work of spider-like webs.

TARTARIAN HONEYSUCKLE.

This is the earliest of all, save the Lilac, to put forth its light-green leaves; its bloom is abundant, and all summer its bright semi-transparent fruit delights the eye.

For a small collection I do not know of anything more desirable than these six shrubs, singly or in groups; and of their proper arrangement and the principles thereof I will write at another time.

L. B. PIERCE.

WALKS AND ROADS.

The guiding principle in locating the position of roads and walks is utility. Nature forms no roads or paths; they are the work of men and animals, and would undoubtedly always proceed in straight lines from point to point if obstructions of various kinds did not interfere and cause deviations. Necessity will, therefore, suggest where and how they should be introduced.

So far as regards roads and walks to and from buildings or prominent points of interest, the object of their introduction is sufficiently apparent; but in arranging or laying out pleasure-grounds and lawns it is too common a practice to introduce walks merely to fill up the ground, under the erroneous idea that it forms a pleasing variety of ornament, or that a walk is in itself a thing of beauty, like a tree, which it is not. These are all very questionable reasons for doing a very absurd thing,—that is, making a walk where it is not needed. A road or walk should always appear to aim for some definite object, or lead as directly as practicable to points of sufficient importance to show their utility.

Unnecessary roads and walks should be carefully avoided; they are expensive, usually, in their construction, if properly made, and require to be kept clean and neat. Nothing looks more woe-begone and poverty-stricken than a weedy, neglected road to a house, or walks through pleasure-grounds or gardens. They detract much from the beauty of the surroundings, no matter how elaborate or intrinsically worthy they may be. An oversupply of roads and walks is always a serious infliction, and their useless introduction is a sure evidence of the work of a novice in landscape gardening.

The endeavor to introduce the beauty of curved lines sometimes prompts to a deviation from the more available direct course, and where it can be done without too great a sacrifice of utility, it is not objectionable, but, on the contrary, adds to the good effect. But walks or roads should never be turned from their obvious direct course without an apparently sufficient reason. A change of level of ground-surface, a tree, or a group of plants, or other similar obstruction, will induce, and seemingly demand, a change of line.

There are many locations where the straight line should be preferred as a matter of taste in design. As a connecting link, or

as defining a point between the strictly architectural lines of a building and the irregular surfaces and outlines of natural objects contiguous to it, a perfectly straight walk is in the best taste, and adds greatly to architectural effect; while, on the other hand, a serpentine or frequently curving walk, following, it may be, all the projecting and receding lines of the ground plan of the building, detracts from both solidity and harmony of effect. So also a walk alongside of a straight boundary fence, especially in limited areas where both the fence and walk are visible at the same time, should not curve until it at least deflects into a course directed from the boundary line; and yet we may occasionally notice a zigzag walk under these circumstances, and so decidedly crooked that one steps first on zig and then on zag in the attempt to walk over the pathway.

Most persons are aware of the great beauty of straight walks, and avenues of trees when properly placed, and for public parks of the lesser order, such as in small squares in cities, they are both effective and convenient, where curving walks would be the reverse. In this case beauty depends upon harmony rather than upon contrast, and, more than either, upon utility. When roads or walks are carried over irregular surfaces, the natural turns and windings necessary to follow an easy grade and keep as closely to the original surface of the ground as possible will usually develop pleasing curves. A little studied attention to this question as to the course of a walk or road will increase the beauty of curving lines by adding to them the factor of utility; deep and expensive cuttings, as well as troublesome embankments, may also be avoided, and easy grades and economical construction be secured.

When it is necessary to branch a secondary road from the main road, it should leave the latter at nearly a right angle, and at the same time it should be somewhat narrower than the principal road, so as to avoid confusion or mistake. Otherwise, the roads leading to the ice-house, the stable, or other out-buildings may be mistaken for the road to the dwelling. All these roads should be made to appear subordinate.

In laying out curving or winding walks or roads it is not always best to follow geometrical rules, or to set the curves out to any regular radius. This plan may occasionally prove perfectly satisfactory on a strictly level surface, but it will have quite an opposite effect where the ground is undulating. The curves, to be pleasing, must be what is known as "eye-sweet"—not too sudden or abrupt—and properly blended at their points of junction.—*Wm. Saunders, before the District of Columbia Horticultural Society.*

MOWING LAWNS.

To maintain a lawn in perfect condition, it must be mowed every week or ten days, but not so close as to lay bare the grass roots. Nothing is so destructive to a good lawn as too close mowing. If the mowing is done regularly at proper time, the clippings need never be removed, except perhaps after the first mowing in spring. In fact, the clippings constitute a valuable fertilizer and mulch, of which the lawn should not be deprived, and rakes do generally more harm than good on a lawn. The best implement for smoothing a lawn is a good roller.

Rural Life.

ENLARGING THE DINING-ROOMS.

In the good old times when the mistress and her daughters did all the housework, there was not the necessity for a room consecrated to ornamental china and fancy cooking that is now felt in all well regulated and high-toned families. Indeed, the clean, bright, open kitchen, with its sanded or polished floor, was a very comfortable and convenient place for the family to assemble, not only for their evening work and amusement, but for their daily bread.

When the mistress retired from the kitchen and gave up its care and management to subordinates, the change in that department is scarcely less than the modification of the style of living throughout the house. From being an inviting place it became an uncomfortable and confused workshop whose appearance and character were highly uncertain.

Generally, the modern dining-room is an apartment devoted to a special purpose. In families where the old fashion of doing her own work is kept up by the mistress it is practicable to use this room even for a sitting room; but if the business of clearing and setting the table is carried on by the ordinary kitchen servant, it must be abandoned by the rest of the family so large a part of the time that it cannot well be made to serve anything else than its own legitimate purpose.

In many houses, especially those that were built several years ago, there was a sort of compromise by making this room very small, barely large enough to contain the table and its row of chairs; consequently, houses otherwise capacious are often found with a dining-room of altogether inadequate dimensions. In houses that are blessed with hospitable intentions this should be at least as large as any other single apartment in the house.

How to get more room is a question more commonly asked in regard to the dining-room than of any other in the house, unless the front hall be excepted. Like the familiar advice concerning the resumption of specie payments, it may be said that the best way to enlarge a dining-room is to enlarge it. If this cannot be done without encroaching upon other rooms of the house which are already small enough, then space must be taken from outside. As tables are arranged in a majority of cases, the first demand is for more length. Many rooms which would be large enough if it were not for a projecting chimney-breast or sideboard, are cramped by these articles so as to be practically of very small size.

Hence, if a recess can be made to contain the sideboard, with space enough around it for the servant who waits upon the table to stand without encroaching upon the room itself, such an addition will add to the capacity of the room just as much as if the whole side were extended, and the saving of cost as well as the improved appearance will be very great. Of course this suggestion is only intended for houses and buildings which feel their limitation in this respect, and there is great satisfaction in treating a defect in such a way as to convert it into an actual advantage.—*The Builder.*

COMPANY IN THE COUNTRY.

A great part of the world lies under the delusion that the only place where people ought to have or desire to have company is in the country. Country teas have come to be proverbial for their abundance. And yet, in many respects, it is much harder to entertain in the country than in the city. Country residents must be thrown on their own resources, and are obliged to rely upon them; and though the results may be most satisfactory, yet the attainment thereto is by no means so easy.

Entertaining in the country is very pleasant, and helps to brighten up life. Why should it be made a burden? There surely is no reason, if the entertainers will only be independent, and instead of trying to imitate the ways of others, would inaugurate ways of their own.

For instance, if you want to give an evening party, why need the supper have the aroma of a restaurant about it, tricked off with Frenchified names not one person in twenty can comprehend? Why send five miles for oysters and ice cream, when Plenty is smiling at your own door, holding out her hands filled with riches a city caterer little dreams of?

Very much depends upon the garniture of the table; and in the country with our wealth of autumn leaves glowing with every hue divine, and our Holly in winter, our bright and varied assortment of berries, from the dusky Sumac to the Bitter-sweet's pale-red and yellow, all are ornamental and effective in dressing a room or table tastefully; to say nothing of summer with its trailing festoons of flowers, its glossy leaves and cool Ferns. Make but use of what is with you and around you, and there will be no room for other adornment.

In the country, fruit parties are always delightful and always acceptable. We can call to mind a really splendid entertainment, where all the long suites of rooms were decorated with fruit in every imaginable way except an ugly one. Peaches and early Apples peeped out from behind clusters of graceful leaves; festoons and piles of Grapes and flowers vied with any ever offered at Ceres' or Flora's shrine in fragrance and beauty. When you have nature, use it; it is before you in the country; when you have art, employ it; it is all you have in the city; but do not banish nature, which you do not understand and know perfectly, to bring in art, which has to be studied or else is ridiculous.

Unexpected visitors are easily compared with those who set the time and do not come. The carriage meets the train at four precisely. The man has been taken out of the field to harness up and drive, only to find the labor in vain, and another afternoon has to be wasted on a similar errand. How a little consideration would obviate all this trouble! If any one makes an engagement to visit the country, and expects to be met at cars or steam-boat, it ought to be a settled rule that nothing but illness should prevent that engagement from being kept.

The "spare room" has been set in order, other friends have been put off, the bountiful tea or the late dinner has been set to suit your hour. Everybody has dress and face all fixed for a welcome. How disappointing to see the carriage return empty, with no happy face beaming out a pleasant return for

the vociferous welcome of the children and dogs! Perhaps the next day will not be so propitious; the man of the house may be cross, the horses lame, the harness out of order, or else some one else has "stepped in before you." A friend is twice welcome who comes promptly. But how few think so! Many fancy they are conferring a wonderful favor by bestowing their society at all where else they fancy it must be so lonesome, and who take it for granted that horses and men must be always ready at the disposal of every visitor who designs to relieve such tediousness.

Another hint to those who visit in the country. Do not fancy that you will find everything so very rustic that you can leave all your good gowns at home, and embrace the occasion for wearing out all the old-fashioned ones that chance to be left of last year's wear, too often in a sadly dilapidated condition.

It is very well to have one stout "mountain" or "sea-side" dress, but have also something tasteful and new in case you are invited out, that you may not mortify your hosts; for be sure country people knew just as much about good apparel as others; and even if it were not so it is by no means flattering to be reminded of their deficiencies by the display of a shabby wardrobe. In fact, few can appreciate the latest fashions or the newest styles, or the pretty, dainty little touches that finish off dress more than those to whom they come with the freshness of novelty; and although we ought not always to be judged by our dress, yet that is almost the only way in which strangers can judge; and a neat, genteel appearance goes far toward winning favor in the eyes of our friends' acquaintances. A young lady of style at home would hardly wish, when she visits abroad, to have the remark made: "Who was that dowdy girl in Jones' pew?" or, "A pretty face, only how forlorn she looked when I met her at Mrs. E's party."

Now as to having friends as guests. It is often made a task where it might be a pleasure, because, instead of letting them slide into your ways, you try to fashion your domestic arrangements to theirs.

Instead of letting all the wheels of life stand still in consequence of company, let the company, no matter who they are, see that you are by no means to be defrauded of your household engagements by their presence, and by and by they will enjoy a little ramble alone, or a book on a sunny piazza, until you are at leisure to join them, or else will gladly go the rounds with you, cutting the flowers, training the plants, inspecting the poultry yard, the kitchen garden, or even dispensing the stores from the store-room.

Time then will pass easily and agreeably. Although there are many inconveniences attending company in the country, still they need not be increased by useless care and foolish ambitions. Few people but feel the tacit compliment of being made for the time being one of the family, and happy in being sharers in all that is going on. The very dogs instinctively know such guests, and enjoy their society full as much as do their masters, and indeed in the country your dogs and birds and cats do their full share toward entertaining your friends, and making them feel at home. As for the children, they dote on them.—*Harper's Bazar.*

Foreign Gardening.

HORTICULTURE IN RUSSIA.

The International Exhibition of the Imperial Society of Horticulture, which was held in St. Petersburg from May 17th to 28th, shows what high degree of development horticulture has already attained in Russia.

The interior of the building in which it was held, writes a special correspondent of the *Gardener's Chronicle*, is oblong, about three hundred paces long, and about sixty-six paces in breadth, and upon this unpromising dead level and rigidly restricted space has been formed a scene which, for effectiveness and splendor, surpasses all expectation. From the Botanic Garden and from the Imperial Gardens at Gatschina have been brought a number of fine specimens, including many magnificent Palms and Cycads, which form in themselves an exhibition. The building in proportion is not lofty, and by skillful disposition of the plants a happy appearance of breadth has been secured, while it is at the same time completely furnished. The arrangement has been planned and carried out by Dr. Regel, the general director, and he has succeeded well in his evident aim to produce a natural effect, and to avoid all stageness. We can but say that the result entirely repays the pains and trouble that have been taken.

At the end of the building, the principal entrance opens upon an elevated platform, a kind of transverse promenade, prettily screened from the grand display by an ornamental colonnade, covered with Ivy, and from this position we get an idea of the general plan. The walls are entirely screened from view by banks of fine-foliaged and flowering plants; between the windows, Evergreens and other tall plants reach to the ceiling, and a walk gracefully curved in conformity with the shape of the central groups gives free circulation around the building, while between the groups there is free communication from side to side. The fine specimens and principal groups are shown to good advantage by undulations of the floor in imitation of a naturally favored garden.

Descending from the entrance platform, we reach the first large group on the lowest level, the next is on higher ground and includes a pond of irregular outline in rugged rock, with a fountain. Further on, the principal walk on the left is carried by a bridge over a rocky ravine which leads to the refreshment department. This bridge is formed of birch timber with its natural bark, and the effect is good. Rocks are cleverly imitated on a basis of wood by means of Russian mats; they are laid in the form desired, and then covered with plaster, which is colored in imitation of nature.

Passing the bridge, we come into view of an English garden at the further end, which slopes to a rocky background at considerable elevation. Through the center of it, and under a bridge, we pass to a department of implements, pottery, and artificial flowers, with many other miscellaneous exhibits. The English garden is lastingly laid out, though its use is purposely to be exhibited. A rivulet, bordered with Arums and crossed by a bridge, is introduced with very good effect.

From the bridge which crosses the ravine

leading to the implement and miscellaneous department, we have a fine view of the entire scene, and it has a charmingly tropical aspect, enlivened by the passing and repassing of groups of visitors. The exhibits ranging from groups of fine Palms and Cycads, formed for their reception by the liberality of the great establishments already mentioned. Everywhere beneath the plants the ground is surfaced with moss, and tubs necessarily exposed are decorated with sheets of birch bark. The great groups are outlined with strips of thin wood, painted green, and within are the subordinate groups of the collections exhibited.

Judging the exhibits practically occupied the whole of the 16th. The members of the jury, to the number of nearly two hundred, assembled under the presidency of General Greig, and the business of the day was commenced by a religious service, followed by a benediction on the entire exhibition. The jurymen were divided into sixteen sections, each of which elected a president and secretary. On Saturday, the 17th, in the afternoon, the exhibition was opened in full ceremonial by the Emperor and Empress, who were attended by a throng of ambassadors, ministers, generals, and court dignitaries, all in full uniform, and bearing their decorations. There were present the Grand Duke Vladimir, the Grand Duke Nicolas, a patron of the Society, and a number of distinguished ladies.

ORANGE GROWING IN THE WEST INDIES.

It is interesting and astonishing to me, writes "Olive," in *Green's Fruit Grower*, to read how you prepare and manure your land for planting — here in Jamaica we do nothing of the kind. We simply clear away the grass and plants, and the earth quite understands that it is to bring forth abundantly. We don't cultivate our fruits; they grow wild. By growing wild I mean they grow of themselves, anywhere — in grass pieces, it ruminates in old thrown-up negro settlements, on the hills, in savannas, by river sides, and all about.

Our Orange-trees are especially hardy and long-lived; their motto is, "Never say die." All we can do is to keep our pet trees free from wild Pine, Mistletoe, and other parasites, and Nature's beneficent hand does the rest. We don't graft as you do either, which seems a pity, as it would certainly improve our fruit and make it more valuable, particularly as we have so many different kinds of each, especially of the Orange tribe, many of which you have never seen, as they wont bear shipment.

In picking, each Orange is cut from the tree with a small bit of stem adhering. To wrench the fruit from the stem is bad policy, as the air penetrating the unprotected part entails speedy rot to the individual fruit, and consequently damage to the whole barrel. This work is patronized entirely by women and children. Holding her Orange in the left hand, the wrapper envelopes it in a sheet of paper, and with deft twists of the right fingers the business is complete and the fruit is handed up to the person who places it in its proper buyer. This simple process is repeated *ad infinitum* till the Oranges are exhausted. A negro girl can with ease wrap from three to four barrels per day.

I like to read about your nice, cozy homes,

with all the land under your own supervision. Life out here is not cozy at all. People buy or lease great big properties of hundreds and thousands of acres, which require the supervision of the master, the Busha, and various headmen and penners. Of course, we raise a good many cattle and horses, and so require plenty of grazing room; but all the same, tropical life is *not* so cozy as Northern. It is a *lazy* life too; you *live*, we *vegetate*; you rush, while we crawl. As I sit writing, there is not a sound to be heard but the nightingale singing outside and the rustle of the breeze among the canes. Nothing is to be seen but green woods and blue hills; very pretty but monotonous to a native. Jamaica is certainly a splendid place for rest, but — ah well, I mustn't grumble.

JAPANESE FRUITS.

According to Dr. Vidal, in the *Bulletin de la Société d'Acclimatation de Paris*, our fruits are represented in Japan by nearly all the species commonly cultivated in Europe, except the Almond.

The Peach-tree is commonly grown, producing handsome fruit, which is often seen in the markets. Judging from their appearance, the Japanese Peaches should be very good, though perhaps not equal to the Chinese. Unfortunately, however, the Japanese are in the habit of eating their Peaches quite green, and as one cannot procure ripe ones, it is impossible to judge of their quality. It is the same with the Nectarine, the fruit of which is handsome, but gathered much too green.

The Plum is scarcely so common as the preceding; at least as a fruit-tree, being also planted for ornament.

The Cherry is widely diffused, though it produces only very small, inferior fruit, which is eaten neither by the natives nor foreigners. It is generally grown as an ornamental tree, and it also occurs wild.

The Pear is an object of careful culture, after a method peculiarly Japanese. The trees are planted in rows in quincunx order, forming avenues about three yards broad. They are grafted and pruned with great care. Only about four or five principal branches are left, and these are soon stopped, in order to encourage the early growth of the secondary ones, which are trained out horizontally on Bamboos arranged for the purpose, about five feet from the ground. The variety is a winter fruit of considerable size, sometimes very large. It rarely attains perfect ripeness, is rather dry and slightly acid, though occasionally one finds a very good fruit.

The Apple is far from being so common as the Pear, nor is it so carefully cultivated. The sort commonly seen has a small yellowish fruit of agreeable flavor. No regular Apple orchards were observed.

The Quince is very common, especially in the North, and the fruit, which is very fine, is eaten by the natives as we eat Apples and Pears.

The Strawberry and the Raspberry are only seen in the wild state. There are two sorts of Raspberry, one with yellow and the other with red fruit. As for the Strawberries, they are entirely devoid of flavor, and worthless for the table. For some years European varieties have been grown in quantity at the ports frequented by Europeans.

Horticultural Societies.

MASSACHUSETTS HORTICULTURAL SOCIETY.

The grand Roso and Strawberry Exhibition of this society was held on June 24th and 25th, at Horticultural Hall, Boston, and as far as the number and excellence of the exhibits in general beauty and choice of varieties, and especially the arrangement and management of the whole, are concerned, it has probably never been equalled on this continent. The beautiful granite building in the very heart of the city, within a few steps of the Common, is the property of the society, and is admirably arranged for exhibition purposes, occupying an entire square; light is obtained from all sides. The upper hall, in which the flowers were shown, was very tastefully and ingeniously mapped out so as to show each exhibit to the best advantage, and the bird's-eye view of the whole, as seen from the gallery, might without much imagination make one believe to have suddenly become transported into fairy-land. There was nothing of the stiff, monotonous appearance produced by long, narrow, parallel tables; the whole disposition of the tables and stages was so tasteful and natural as to resemble the parterres of a beautiful flower garden, more than an exhibition hall, as usually arranged.

In the center was a very broad table for the Roses competing for the silver "Challenge Vase" of the value of \$200, for twenty-four varieties, three specimens each, to be held by the winner against all comers for three consecutive years, and then to be his property absolutely. The vase was won by John B. Moore & Son, and deservedly so, for a more magnificent display of Roses it has never before been our fortune to see—not one of them that was not perfect. The collection consisted of Abel Carriere, Baroness Rothschild, Charles Lefebvre, Mabel Morrison, Duke of Edinburgh, Francois Michelon, Jean Liabaud, Glory of Cheshunt, Baron de Boustetten, La Rosiere, Etienne Levet, Marie Baumann, Camille Bernadin, Mme. Gabriel Luizet, Marquise de Castellane, Charles Darwin, Crown Prince, Comtesse de Serenye, Maurice Bernadin, Louis Van Houtte, Marguerite de St. Amande, Marchioness of Exeter, Mme. Prosper Langior.

Other tables, containing the exhibits of those competing for the society's regular prizes, were arranged nearer to the platform, while along the walls, just below the large windows, were huge banks of Roses, in bottles, so arranged that nothing but the flowers and their foliage was visible. This arrangement was especially pleasing, the tables so placed as to form alcoves or recesses, and presenting each exhibit to the best possible advantage, and at the same time giving the whole a more varied appearance than could be produced with straight rows of tables.

The special subscription prizes of silver vases for Hybrid Perpetual Roses, twenty-four of different varieties, were awarded to John L. Gardner; second, William Gray, Jr. Six of different varieties, John S. Richards. Twelve of different varieties, William H. Spooner. Eighteen of different varieties, John L. Gardner. Six of any two varieties, three of each, Francois B. Hayes. Eighteen of six varieties, three of each, William H. Spooner. Special prize offered by a member

of the society for the best six blooms of any variety, to be judged by a scale of points, William A. Spooner, for Mme. Gabriel Luizet. The special prizes offered by the society for the best six blooms each of Alfred Colomb, Baroness Rothschild, Jean Liabaud, John Hopper, Marquise de Castellane, and Mme. Victor Verdier, were all taken by John B. Moore & Son; and that for Mme. Gabriel Luizet, by William H. Spooner. The prize for twelve blooms of any other variety was awarded to John B. Moore & Son for Mons. Boneonne, and the first, second, and third, for a single bloom of any variety, to the same for Francois Michelon, Mme. Gabriel Luizet and Alfred Colomb respectively.

Of the society's regular prizes, that for twenty-four varieties of Hybrid Perpetual Rosos, three of each, was awarded to John B. Moore & Son. Twelve varieties, William H. Spooner; second, John L. Gardner; third, Francis B. Hayes. Six varieties, John L. Gardner; second and third, John S. Richards. Three varieties, Francis B. Hayes; second, John S. Richards; third, John L. Gardner. Moss Roses, six named varieties, William H. Spooner; second, John B. Moore & Son. Three varieties, John B. Moore & Son; second, William H. Spooner. General display of one hundred bottles of Hardy Rosos, John B. Moore & Son; second, Norton Brothers; third, John S. Richards; fourth, Francis B. Hayes; fifth, William H. Spooner.

Next to the Rosos, the orchids probably attracted most attention, and here again the variety of curious forms, rich colors, and delicious fragrance was indescribable. The principal exhibitors were F. L. Ames and David Allau, gardener to R. M. Pratt, who together filled the first stand in the upper hall. H. H. Hunnewell had a fine collection on the next table, and all were interspersed and set off with the beautiful foliage of the *Asparagus plumosus*, or of rare and delicate ferns. Mr. Hunnewell had also flowers of the *Dipladenia amabilis*, a rare hot-house plant, and a specimen of the *Nertera depressa*, or Bead plant, looking like a mossy surface thickly strewn with orange-colored beads. Mr. Hunnewell also filled a platform with a collection of greenhouse plants in flower, which received the first prize, and included *Spathyphyllum hybridum*. On this platform was also a remarkably fine *Rhynchospermum jasmoides*, which took the second prize as the best specimen flowering plant; a fine Clerodendron, and several finely bloomed Pelargoniums. On the opposite side of the hall was a platform of plants from John L. Gardner, who took the first prize for a collection of flowering plants, among them a *Rhynchospermum*, which we should think would have puzzled the committee to decide between it and Mr. Hunnewell's. Mr. Gardner took the first prize for a specimen flowering plant with *Erica Bothwelliana*, which we thought the finest heath we have ever seen, though an *Erica ventricosa superba* was more beautiful in flower, but not so large a plant.

A specimen of a double *Deutzia scabra*, a new seedling, originated by John Richardson, was shown, and promises to be an acquisition to our hardy shrubs. J. W. Manning exhibited a large collection of hardy herbaceous plants, comprising fifty species, all carefully named. The display of Sweet Williams was uncommonly fine. Edward W. Bred made a good display of Carnations, and W. C. Strong exhibited a

collection of variegated tree and shrub foliage. On the lower floor were the exhibitions of fruits and vegetables.

The collection of Strawberries was remarkably fine, comprising about one hundred and fifty dishes of fruit, but appearing much larger on account of the berries being shown in single layers on plates made for the purpose. For size the Sharpless took the lead, but it had a powerful competitor in the Belmont, a new seedling of Mr. Warren Heustis, which pleased us very much. It was raised from Sharpless seed five years ago, and has its full-developed character. It is of large size, about that of a medium-sized Sharpless, of peculiar, purse-shaped, attractive form, very uniform, brighter in color than Sharpless, and of much better quality. It is a prolific bearer, and a most vigorous grower. It was without exception the most attractive looking berry on exhibition. Jersey Queen, Manchester, Cumberland Triumph, Bidwell, Hervey Davis, Wilder, Miner, were among the most inviting in appearance.

Black Hamburg Grapes, from the Hon. Francis B. Hayes, the president of the society, were of enormous size and well colored.

Among vegetables, Peas took a leading position, and we have certainly never seen finer dishes anywhere. All the premiums for Peas, regardless of variety, were awarded for American Wonder. Beets, Carrots, Cucumbers, Lettuce, Tomatoes, in fact, every kind of vegetable that can be produced out of doors or under glass at this season, were represented.

We could easily fill many pages in describing all the many floral and other attractions contained in these enchanting halls during these two days, not the least interesting of which were the intelligent and observant visitors, ladies principally, who were as familiar with the qualities and merits of the different varieties as professional florists. The exhibition, as a whole, as well as in its details, was a grand success, well worth a long journey to see; and to any one who wishes to see a real flower show, be it Rosos or Rhododendrons, or anything else, we would say, go to Boston.

THE NEW ORLEANS WORLD'S FAIR.

The Hon. P. J. Berkman, of Augusta, Ga., First Vice-President of the American Pomological Society, sailed for the Old World on the 18th ult., in the capacity of Foreign Commissioner for the Centennial Cotton Exposition, to be held in New Orleans next winter. He will visit first Egypt and other North African States, then the southern countries of Europe, and lastly the middle and northern parts of the continent. His commission comes both from the Exposition authorities, and from the President of the United States, so that he starts equipped with the most favorable facilities.

The managers of the fair are to be congratulated upon having been able to secure the services of a man so excellently fitted for the position. His familiarity with several European languages, his eminent knowledge and experience in pomology and horticultural and agricultural matters in general, combined with hearty geniality and genuine gentility, make him just the man for the place. We wish him all possible success in his undertakings.

Household Pets.

CARE OF BIRDS.

I pity caged birds, yet so many people have and love them that it is often a part of the care of a household to look after its "pets." First on the list is the canary, and we will for a while see what can be done to make its little life happy, and at the same time have all the music we can. The size of the cage makes a great difference in this matter, for the larger the cage, the less music. Your bird will skip about and amuse himself otherwise than with trills. Give him plenty of water to drink, and a daily bath in the full sunshine. But the hen bird must be deprived of the bath-tub while setting. Ornamental brass wire cages are bad; the verdigris is sure to poison the bird. So also are painted cages. Those of white, tinned wire are the best, furnished with two perches, the food and drinking vessels always outside of the cage, the floor movable, and always strewn with coarse sand.

There is a great difference in the disposition of canaries; some are gay and fond of company; others are of a retiring disposition, and, either from vanity or modesty, will not sing a note in the presence of another bird. The food should be summer Rape-seed, and now and then a little Oats or Canary-seed. They are fond of Cabbage-leaf, a bit of Groundsel, or a quarter of an Apple. Avoid sugar or cake, but give a lump of bay salt between the bars. Let the seed be put in fresh every day, so that he will not pick it over and have to eat the refuse if you do not refill the dish until empty. If he is dull and mopeish he may have taken cold or have been frightened. Give him a little magnesia or a drop of castor oil, put down his throat through a quill. After moulting, a canary often loses his voice and requires all the care you would give to a fledgling.

Perhaps your pet is a robin, for he is a cheery house-bird if once domesticated. He should have a large cage, twenty inches long by twelve wide, and the same height. He wants lean meat, fresh, green food, worms, grains of wheat, and ripe berries. The robin is fond of butter, but must not be too much indulged. I quote from an old work on bird diseases and cures, the following:

"Dysentery: Diet of eggs and meal-worms. Cramp: Diet, meal-worms. Giddiness: Administer a green caterpillar. Dullness and melancholy: Chop up a pot marigold in the food. Moulting: Give poppy seed and saffron in the water. Let the robin have plenty of water to drink and bathe in."

Whatever your pet may be, it is well to consider that it will not endure neglect with impunity; that fresh air, pure water, and clean quarters are a necessity, and that all animals know, and fool, and understand a great deal more than we give them credit for, and appreciate kindness almost as much as a human being. They are sensitive to a draught, and suffer in too heated an atmosphere more than from cold. But for all the care required they will repay us with their pretty ways and cheering songs. — *Annie L. Jack, in "Good Cheer."*

Miscellaneous.

A SERMON IN RHYME.

If you have a friend worth loving,
Love him. Yes, and let him know
That you love him ere life's evening
Tinge his brow with sunset glow.
Why should good words no'er be said
Of a friend—till he is dead?

If you hear a song that thrills you,
Sung by any child of song,
Praise it, do not let the singer
Wait deserved praises long.
Why should one who thrills your heart
Lack the joy you may impart?

If you hear a prayer that moves you,
By its humble, pleading tone,
Join it. Do not let the seeker
Bow before his God alone.
Why should not your brother share
The strength of "two or three" in prayer?

If you see the hot tears falling
From a brother's eyes,
Share them. And, by sharing,
Own your kinship with the skies,
Why should any one be glad
When a brother's heart is sad?

If a silvery laugh is rippling
Through the sunshine on his face,
Share it. 'Tis the wise man's saying—
For both grief and joy a place.
There's health and goodness in the mirth
In which an honest laugh has birth.

If your work is made more easy
By a briefly helping hand,
Say so. Speak out brave and truly,
Ere the darkness veil the land.
Should a brother workman dear
Falter for a word of cheer?

Scatter thus your seeds of kindness,
All enriching as you go—
Leave them. Trust the Harvest Giver,
He will make each seed to grow;
So, until its happy end,
Your life shall never lack a friend.

BOB. BURDETTE ON FARMING.

This month is a good time to pay the interest on your mortgage and renew the notes you gave a year ago. It is also a pretty good time to take up the notes you unwittingly gave to the cloth peddler last Christmas under the impression that you were only signing a contract.

Oats thrive best in an elevator. A farmer who has thirty thousand bushels of Oats in an elevator need not worry about the weather. Always raise Oats in a good elevator and keep out of a deal with the Chicago man.

Look after the Bean poles you had left over from last year. You will look a long time before you find any. They have gone, partially into the insatiable maw of the all-devouring fire-place, and neighbors have stolen the rest.

Raise chickens. If you have a nice little garden, by all means raise chickens. Your neighbor's hens are the best ones to raise. You will find them, from 5.30 A. M. until 6.20 P. M., on your Lettuce, Onion, Radish, and flower beds. You can raise them higher with a shot-gun than anything else. N. B. Always eat the hen you raise. P. S. Cook the hen before eating. P. S. S. Before outing the hen, shut it.

Crush egg-shells and feed them to your own chickens, if you are foolish enough to keep any. If the whites and yolks are re-

moved from the shells first, they will crush more easily.

If a good horse shows symptoms of going blind, and is developing a few first-class spavins, it is time to sell him. Sell him out of the county, if possible. Beware of the deacon who has a little blaze-faced "pacin' mare" he wants to trade for "just such a boss."

Eternal vigilance is the price of the Potato crop. About ten hours a day, devoted to crushing Potato bugs with hard sticks, will probably save the upper part of the patch for you. By the time you dig the Potatoes, you will be so disgusted with everything pertaining to Potato culture that you couldn't look a Potato in the eye without a feeling of nausea, and as for eating one—but this enables you to sell the whole bushel without a pang.

Young hens lay more eggs than old ones. This is because the giddy young things have not yet learned their value. In a few years they know just how to stand around on a strike when eggs are \$1.75 a dozen, and then rush out and work double time when eggs are so common the tramps won't eat them.

MUMMY GARLANDS.

Dr. G. Schweinfurth gives in *Nature* an account of some new botanical discoveries made by him in connection with the mummies of the twenty-first Egyptian dynasty, found at Der-el-Bahan. In the floral wreath on the mummy of the princess Ugi-Khoni were found perfect flowers of the Corn-poppy (*Papaver Rhoeas, var. genuina*) which appear to have been gathered in an unopened condition, to prevent the petals from falling, and are in so good condition that so perfect and well-preserved specimens of this fragile flower are rarely to be met with in herbaria. It is worthy to note too that the character of this variety of the Poppy, as well as of the other plants employed, although gathered more than three thousand years ago, is identical with the same plants known at the present day.

CEMENT FOR MOUNTING PLANTS.

Take of bisulphide of carbon any quantity desired, and dissolve therein a sufficient quantity of crude India-rubber to make a cement of the proper consistency. This, says Mr. J. H. Pystor, in the *Torrey Botanical Club Bulletin*, is the best compound that can be made for the purpose of mounting plants, as well as for use where a strong cement is desired.

THE WORLD'S SUGAR PRODUCTION.

The total world's production of Sugar from various sources is, according to the *American Grocer*, estimated by reliable authority at not less than 5,000,000 tons. Of this total supply, the United States and Great Britain consume over 2,000,000 tons. The importance of this crop, commercially, may be realized if we estimate it at the low price of \$65 per ton, or \$325,000,000 for the whole crop. This estimate is exclusive of the Sugar consumed in India, which, according to many, produces fully one-half of the Sugar produced in the world. However, 2,260,000 tons, nearly one-half of the exportable crop, is produced from Beets in Europe.

DINING À LA MEXICANA.

TABLE MANNERS, FOOD, AND CIGARETTE SMOKING.

I invite you to dine with me to-day, dear friends, à la Mexicana. As I am myself a guest, we must touch the subject tenderly, and while the truth may be told at all times, we would not abuse the generous hospitality shown us on every hand by indulging in invidious comparisons. In a spirit of mutual good-feeling then, remembering that the habits of all lands vary, let us repair to the dining-room. The words "*vamos á comer*" (let us go to dinner) are welcome ones, for in Mexico we do not breakfast American fashion, but take only a small cup of chocolate and a tiny loaf of Mexican bread, without butter or other accompaniment, immediately on arising. Therefore, by 1 P. M., our healthy appetites are "sharp set" enough to do justice to any dishes, however unguessable their ingredients may be.

The comedor, unlike other rooms in the house, is seldom paved or cemented (wood floors there are none in Mexico), but has simply mother earth for a cheap and convenient carpet. Much sweeping and shoving about of chairs has worn this dirt floor into hollows and gulleys. It being a few inches below the level of the court, when brief rains fall in torrents, as is common in this latitude, a small flood pours in and makes little lakes in the hollows aforesaid, which the servants bail out with plates.

In rather incongruous contrast to the earthy floor is the handsome mahogany side-board, with much glass-ware shining upon it, some distracting pieces of old blue china, and quaint articles and Guadalajara pottery in the way of water-jars, which we long to possess. Wash-stands, with bowl and towel accompaniments, adorn the corners, the convenience of which is apparent, there being no other finger-bowls. The most distinguished guest is given the post of honor at the head of the table, in the chair of state, which is a few inches higher than the rest; other guests are ranged at his right and left, and host and hostess seat themselves wherever it happens. When we enter there is nothing upon the festive board but a heap of knives, forks, and spoons, a pile of plates, and a cluster of goblets, all at the foot of the table where the head waiter stands. Among the better classes the dinner of every day is always a most ceremonious affair, each dish being served in a separate course, necessitating a great number of plates to each person. There is little variation in the bill of fare, one dinner being an almost exact counterpart of all others during the year.

As the servants emerge from among the flowers of the sunny court, bearing our ambrosia, we think of fairy tales and the Arabian Nights—only these creados do not much resemble orthodox fairies, nor is the food they bring exactly the ambrosia of our imagination. If the waiter be a woman, her head and shoulders are always closely wrapped in her rebosa; but if a man, he wears only shirt and breeches and his wide old sombrero. First, broth is served in small china tea-cups, each cup covered with a hot tortilla (griddle-cakes of crushed corn and water, pronounced *tor-tee-yah*), the cup set upon a plate which holds also a large brass spoon. Mexicans have an inordinate fondness for fat of all kinds, a passion for chili,

and consider onions as much a necessity of life as we do salt; hence this broth, and every other dish for that matter, is always very greasy, very garlicky, and red-hot with chili pepper. If there happens to be any ripe fruit in the house, notably Grapes, it is put into the broth and eaten with it. The other day, my delighted eyes beheld some luscious-looking Peaches being carried into the comedor, and I hastened to dinner in blissful anticipation of once more being permitted to gaze upon something like home food. But what do you suppose was done with those big, yellow Peaches? They were sliced, every one, into the greasy, garlicky broth.

The second course is *sopa*—either rice, vermicelli, or macaroui, slightly boiled and then fried in fat with much garlic, and garnished with slices of green peppers. With it goat's-milk cheese is served, most persons crumbling the cheese into it, and eating the exceedingly greasy mixture with a spoon. Then comes the main dish, which never varies—the same at three hundred and sixty-five dinners in the year, throughout a Mexican's natural life—viz., boiled beef or mutton, with cabbage, corn, onions, small green apples, pears, or quinces, with various tropical seeds, roots, and bulbs, all boiled together in one pot. It is served with much chili in some shape—generally in the form of salad with *ahuacates*, to which "five" coals would be a mild comparison. The amount of chili which the smallest children devour as calmly as ours do caudly is something astonishing, and inclines one to the belief that the Mexican "inner man" is copper-lined and double-plated. The nearest approach to roast meat comes in the fourth course,—a piece of pork or kid, stuffed with spices, herbs, chili, and chopped onions, and "boiled down" in the pot till the surface is slightly browned. What we consider a roast is no more obtainable in the Mexican market than a beef-steak.

Then follows a variety of entrées, each a separate course,—such as *chili-con-carne*, meat cut into bits and boiled with fat, tomatoes, and chili; large green peppers stuffed with chopped pork and onions, and fried in batter; pork hashed with onions, cheese, and scrambled egg; sour milk, or cheese, boiled in lumps with chili; tortillas spread with minced meat, onions, and chili, rolled up and served with tomato sauce, etc. The last dish, both for dinner and supper, is invariably the same in every Mexican household, high and low, rich and poor—that is, stewed frejoles (red beans). The laws of Medes and Persians may change, and death and taxes sometimes be evaded, but this national custom of "topping off" with frejoles—never! Some pour molasses over their beans, others prefer them mixed with sour milk, and others take them "straight," to which latter number, though it be in the minority, your correspondent belongs. To neglect to eat frejoles after each meal is not only a breach of etiquette, but is considered indubitable evidence of bad breeding and execrable taste.

We have always native wine or imported claret at dinner, and at intervals during the repast tortillas are served, smoking hot from the griddle. The latter are not brought in on plates as we serve cakes, but the servant puts them in a pile on the table-cloth, beside the host or hostess, who distributes them

around to the guests with a dexterous toss, precisely like dealing cards at the innocent game of "casino." If bread is used, it is laid in the loaf on the cloth, and when one wishes a piece he cuts to suit himself. After frejoles we sometimes have fruit or "dulce" (jelly or marmalade), but generally no dessert but the beans; and the repast is concluded with cups of strong, black, bitter Mexican coffee, with sugar if desired, but no milk. This ceremonious meal requires much time, but nobody is ever in a hurry in Mexico. If the servants are tardy between courses, and keep you waiting a quarter of an hour or more while somebody leisurely rambles to market for a forgotten article, mine host is not in the least disturbed thereby, for conversation never flags, and there is nothing to do after dinner but to take a long siesta.

During eight months' residence in Mexico I have not seen a bit of butter, a potato, an egg, cooked by itself, chop or steak, tea, sauce, cake, pie or pudding, or those common vegetables which we consider indispensable. Napkins are rarely used, each person wiping his or her face and hands on that portion of the table-cloth which happens to be nearest, and afterward patronizing one of the before-mentioned corner wash-stands. Eating with the fork is not at all according to etiquette, but the spoon or knife must be used, or, more properly, a tortilla. Mexicans manage the latter with as much dexterity as a Chinese does his chop-sticks, curving it between the fingers till it forms something like a spoon, and scooping up the food with it, eating spoon and all. The very old people, and the lower classes, use tortillas altogether instead of knives, forks, or spoons, the latter "new-fangled notions" being of comparatively recent introduction. It requires considerable practice to successfully manage the tortilla scoop, as I have learned from sad experience.

After the banquet is ended, and at intervals during its progress, if one feels so inclined, the mouth is filled with water from the goblet, rinsed with more or less emphasis between the teeth, and then the water is squirted upon the floor. In this process all become expert, from the lady of the house to the smallest child. When fresher water is required, that in the glasses is carelessly tossed upon the dirt floor, where it can do no harm. While waiting for coffee, and afterward, during pauses in the "feast of reason and flow of soul," the gentlemen of the family, and not infrequently the ladies also, settle gracefully back in their chairs and smoke a cigarette or two.

In a Mexican household, at five o'clock P. M., we have always chocolate or coffee, served with bread as at breakfast, or with little cakes resembling sweetened crackers, or *pan-de-pulque*, biscuits made with the national intoxicating beverage, distilled from the century plant. Later in the evening, at any hour from nine o'clock till midnight, comes the supper, which is almost as ceremonious a repast as the dinner, and its counterpart as to menu, minus only the broth and boiled meat. Everybody goes straight to bed from the supper-table, and what with hearty food at unreasonable hours and the eternal grease, garlic, and chili, the wonder grows that the nation did not die out long ago of dyspepsia.—*Fannie Brigham Ward, in Springfield Republican.*

Obituary.

MARSHALL P. WILDER, JR.

With deep regret we record the death of Marshall P. Wilder, Jr., son of the Hon. Marshall P. Wilder, the venerable president of the American Pomological Society. He died at his father's residence in Dorchester, Boston, on the 7th of June. For more than a year his health had been gradually declining. It was hoped a winter's residence in Colorado would restore his waning strength, but he returned in April only to pass away in the midst of a large circle of relatives and friends. He was a man of unusual abilities, and seems to have inherited a large share of the noble, manly, and Christian qualities which have made his father renowned throughout the civilized world.

His death is the more to be deplored, as, bearing his father's full name, he was expected to succeed to the parental homestead with its famous gardens and orchards, where for half a century some of the most valuable and important achievements in American horticulture were accomplished, and where the original specimens with which his father made the first experiments in hybridization are still preserved. Its disintegration would be a national loss.

But, great as young Wilder's loss is to the interests of horticulture, it is small compared with the grief and disappointment it brings to his aged parents and their immediate family. From such a home as his has been, where mutual respect and esteem animate every one of its members; where every action, every thought, betokens generosity of heart and unselfish devotion; where every breeze that rustles through the noble Beeches that shade its porticoes seems almost to be fragrant with sentiments of love, no one can easily be missed.

To his honored and beloved father, may the consciousness of his own grand and successful life, his many worthy deeds, and the love and devotion of his noble wife and his remaining children,—to all of whom we tender our sincere and heartfelt sympathy,—offer some consolation for his painful and irreparable loss.

OUR BOOK TABLE.

Summit County (Ohio) Horticultural Society.—Annual Report, giving the papers read and the discussion thereon at the monthly meetings of this flourishing society. Several of the essays are replete with valuable and interesting information. The secretary, Mr. L. B. Pierce, and other prominent members, are regular contributors to our columns.

The "Continent" Campaign Memorandum Book, published by the *Continent Magazine*, 25 Clinton Place, New-York. Every sensible man needs some convenient method of keeping brief memoranda of political events during a presidential campaign. This little book is designed for that very purpose. It contains a list of all the Delegates to the Republican Convention at Chicago, arranged by States, and is conveniently arranged for entering the dates of canvasses, meetings, time of registration, and other things that one should keep a record of pertaining to the campaign.

"Outing" for July comes along with the breath of the hills and the scent of summer

flowers in it. The first article is an illustrated description of the Catskills, where one can still evidently find nature at her best, without getting beyond the bounds of civilization. The various cycling descriptions are particularly readable. Hunting and fishing each receive a light and amusing illustrated sketch, and canoeists will be pleased with a practical article, with designs to show how an amateur with a knack at carpentering can build himself a canvas canoe for five dollars that will do good service. Summer botanizing, by Professor Bailey, is full of information for outdoor students, while the amenities have their usual lively character.

American Pomological Society, Session of 1883.—The handsome volume containing the proceedings of the Nineteenth Session of this Society, held in Philadelphia, in September last, comes promptly to hand, and the Secretary, *Prof. W. J. Beal*, of Lansing, Mich., deserves much credit in thus having expedited the work. The volume contains all the papers and essays read during the session, with full reports of all the discussions thereon, and the Society's revised Catalogue of Fruits. In the latter a beginning has been made in reforming some of the most objectionable names in the list according to President Wilder's excellent recommendations, and it is to be hoped that this reform will be further carried out and the amendments promptly and generally adopted. This Catalogue, the most complete and exact of its kind published anywhere, and invaluable to any one interested in fruit culture, is furnished free to all members of the Society.

Our Famous Women. *A. D. Worthington & Co., Hartford, Ct., publishers.* Sold by subscription.—An excellent work, well gotten up and well printed. The book contains the lives and deeds of thirty of America's greatest women, from Louisa M. Alcott down to Frances E. Willard, with such names as Charlotte Cushman, Mary Mapes Dodge, Lucretia Mott, Marion Harland, and Harriet Beecher Stowe scattered between. The work is written by twenty women, some of whom are themselves the subject of an article. Thus, Rose Terry Cooke writes upon Harriet Beecher Stowe and Harriet Prescott Spofford, while Mrs. Spofford writes upon Rose Terry Cooke and several others. Mrs. Stowe writes upon her sister, Catherine E. Beecher, and Mrs. A. D. T. Whitney. Kate Sanborn writes on Marion Harland, Mary A. Livermore on Anne Whitney, and Elizabeth Stuart Phelps upon Mrs. Livermore. The articles are well written, a fact which the prominence of their authors assures. The book also contains sixteen engraved portraits, by prominent artists, and are most of them good portraits. The book is entertaining and instructive, and deserves the wide circulation which its own merit is certain to give it.

CATALOGUES RECEIVED.

Indiana State Fair, 1884.—Premium List of the annual fair to be held at Indianapolis, from September 29th to October 4th.

The Zimmerman Manufacturing Co., of Cincinnati, has issued a handsome Catalogue which explains fully the merits of their Fruit and Vegetable Evaporator. Any one interested in that industry will receive the Catalogue free by writing for it. It contains valuable information.

W. & J. Birkenhead, Fern Nursery, Sale, near Manchester, England.—This elegantly gotten up and richly illustrated catalogue of a hundred pages, gives a list of about every species and variety of Ferns found in cultivation anywhere, with prices at which they can be obtained. This is quite a unique catalogue, which shows what may be accomplished by specialists. The hints on the Cultivation of Ferns are concise and practical, and of value to every one interested in the cultivation of these graceful plants.

ANSWERS TO CORRESPONDENTS.

Books on Fruit Culture.—*D. P., Chelsea, Kansas.*—"Barry's Fruit Garden" is the best work on general fruit culture; price, \$2.50. "Fuller's Small Fruit Culturist" is the most concise and

best practical work on the culture of Strawberries and all other small Fruits; price \$1.50. "Roe's Success with Small Fruits," price \$5.00, is a much larger, richly illustrated, and elegantly written work.

Preparing for Asparagus.—*E. V. M., Warwick, N. Y.*—If the ground where the bed is to be made is not occupied now, keep it summer-fallowed, and at every plowing turn under a liberal dressing of yard manure. Plant about October first. If not cramped for space plant in rows four feet apart and allow two feet between the plants in the rows. Of course they may be placed closer, but Asparagus, to produce best results, must have plenty of room.

Cut-worms.—*L. F., Fergus Falls, Minn.*—Cut-worms are among the garden pests most difficult to destroy or guard against. Dr. Oemler, of Georgia, recommends dipping Cabbage or Turnip leaves in a bucket of water in which a tablespoonful of Paris Green has been stirred, and placing them in rows across the fields. He has in this way caught fifty-eight worms under one leaf, and by replacing the leaves every few days a field may soon be cleared of cut-worms.

Agapanthus.—*J. O. R., Rutland, Vt.*—This beautiful plant, which is far too little known, requires a treatment similar to the Calla. When growing and flowering it cannot have too much water, while after that period it should be kept rather dry. Once a year it should be shifted in a pot but little larger than the one it is growing in, using good, rich potting soil. They winter well in a cellar, but do equally well in a moderately warm room. They bloom best when exposed to full light and sun during summer.

Lilies, Amaryllis, Perennials.—*W. A. C.*—Lilium auratum, longiflorum, and other Lilies that have been grown in pots should, after flowering, be transferred to the open ground where they will bloom next year. All are hardy enough to stand the winters of the Middle and Southern States, yet a light covering will be beneficial.

Amaryllis Johnsoni is not hardy, and has to be taken up before winter sets in. It should be gradually dried off after flowering, and only watered again after repotting.

Seeds of *Perennials* may, as a rule, be sown immediately after maturity. Most kinds, if sown early in September, will make a good growth during autumn, and bloom next season. The young plants should be lightly covered during winter.

Lord & Thomas, the enterprising advertising agents of Chicago, have just issued a neat, beautifully enameled Pocket Rule for measuring advertisements. It combines inch, nonpareil, and agate measure, and serves at the same time as a rule and paper-cutter. The firm will mail it to any address for ten cents, and to their customers free.

A Rare Opportunity.—We wish to direct the attention of our readers to the advertisement of the sale by auction of Mr. George Such's collection of plants. This comprises the choicest and rarest and best-grown Orchids, Palms, Ferns, etc., to be found on this continent. So excellent a chance to obtain superb specimens and other greenhouse plants at a low price does not occur often in a life-time.

An Excellent Insecticide.—*Mr. A. S. Fuller,* the eminent horticulturist, writes: "I have been experimenting this season with BULNACI, the California Insect-Exterminator, and am much pleased with the results. It is efficacious in destroying the various species of plant lice, such as *Aphides* and *Thripidae* and similar small and soft-bodied insects. Some large climbing Roses that were badly infested with aphids and thrips were entirely cleared of their enemies by one dusting with Bulnach, and I am fully satisfied that this California product is a most excellent and withal very convenient insecticide."

TAKE NOTICE.

For 50c. (in stamps) 200 Elegant Scrap Pictures. No two alike. F. WHITING, 50 Nassau St., N. Y.

NEW RYE.

Thousand-fold.

The rapidly increasing importance of rye in many sections of our country where wheat culture is not found profitable, as well as the enormous demand for straw for manufacturing purposes, has induced us to import many of the leading European varieties of this valuable cereal. After careful tests and extensive comparative trials, we confidently recommend this as superior to any of the older kinds.

It grows from six to seven feet in height, with extraordinarily stiff and heavy straw, holding up well its weighty heads without lodging; it is long-jointed, bright, and clean, making it adapted to various purposes for which imported straw is generally used. The heads are from six to eight inches in length, profusely filled with large, heavy, and plump grains; so that, combined with its remarkable tillering tendency, it is not rare to find stools which, in verification of their name, produce a thousand grains from one.

In hardiness and yield it is not excelled by any other variety, having wintered splendidly in most severe seasons, producing from thirty to fifty bushels per acre, according to the character of the soil and seasons. On account of its luxuriant growth and profuse tillering, a quarter to a third less seed should be sown per acre than is used of less vigorous-growing kinds.

Price, 4 pounds, \$1.00, by mail, post-paid; per peck, \$1.00; half bushel, \$1.75; bushel, \$3.00.

Bags, containing two bushels, \$5.50.

TURNIP SEED.

All grown from carefully selected roots.

NEW VARIETIES.

Jersey Lily.—Unquestionably the most perfect in outline, and the earliest White Turnip grown; of exquisite flavor; in shape as perfect as an orange; with a single tap-root and very distinct, small top. Per pkt., 5 cents; oz., 10; ½ lb., 25; lb., 75.

Extra Early Purple-top Munich.—A very distinct and remarkably handsome early Turnip, with a bright purplish-red top and fine mouse-tail root. It has proved to be quite three weeks earlier than any other variety sown on the same day side by side with it. Per pkt., 5 cts.; oz., 10; ½ lb., 25; lb., 75.

Turnip, Golden Rose.—The hardest and best Winter Turnip; flesh of a rich golden yellow color, with single tap-root; flavor most delicate and melting. Per pkt., 5 cts.; oz., 10; ½ lb., 25; lb., 75.

If by mail, in quantities of 4 oz. and upward, postage must be added at the rate of 16 cents per pound. For general list of turnip seed, see advertisement of Vegetable Seeds in another column.

PICKLE SEED

OF SUPERIOR QUALITY.

All the leading varieties pure and true to name, raised by the most experienced pickle-growers in the country.

The Farmer's Friend AND GUIDE.

A valuable Book of over 200 pages solid Reading Matter, from the pens of the best writers of the day, devoted to the interests of Farmers, Stock-Breeders, Poultry-Fanciers, Dairy-men, Bee-culturists, Gardeners, the Fireside, etc.

PRICE 25 CENTS, POST-PAID.

B. K. BLISS & SONS,
34 Barclay St. New-York.

POTTED STRAWBERRY PLANTS.

(Ready about the first of August.)
Not Available.

We believe in fall planting of all small fruits, and strongly recommend pot-grown strawberry plants for that purpose, as a full crop of fruit can be had the following season by planting properly grown potted strawberry plants during the months of August and September. By properly grown we mean plants that have been layered and rooted in pots for some weeks before setting out, thus firming root-balls that remain undisturbed and constitute the real advantage that this class of plants possesses over the common or layer ones.

THE GARDENER'S CHRONICLE.

Published at 41 Wellington Street, Strand, London, England.

(ESTABLISHED 1841.)

Contains Articles on all Departments of GARDENING, PRACTICAL and SCIENTIFIC.

REPORTS OF EXHIBITIONS, REVIEWS OF BOOKS, AND NOTICES OF ALL HORTICULTURAL MATTERS OF CURRENT INTEREST.

HOME, COLONIAL, AND FOREIGN CORRESPONDENCE.

This large and handsomely gotten-up Journal is everywhere recognized as one of the foremost Weekly Horticultural publications of the World. SUBSCRIPTIONS FOR THE UNITED STATES,

INCLUDING POSTAGE,

\$6.50 for One Year.

Subscriptions may be sent to

THE AMERICAN GARDEN,
34 BARCLAY STREET, New-York.

The *Gardener's Chronicle* (London) and THE AMERICAN GARDEN both sent one year to any address on receipt of \$7.00.

THIS ELEGANT LADIES' WORK BOX Sent FREE to All!

The accompanying illustration represents, upon a greatly reduced scale, an Elegant Ladies' Work Box, made of fine polished Ebony wood, with a beautiful design in gilt upon the cover. The interior has separate compartments, and is finished in purple and white. The Work Box is supplied with a lock and key, and contains a pair of scissors, a silver-plated thimble, a needle case and a tin case. It is a very handsome and desirable Work Box, and something that no lady can fail to be delighted with. Wishing to greatly increase the already large circulation of our charming Illustrated Literary and Family paper, *The Oracle on the Hearth*, we now make the following unparalleled offer: Upon receipt of only Forty-four Cents in postage stamps we will send *The Oracle on the Hearth* for Six Months, and to every subscriber we will also send Free and post-paid, the Elegant Ladies' Work Box, with its contents as above described. The *Oracle on the Hearth* is a mammoth 16-page, 64 column illustrated paper, filled with charming Serial and Short Stories, Sketches, Poems, Useful Knowledge, Games and Stories for the Young, Wit and Humor, and everything to amuse, entertain and instruct the whole family. You will be delighted with it, as well as with the valuable premium we offer. Remember we send this splendid Ladies' Work Box free to all sending 44 cents for a six months subscription to our paper. Last year we offered a Work Box as premium with our paper, but it was far inferior to the beautiful and substantial box we now offer. This Work Box is made of Ebony wood, beautifully polished, and they have been manufactured in Europe specially for us; it is only by ordering a very large quantity that we have been enabled to procure them at a price which permits us to now give them free to six months subscribers to our paper. Five subscriptions and five work boxes will be sent for \$1.76; therefore, by getting four of your friends to send with you, you will secure your own paper and premium free. This great offer is made solely to introduce our paper to the advantage of it at once. Satisfaction guaranteed or money refunded. As to our reliability we refer to any publisher in New York, or to the Commercial Agencies. Address, S. H. MOORE & CO., Publishers, No. 27 Park Place, New York.

AUCTION SALE of the choicest and rarest collection of STORE & GREENHOUSE PLANTS

Ever offered at auction in the United States, including Orchids, Palms, Ferns, etc. Young & Elliott have received instructions from Willard P. Voorhees, Receiver appointed by the Court of Chancery of New Jersey to effect a dissolution and settlement of all business relations heretofore existing between Geo. Such and Charles and John J. Ridgeway in the plant business carried on by Geo. Such, for their joint account, and a division of the property therein, to sell by auction at the Greenhouses of said Geo. Such, at South Amboy, New Jersey, this valuable and interesting collection of Plants, without reserve, on Tuesday, Wednesday, Thursday, and Friday, 8th, 9th, 10th, and 11th July, at 10 o'clock A. M. precisely each day until the entire stock is disposed of. Catalogues of the sale can be had by applying to Young & Elliott, 18 Cortlandt Street, New-York. By order of W. P. Voorhees, Receiver, New Brunswick, N. J.

WOL. ELLIOTT, Auctioneer.

HAMMOND'S SLUG SHOT, AN INSECTICIDE AND FERTILIZER

Ready for use and safe.

GUARANTEED TO DESTROY

Potato Bugs, Chinch Bugs, Rose Bugs, Slugs,

Aphis Lice, Worms, Caterpillars, and the Striped Bug upon Melons, Cucumbers, Squash and all insects injurious to Grape Vines, Cabbage, Tobacco, Cotton, or Egg Plants, Currants, Fruit or Ornamental Trees, Rose Bushes, and all Shrubs, Greenhouse, and Hardy Flowering Plants.

SLUG SHOT was prepared at first solely to destroy the Potato Bug in gardens, but its valuable properties for the destruction of all kinds of insects, caterpillars, and other vermin, have induced the inventors to manufacture it on a large scale, by which it is offered at a reduced price (as cheap or cheaper than Paris Green), and always of uniform strength, and ready for immediate use without the trouble of mixing.

SLUG SHOT contains, in minutest quantity, POISON! destructive to all insect life, which is most thoroughly diffused through natural and chemical fertilizers, and kills the bug in all stages of its growth. The insect eats it in the minutest quantity, and then appears to become paralyzed, often dying on the leaf without falling to the ground.

It is an impalpable powder, and does not harm vegetation; on the other hand, it is a manure. Dust it on the plants plentifully, either by hand or with a dusting-tin. You can easily make a duster by taking an old fruit can, perforating the bottom, and nailing the can to a stick.

QUANTITY TO AN ACRE.

When plants are small, about 20 pounds are needed; or, take a handful and throw it over each hill, covering the leaves. It does no harm to plants, but, on the contrary, invigorates them greatly.

The color and odor of SLUG SHOT prevent it in any way being mistaken or used for wrong purposes, and its composition is such that it is out of the question for a human being or quadruped to take enough to do any harm. Mr. Hammond, the originator, and his men have worked days and weeks in it without any ill effects whatever.

Pamphlets, giving a full description, with directions for use and certificates from those who have used it for the various purposes for which it is recommended, mailed free to all applicants.

SLUG SHOT is in strong, neat packages, properly labeled, weighing respectively 5, 10, and 15 pounds each. These packages are packed in barrels for the trade. The barrels will hold from 200 to 215 pounds net. Each barrel has a large poster and 100 circulars.

The price is a half cent less per pound when ordered in bulk than it is in packages. Prices, in packages, 5 lbs. 80 cents; 10 lbs. 50 cents; 15 lbs. 75 cents; in barrels in bulk, 4 1/2 cents per pound. Slug Shot cannot be sent by mail. Prices to the trade given upon application.

A PRACTICAL FARMER'S JOURNAL.

THE NORTH BRITISH AGRICULTURIST

Price, 3d.; By Post, 3½d. Post Free for One Year, 14s

OFFICE: 377 HIGH ST. EDINBURGH.

LONDON OFFICE:

145 Queen Victoria St. London, E. C.

The AGRICULTURIST is the only Farmers' Journal printed and published in Scotland. It is essentially a practical paper, being issued exclusively in the interests of Agriculture, and treating of that subject in all its branches, prominence being given to Veterinary Science, Agricultural Chemistry, Dairy and Poultry Management. Breeders of high-class Pedigree Stock will find in it much accurate information on points of interest to them.

The AGRICULTURIST is published every Wednesday Afternoon in time for the Evening Mails, and from its very large circulation among farmers and land-owners in England and Scotland it is a first-class journal for advertising.

Farms to be Let; Farms for Sale; Sales of Pure-bred Stock, such as Shorthorns, Herefords, Alderneys, Clydesdales, etc.; Agricultural Estates for Sale; Agricultural Seeds; Artificial Manures; Agricultural Implements; Machinery and Engines.

Money Orders should be made payable to CHARLES ANDERSON, Edinburgh.

Agent for the United States:

A. S. ALEXANDER,

Vinton, Benton County, Iowa, U. S. A.

CLUB ORDERS.

TEA CLUB ORDERS.

We have made a specialty for seventy years of getting away as Premiums, to those who get up clubs for any goods, Dinner and Tea Sets, Gold and Silverware, etc. Teas of all kinds, from 20 to 75 cents per pound. We do a very large Tea and Coffee business, besides sending out from 60 to 90 CLUB ORDERS each day. SILVER-PLATED CASTERS as Premiums with \$5, \$7 and \$10 orders. WHITE TEA SETS with \$10 orders. DECORATED TEA SETS of 44 pcs., or DINER BAND or MOSS ROSE SETS of 44 pcs., or DINER SETS, of 106 pcs., with \$20 orders, and a host of other Premiums. Send us Postal and mention this Paper, and we will send you full Price and Premium List. Free of charge. Average 75 cents per 100 lbs., to points West. GREAT LONDON TEA CO., 805 Washington Street, Boston.

DAIRY GOODS. CHURNS

We make from the best material Superior Articles of Dairy Goods, that are models of strength and simplicity. Unquestioned proof given of their durability. Sole manufacturers of Curtis' Improved Factory Churn, Mason's Power Butter Worker, Lever Worker, Curtis' Square Box Churn, Rectangular Churn, Cream Vats, Dog Power, etc. "One Family Churn at wholesale where we have no agent." All goods warranted exactly as represented. TWO GOLD AND FOURTEEN SILVER MEDALS awarded for superiority. CORNISH, CURTIS & GREENE, Fort Atkinson, Wis.

ZIMMERMAN FRUIT AND VEGETABLE EVAPORATOR

Made of Galvanized Iron. FIVE SIZES. 15,000 SOLD. Economical, Durable and Free Frost. Will pay for itself in 30 days use, out of sale of its own products. FREE! Our Illustrated Catalogue and Treatise. Address, ZIMMERMAN MFG CO., Cincinnati, O. or Burlington, Iowa.

Our Beautiful Oil Colored Transparent Campaign Pictures!

We have them with the TRUE Photographs of the President and Vice-President BOTH PARTIES, DEMOCRATIC AND REPUBLICAN NOMINEES.

They are White Wax Varnished, Metal Frames, with loops to hang them up. Size 5 1/2 x 7 1/2. Suitable for the window or wall, and are the most complete of anything of the kind ever offered for the price. This style of picture was only introduced a month or so before the end of the last campaign and was sold only by a few agents in the New England States, and were sold as fast as they could be finished. An agent at one political gathering sold 300 sets inside of two hours, which netted him \$32. He said he thought he could have sold 1000 if he had had them that day. This same party, who has a business in Boston, has left it to push these pictures, and he says that he expects to make from \$25 to \$30 per day through the campaign season. As we have the capacity now for turning out these pictures, we intend to keep a large quantity of each candidate on hand, and shall thus stand ready to supply those who want them, and in any quantity. We predict large sales by Agents, for they cannot fail to find a demand in every house, office, shop or store in every State in the Union, for the Republican or Democratic candidate.

Sample, by Mail Post, 15 cents. One set, President and Vice-President, 25 Cts. One Hundred, \$6. Address F. O. WEHOSKEY & CO. Providence, R. I.

VACATION AT HOME.

"Whom shall we spend our summer vacation?" has been a question occupying thousands of city and country residents during the past month. An occasional change of scenes, surroundings, and occupation is beneficial, if not absolutely necessary, to every one. The constant running in the same grooves dulls and sours our minds, as much so as a pot-plant, growing in the same soil without change, becomes debilitated and sickly.

The sea-shore, the mountain regions, watering-places, foreign lands, and an endless variety of other pleasure resorts, offer an unlimited amount of attractions to those possessing sufficient means for their enjoyment. But what shall those do whose circumstances compel them to stay at home; shall they give way to despair and complaints about the hardship of their lot? By no means. The degree of enjoyment and pleasure life offers us is fortunately not proportionate to the size of our bank account, but depends mainly upon ourselves. "The world is as we make it."

Few, comparatively, are aware of the capabilities and facilities for enjoyment at home and in one's own neighborhood. In most large cities there are valuable collections of objects of art, science, industry, etc., of interest to every intelligent person; yet many city residents are entirely ignorant of their existence, and are only made aware of it when visiting friends make inquiry about them. Then only, in order to entertain their guests, they discover the vast resources for enjoyment at home.

No one is so fettered by circumstances that he cannot, during a part of the year at least, devote a whole or half a day each week to wholesome, inexpensive recreation. A visit

to the libraries, the museums, the art galleries, the parks, short trips to the country, are within the reach of all, and can be made as productive of enjoyment as an extended journey, provided one's heart is in it.

and offer shade and rest under their graceful foliage; flowers expand and spread their fragrance; birds sing their sweetest tunes; and nature's beauty is spread out everywhere for king and beggar alike.

Not less are vacations needed by farmers and others who live in the country summer and winter. However beautiful the landscape, and salubrious the location may be, a change and new impressions are as necessary to the country resident as to the city dweller. Those living within easy reach of a large city will find an occasional day's visit to it—for the sole purpose of recreation—a most delightful diversion, but the vacation must be complete, and not partly devoted to business.

Then, how few persons living in the country are familiar with all but their immediate neighborhood. An hour's walk or drive away from the ordinary roads of travel would frequently bring them to undreamed-of beautiful scenery and charming surprises, and the thus discovered landscape, the shady grove with its grand old trees, the lovely lake, or mossy glen may all be enjoyed as much as if they were a hundred miles away. The home garden itself may

THE GLEN'S RETREAT.

Far down the glen, where the shadow reigns
And lonely springs in secret weep,
Where round the streamlet's rillet-veins
The golden mosses creep,
Where, 'mong the lichen'd stones asleep,
The lingering waters love to stray—
There gladness waits, in ferny deep,
To woo us down from day.

Far down the glen 'mong growing things,
Where ne'er a sunbeam breaks the spell,
Where Nature's fondest whisperings
The listless ear compel,
The springs of thought, with welcome swell,
Will round the heart their rapture spray,
And faith's resistless transports dwell
Where dwelt the doubts of day.

Ah, yonder, while the dew-drop clings
Forever to the lichen's breast,
While every breeze fresh odor brings,
And all things speak of rest,
While dreams relieve the mind oppress
And chase the care-clouds all away—
Ah, there, if aught on earth be blest,
'Tis surely blest to stay. — Good Words.

But those who start out for a day's excursion, and are all the time lamenting that they must return to the city at night, and that the hours are not weeks, and that they do not have money enough to go to Europe, might as well stay at home. They belong to that unfortunate class of people who never enjoy what they have, and live only in the expectancy of the unattainable; they would not be happier if they had millions, for happiness is not in their hearts. The sun shines as bright, and warms the earth for rich as well as poor; seasons come and go; trees grow,

be made to furnish no small amount of recreation, by carrying out long-deferred plans and improvements, tidying up everything, having a kind of outdoor house-cleaning, and in many ways different from the every-day routine work.

No two persons would probably agree entirely upon the same mode of taking a vacation; what would afford delightful recreation to one might prove tedious to another; every one must take it, as far as feasible, according to his individual inclinations; but in whatever way you take it, do take a vacation.

The Vegetable Garden.

SEASONABLE HINTS.

Head Lettuce in summer can only be produced under special care, as Lettuce is naturally a cool-climate plant which, in our hot, dry summers, will, under ordinary conditions, go to seed quickly; and yet, in our large city markets, large heads of Lettuce are offered for sale nearly every day in the year. To grow good Lettuce in summer requires a deep, mellow, loamy soil, plentifully enriched with decomposed yard manure, and in dry weather the beds have to be thoroughly watered every evening. The plants must have plenty of room—twelve inches each way—and sowings during midsummer prove generally more successful if they are made where the plants are to remain, without transplanting, thinning them out merely to the desired distances. There are only few varieties suitable for summer cultivation. *Salamander* and *Deacon* are the best of a large number we have experimented with.

Celery.—For fall and early winter use Celery is planted at intervals during July; but for a winter supply nothing is gained by planting before the first of this month. Very rich, deep soil and plenty of water are the principal requisites for success with this delicious vegetable, and without these it is almost useless to attempt its culture.

The old method of planting Celery in deep trenches has been almost entirely abandoned, saving a very great amount of labor and accomplishing as satisfactory results. When pricked out or transplanted plants can be procured, they are far preferable to those directly from the seed bed, as with these there is seldom any loss in transplanting; they suffer less in dry weather, and may be planted at any time, while ordinary plants cannot be set out safely except during damp or rainy weather.

When all is ready,—that is, when the ground has been made as rich and mellow as possible,—stretch a line (never plant a crooked row of Celery), and along this set out the young plants five or six inches apart, the latter distance being the best. Cut off half of the tops, and the ends of all roots that are over three inches long; then plant with a transplanting stick or dibble, and press the soil around the roots as firmly as possible. If the subsequent days should be very dry, watering may be necessary evenings, and light shading during midday.

Exterminating Sorrel.—"To kill Sorrel, make the land rich and cultivate it well," said a farmer in our hearing, and this dictum corresponds with the popular idea of the nature of Sorrel. So far as the part of cultivation is concerned it is correct enough—thorough and persistent cultivation will free the ground from any and every weed—but that Sorrel grows better on poor than on rich soil is an erroneous theory, not based upon facts. It is true enough that Sorrel will grow on soil so poor that few other plants could find food enough for sustenance; but just give such a sorrel-infested ground a dressing of manure, and you will soon become aware that the weed responds as quickly to fertilizing influences as any useful plant. Cultivation is what kills Sorrel, not manure.

TRIALS WITH INSECTS.

Perhaps nothing has a stronger tendency to dampen the enthusiasm of the amateur gardener than to find the favorite plants that have been developing so beautifully under his careful attendance suddenly attacked and disfigured by a swarm of greedy, repulsive insects; but it is one of the troubles that every gardener must expect to meet. Our Cabbages have their caterpillars and beetles, our Cucumbers their striped bugs and borers, and our fruits their culexios, aphides, and codling moths. Our success in growing these crops depends in no small degree upon our knowledge of insecticides, and our vigilance in applying them. For the benefit of those who are seeking information in this direction, I offer some of the results of my own experience as a practical gardener.

THE CABBAGE CATERPILLAR.

For this caterpillar, the larva of *Pieris Rapae*, I have used Bnhach powder, applied with the Woodson bellows, with complete success. Pyrethrum powder, which is nearly the same thing, is also acknowledged to be an equally valuable agent for destroying this insect. If the powder is fresh and pure, which it not always is when purchased at the stores, it is strong enough to perform its work when mixed with several times its weight of flour, air-slacked lime, or any other fine light powder, by which means the cost of the application may be much reduced. The mixture is said to be more efficacious if allowed to remain in an airtight vessel for a few hours before using. In the absence of the bellows, it may be applied by sifting it through a fine sieve, or by simply dusting it over the plants by hand. This application has the very great advantage of being non-poisonous to the human family, hence accidents in its use can hardly prove injurious to either man or beast.

THE TURNIP FLEA-BEETLE.

For this little pest, *Halitica striolata*, so destructive to the young plants of Turnip, Cabbage, and Radish, I know of no application better than air-slacked lime, dusted over the plants while they are wet. I usually wet the plants from the sprinkler, as far as possible applying the water and the lime to both sides of the leaves. Strong tobacco-water, if applied daily, will prove equally efficacious, and it also seems to stimulate the growth of the plants. I have also used a weak kerosene emulsion, which answers the purpose in keeping off the beetle; but, when used on Radishes, it evidently retarded the growth of the roots. Perhaps the best way of all for avoiding this pest is to inclose our plants subject to its attacks in frames made of boards a foot wide. I have practiced this method with excellent success.

THE RADISH FLY.

Those who attempt to grow early Radishes on heavy soils are much troubled by the attacks of the Radish fly (*Anthomyia Radicum*), which lays its eggs upon the young roots at the surface of the ground, thus so often destroy the roots for table use. I know of no practicable remedy for this pest, but by lightening the soil of the Radish bed with a very liberal application of coal ashes, the injurious attacks may be in a great measure prevented.

CUCUMBER AND MELON BEETLES.

Perhaps none of our garden plants are more harassed by insects than the Squash, Cucumber, and Melon. Unless protected by the gardener, the early life of these plants is a constant warfare; and often, in case of the Squash at least, this warfare does not cease until frost puts an end to the conflict. Surely, in the case of these plants, prevention is better than cure. For the kitchen gardener, the sure way is to protect the hills of these plants with small board frames covered with mosquito netting. The market-grower may circumvent his enemy by starting his plants upon inverted sods in the cold frame, transplanting them, when sufficiently large, to the garden.

To those who see fit to take neither of these precautions, I can recommend no better application than Paris green and water, at the rate of half a teaspoonful of the former to two gallons of the latter, applying the mixture with care to both sides of the leaves.

THE SQUASH BORER.

One of the most incorrigible of insects, in our present state of knowledge, is the Squash-vine borer (*Melittia Cucurbita*). This enemy does its mischief concealed in the heart of the stem, where we cannot hope to reach him with poisonous applications. To cut the worm out by slitting the stem is both costly to the grower and dangerous to the plant. I can see but one valid hope for a successful attack upon this insect, viz., to poison the newly hatched grub as it eats its way into the stem. I have used Paris green mixed with water, at about the proportion named above, pouring the liquid upon the stems for a distance of two feet from the base of the plant, with what seemed in a limited trial to be very great benefit; and while I cannot say this treatment will prove a sure remedy for the evil, I would recommend all interested to aid me in giving it further trial. "ELM."

PROTECTING CABBAGE AND CAULIFLOWER.

For many years it has been nearly impossible to raise early Cabbages and Cauliflowers in our locality, in consequence of the ravages of a white maggot that eats the stalk of the young plants. More than three-fourths of all our early plants have heretofore been destroyed by this pest. This year I tried an experiment with whale-oil soap mixed with kerosene, and found it a most gratifying success. In no case was the mixture applied more than twice, which proved sufficient to save nearly every plant. The soap may be so much diluted that the expense for the material is but trifling, and I hope other readers will give it a trial and report results. H. J. SEYMOUR.

SALTPETER AGAINST THE SQUASH BORER.

A solution of an ounce of saltpeter in a gallon of water is recommended as a preventive against the borer. As soon as the young plants appear above ground, the solution is poured over them in sufficient quantity to saturate the ground. This should be repeated at intervals of four or five days. Three or four such applications are said to be sufficient to protect the plants, and the saltpeter itself is rather beneficial to their growth than otherwise.

LEEK.

For an early crop I sow the seed in boxes in the greenhouse, and when the plants have three or four leaves, set them in the open ground about the time of sowing the seed for the main crop. Before planting, I cut off half the top and half the roots, which makes them much easier to transplant and prevents wilting so badly.

Most people who use them prefer the London Leek. The transplanting of Leeks is a benefit to the plants, by giving them a deeper hold in the soil, and so increasing the bleached portion; for, although the whole plant is edible, there is an advantage in having a strong, large body as well. For the fall crop I transplant in July, in rich soil, three inches apart, in rows one foot wide.

The summer treatment consists in only to keep the weeds down and the ground mellow. I begin to market the early plants the last of July, when the stalk is as thick as the little finger. Bunches of five each sell for fifty cents per dozen, and retail at five cents a bunch from this time on.

The fall crop is gathered by plowing close to the rows with a light plow, and throwing them out with a six-tined fork or spade. They cannot be pulled, as the roots are strong in the soil. Before lifting, I go through the rows and pull or cut off the leaves of the tops. This is an important precaution, as that part would wilt and decay in winter, and is cut off when they are fitted for market; it also lessens the bulk and prevents their heating and rotting so readily. They are dug on dry and sunny days, brought at once into the winter house or cellar, set closely together—not packed—on the surface of the ground, in an upright position, without putting soil about them. The moisture of the earth and air, and the limited light they receive in a temperature of 40°, keep them "green as a Leek" all winter long. Before spring the roots will have taken hold of the soil, and the supply can be kept good till April, and sometimes later. There are but two months in the year when I do not have Leeks to sell.

For the land occupied, and the time given to the crop, with no insects or worms to contend with, I consider Leeks a very profitable crop. One ounce of seed will produce two thousand good, strong plants. It does not pay to set out the little ones; they do not grow big by fall, and the big ones will bring, as I said, fifty cents for sixty roots. The smaller roots, bunched to equal weight with the larger ones, bring as much per dozen, but it costs more to prepare them for market,

and the big ones crowd them out of market, as most customers prefer large Leeks. There is only a limited demand for Leeks, but when a market is secured, they pay well for the time given to their cultivation, provided one can keep up a steady supply.

The principal variety grown, and the one preferred in our markets, is the *London Flag Leek*; it has a larger body and greener top than any other.

Extra large Carentan is a newer kind, of extraordinary size and large leaf growth, but not as heavy in body.

Large American Flag and *Large Roman* are also well-known varieties grown by market gardeners, as well as in private gardens.

W. H. BULL.

LARGE CARENTAN LEEK.

HARVESTING AND STORING POTATOES.

I dig Potatoes as soon as the tubers have matured, which is indicated by the dying of the vines. I have dug Potatoes when the vines were green, but this was under exceptional circumstances; and generally the tubers should not be disturbed till the vines are altogether dead; then they should be taken from the ground at once. There is no longer any increase in the size of the tuber, and the best quality is secured by the early harvesting. Those who leave the tubers in the ground longer, generally do so through fear of the Potatoes rotting if stored. But proper storing will never cause a matured tuber to rot.

I have found no better Potato-digger than an 8-inch diamond plow attached to a gentle

horse. The plow must be sharp, and set to run so deep that it will pass under all of the Potatoes. I plant my Potatoes in drills—the way Potatoes should be planted. I plow a furrow along each side of the drill, just up to the Potatoes. Then two more furrows will turn the drill upside down and expose the Potatoes. I find that fewer are cut with the plow than when a hoe, spade, or fork is used. If you think the gatherers have missed any, harrow the patch, and the missing Potatoes will be brought to the surface. But the plow turns up the Potatoes so effectually that harrowing the ground is rarely necessary.

The less soil adhering to the Potatoes the better. The amount of earth adhering depends upon the character of the soil and the amount of moisture in it. Some soils are sticky. The more moisture in the earth, the more it will adhere. Therefore, Potatoes should not be dug when the ground is wet.

As fast as dug, the tubers should be placed in a heap in one corner of the field. If it is hot weather, they must be protected from the rays of the sun by a covering of boards or boughs. I leave the tubers in a pile until they are thoroughly dried on the surface. Then, if in the summer or early fall, I remove them to a shed, the barn, or perhaps the smoke-house—any building where they will have plenty of air and be shaded from the sun. When moving them this time, I pick them up by hand, pull off the roots, and rub off all earth. To do this may seem unimportant, but I can testify that it adds greatly to the keeping qualities. I leave the Potatoes in the shed or barn until there is danger of their being frozen, when I store them in the cellar. Potatoes should be handled with care, and one but a wooden shovel should be used.

I believe that Potatoes, and Apples, are finer flavored when buried in the

ground than when kept over winter in a cellar; but I put mine in a cellar because I have a most excellent one, and to do so is most convenient. The floor of my cellar is perfectly dry, yet I elevate the potato-bins above it. The corner posts of the bins I make three feet and one-half long. The floors of the bins are placed two feet from the ground, leaving the bins one and one-half feet deep—as deep as they should be. I use no straw in the bins, as it draws damp and favors mice. If barrels are used for storing Potatoes in, they should be set upon blocks. Potatoes keep best in the dark. By observing the directions here given, I never have any difficulty in keeping Potatoes in good condition.

JOHN M. STAHL.

The Fruit Garden.

SEASONABLE HINTS.

Summer Pruning of Raspberries and Blackberries consists in topping the young canes when they have reached a height of two and a half to three feet. They will then throw out side shoots, which, in turn, have to be pinched in when ten to twelve inches long. This pruning makes the canes stockier, so that they will stand up under a heavy load of fruit without stakes or trellises. If more than four young shoots come from a stool, they should be cut out. The fruit from these will be larger than when all are allowed to grow.

Old Canes.—There is some difference of opinion as to the best time for removing the old Raspberry and Blackberry canes. Formerly it was thought necessary to cut them out as soon after bearing as possible, so as to direct all the strength of the roots to the new canes; but now, high authority claims that the withering canes are still of value to the roots and young growth. Accurate experiments being wanting, we incline to the opinion that the benefits resulting from leaving the old canes till the following spring can at best be but little, and are fully overbalanced by the inconvenience and annoyance they cause. They surely look anything but tidy, and are a hindrance to the full expansion of the young canes.

Killing Blackberries.—The eradication of old Blackberry plantations and briars along neglected fences is, as generally conducted, a most troublesome and annoying operation, but if the bushes are cut off from the middle to the last of August, close to the ground, few will sprout again. Some years ago, we wished to clear an old Blackberry field that was badly affected with rust. Immediately after the last picking, we cut off all the old and new growth, forked it into heaps, and burned it. Some new sprouts sprung up, which, when about a foot high, were mowed off again. Nothing else was done during the summer. The following spring, the roots were dead and in a decaying condition; there was no difficulty in plowing the ground, and the crop of Potatoes which grew on it that year was one of the best we have ever raised.

Pistillate Strawberries.—It is now believed that the size and quality of pistillate varieties are more affected by character of the staminate variety with which they are fertilized than was formerly supposed. Although sufficiently conclusive proofs are still wanting, it is well to give some attention to this matter when planting pistillate varieties. In a series of experiments made by several prominent fruit-growers, it was found that Cresecent and Manchester became firmer when planted near Wilson, larger near Sharpless, and of better quality when fertilized with high-flavored varieties. Differences in the quality of certain varieties which have hitherto been attributed solely to the character of soil and climate may have been owing to causes of this kind. This is a most important and interesting subject, and it is much to be desired that accurate and extensive experiments will lead to definite results.

Grapevines should not be pruned severely at this season. Pinching in of the end and side shoots is sufficient, and these should never be cut back farther than to the lowest leaf.

NEW STRAWBERRY BEDS.

The gardener who grows but a few Strawberries for home use is quite apt to let the bed take care of itself after it has become an established institution. I know of many beds that are from five to ten years old, and the only care bestowed upon them is in pulling or mowing off the weeds that would otherwise bury the vines from sight. The berries are getting smaller and fewer every year, and soon they will be no better than the wild ones in the meadows.

In the first place, a bed should not be allowed to get into such a tangled, matted condition. I know it seems hard to go in and cut out a splendid growth of vines that is trying to occupy the ground space between the rows; but it must be done, and the boundary lines vigorously established and maintained, or the patch will quickly become unmanageable. Let each row have a strip about a foot wide, and then confine the plants to that by cutting out the remaining space between the rows each fall, after the season's growth is over. This leaves a chance for cultivation, and for working in manure about the rows. If the plants become too matted in the row, it is an easy matter to cut out narrow spaces with the hoe or other implement. Beds that are kept cut back in this way need mulching especially. A matted bed, with more or less weeds and grass on the surface of the ground, will furnish pretty much all the mulching needed of itself; but a patch that is kept well trimmed must be mulched, or it will suffer from the frosts and thaws of winter.

But beds will run out with the best of care, and should never be left more than three years, and many good growers advocate but two. If well cared for, I find that they will do as well the third year as the second, and I don't like to move any oftener than is really necessary. If the white grubs get into a patch, plow it up, if it has been in bearing but a year. Where these troublesome pests abound, beds will have to be renewed often, for every year the eggs of the beetle, from which come the grubs, will be deposited afresh. I think, too, that, unless very intelligently managed, a piece of ground will soon become exhausted in those particular properties demanded by the Strawberry. Rotation of crops is as necessary here as elsewhere.

It is no great task to set out a bed large enough to supply an ordinary family. The ground should first be made thoroughly rich and mellow; then mark out the rows with a rake marker that will not press the earth down, but push it aside and leave a little furrow in which to set the plants. In setting out, a little care should be exercised in spreading the roots somewhat before filling in and pressing down the earth. I have noticed many in setting out such plants "chuck" them down in a little bunch, or with the roots all hanging off to one side, just as they happen to come.

Early in the fall is a good time for setting out Strawberry plants, provided it is not too dry. Set them out as soon as the weather is moist enough, and they will get a good start before cold weather sets in. Then, if they are well mulched, they will stand the winter in good shape. There is usually more time for such work in the fall than in the spring, and the ground is in better condition to work.

There is no fruit more easily grown than

the Strawberry. It is just the fruit for those to grow who have only a limited amount of space at their disposal. Every garden, whether on the farm or in the village and town, should have its Strawberry bed.

W. D. BOYNTON.

IMPERFECT GRAPE FERTILIZATION.

A correspondent in Herkimer Co., N. Y., writes: "I have a Brighton Grape-vine, seven years old, located on the south side of my house in sandy loam soil. It has been spur-pruned, and when it should have fruited, the stamens were deformed and the bunches of Grapes very imperfect.

"Is this defect rare with the Brighton, and is there any remedy?"

"Has soil, location, or method of pruning anything to do with the cause of this defect?"

REPLY BY E. WILLIAMS.

This must be an exceptional case, as, in all my experience and observation with the Brighton, it rarely failed to make full and perfect clusters. If summer pruning has not been properly performed, it is quite probable that the buds on the spurs were weak and destitute of sufficient vitality; hence the difficulty. If strong, well-developed base-buds will be secured on the canes, I think there will be no trouble ordinarily in securing perfect clusters with this system of spur-pruning.

A recent writer, in giving instructions how to prune a vine, makes this statement:

"Shoots from the axillary buds, where the old and new wood are joined, will hardly ever produce fruit. The first bud beyond an axil will be found fruitful, but the clusters that grow from the next bud and several further on will generally be the shouldered bunches of the crop."

This is a loose statement, and is only true or partially so when applied to vines allowed to grow at random after the winter pruning, and not true in regard to vines properly checked by judicious summer pruning. The axillary buds on vines thus treated will not only prove fruitful, but the clusters will be found to be as good as any others, and spur-pruning on such vines only will be found entirely satisfactory. In other words, short spur-pruning, *i. e.*, two buds, and summer pruning must go together to secure best results.

If I have suggested the cause of your correspondent's difficulty, I have also suggested the remedy. But we have other varieties in which this defect seems to be inherent or constitutional; prominent among which are Agawan, Lindloy, Massasoit, Black Eagle, Delaware, etc. These, with me, produce imperfect clusters more frequently than perfect ones. They promise well in the bud, and if the promises were carried out in the blooming and setting, or rather in holding on,—for it may be said that a Grape is set before it blooms,—three-quarter or even pound clusters of those varieties would not be unusual.

Vines badly affected with mildew last year show its effect this season, in impaired vigor and imperfect clusters. The *Wilder*, which is generally very satisfactory in cluster, is this season complained of on all sides as making poor clusters. A neighbor, who has heretofore been remarkably successful with it, reports an entire failure this season, though the only promise was as good as usual. I

can only account for this failure by a weakened vitality; and if this is the true cause, may not the failure of the others be attributable to it also?

I noticed this season that the imperfect clusters retained the caps of the blossoms on the unfertilized berries after the others had commenced to grow. The caps had all started, but the stamens seemed to lack the power to push them off, and possibly, being destitute of pellen also, fructification failed in consequence, and the retention of the caps prevented their more vigorous neighbors from performing this office for them, and failure followed.

It is quite possible the above and similar varieties are weak in this particular respect, and the fact that in the hands of some cultivators they produce good clusters, would seem to indicate that this imperfection, whatever its cause, can be overcome with proper treatment.

These views, though somewhat theoretical, seem reasonable to me; and I hope others who have given the subject longer and more thorough investigation will continue the discussion.

IRRIGATION.

What Colorado people term the "Methuodist" system of irrigation is in common use all over the country by amateur gardeners and lady florists; but, at the best, the watering of gardens and flower-beds by sprinkling with a watering-can is unsatisfactory and laborious, especially where the water must be drawn from wells. To at-

tempt to water a large market-garden or berry field, even with a horse-sprinkler, is nearly out of the question; yet thousands of people over that portion of the United States where systematic irrigation is not generally necessary, feel at times the need of water to tide their more valuable fruits and vegetables through temporary drought.

with water at night, allowing it to filter through the sides gradually. The pots were covered with pieces of board to prevent evaporation.

An interesting account was given of the operations of the Messrs. Smith, market gardeners at Green Bay, Wisconsin. Mr. J. M. Smith, President of the Wisconsin State Horticultural Society, who cultivates thirteen acres of ground, has provided himself with a windmill and tanks, and irrigates when necessary. It requires one thousand barrels of water to thoroughly saturate the thirteen acres. His sons, near by, use a steam-engine to elevate the water. Their outfit of engine, storage tank, distributing pipe, and hose cost about five hundred dollars, and the engine is so much more reliable than a windmill, that Mr. Smith's son proposes to get one also.

Windmills are now thickly dotted over the country, and many a gardener, by providing an elevated storage tank and a distributing pipe, could put his crops beyond the reach of drought. For growing first-class Strawberries, Cauliflowers, Celery, and some other crops, a supply of water is an absolute necessity.

L. B. PIERCE.

THE PARRY STRAWBERRY.

THE PARRY STRAWBERRY.

No other class of Strawberries combines probably so many desirable qualities as the strain originated by Mr. E. W. Durand, and best known by Jersey Queen, Prince of Berries, and others. To this is now added another variety, which, while it possesses all the excellent points of its parent, the Jersey Queen, has the other great merit of being perfect flowered, and therefore not requiring another kind for fertilization.

The Parry was raised in 1880 by Mr. Wm. Parry of New Jersey, from seed of the Jersey Queen, and the following year it yielded already handsome fruit, which was awarded a premium at the Moorestown Strawberry Fair. After harvest, the unprecedented heat and drought destroyed almost every variety in the same plot except this, thus showing its hardiness, vigor, and drought-resisting powers.

The plant is a rank, vigorous grower, with clean foliage and perfect blossoms; berries, obtuse conical, very large, uniform in size and shape, bright, glossy crimson, firm, of best quality, and ripening evenly. It was originally named "Junior Queen," but at the suggestion of the Hon. Marshall P. Wilder, it was changed to "Parry," under which name it is now introduced.

Mr. Durand, the originator of the Jersey Queen, after growing it on light and heavy soils considers it the most valuable Strawberry that has yet appeared before the public.

COPYRIGHTED 1884 BY WM. PARRY ELECTRO. BY A. BLANC. PHILA

tempt to water a large market-garden or berry field, even with a horse-sprinkler, is nearly out of the question; yet thousands of people over that portion of the United States where systematic irrigation is not generally necessary, feel at times the need of water to tide their more valuable fruits and vegetables through temporary drought.

At the last meeting of the Mississippi Valley Horticultural Society in Kansas City, this subject was discussed at length, and some valuable facts brought to light. I was especially interested in what was said in reference to what is called sub-irrigation. This consists in laying drain tiles beneath the rows, and conducting the water into these, instead of distributing it by surface ditches. Several gentlemen agreed that it only took one-tenth as much water in sub-irrigation as it did in surface irrigation.

Porous two-inch drain tiles are laid six or eight inches beneath the rows of Strawberries or vegetables, which are two feet apart. Water is let into the pipes needed, and the joints being cemented, it gradually works out through the pores of the tile and is absorbed by the roots of the plants. One gentleman stated that he watered his flower-beds by sinking porous flower-pots among his plants, plugging up the holes and filling

REVISED FRUIT NOMENCLATURE.

As a beginning to simplify and condense the names of fruits as much as possible, according to the suggestions of President Marshall P. Wilder, the American Pomological Society has in its latest catalogue made the following changes in the names of small fruits. The revised names will hereafter be used in THE AMERICAN GARDEN, and it is much to be desired that they will at once be generally adopted.

The Flower Garden.

DAISIES IN THE CITY.

Away from the soil that bore them,
 Away from the waving grass,
 Away from the winds that kissed them,
 Down in the meadow pass,
 Away from the sun that gave them
 Their hearts of yellowest gold,
 Away from the tears of heaven,
 And the love they nightly told.

Away from the song of the bobolink,
 Away from the song of the rain,
 Away from the song of the reaper's seytho,
 As it sweeps through the golden grain,
 Away from the song of the whirring bee,
 As it seeks the purple Clover,
 Away from the song of the farmer's lass,
 As she sings of her farmer-lover.

Away from the smile of the summer sky,—
 Sweet recollections bringing;
 For in the shadow of these walls,
 I hear the throstle singing;
 I see the face of nature glow
 With all her brilliant treasures,
 And I haunt the scenes of early years,
 And pursue my childhood's pleasures.

And my eyes are filled with tears,
 When in my easement spying,
 These messengers from scented fields,
 And many hearts with sighing;
 And some, perhaps, as I have caught
 From out their fragrance spreading,
 The incense, which the fairer flowers,
 In heavenly fields, are shedding.

HOWARD N. FULLER.

SEASONABLE HINTS.

Mignonette.—This "Little Darling" — which is the meaning of its name — may be had in bloom the year round, and with comparatively little trouble. Seeds sown now in a bed of rich, deep and finely pulverized, rather sandy soil, will come up quickly and produce an abundance of deliciously fragrant flowers during the autumn months and, in sheltered situations, long after frosts have killed all tender vegetation. The seeds should be covered lightly but packed very firmly. To grow *Mignonette* to perfection it is absolutely necessary to allow each plant sufficient room for development in each direction. If sown broadcast, the plants should be thinned out so as to stand at least six inches apart each way; if in drills, these should be twelve inches apart, the seed sown very thinly, and the plants thinned out to six inches at least.

Biennials, plants that do not generally flower the first year, should be sown as soon as the seed is ripe, or the latter part of August and in September, so that the plants get strong enough before the setting in of winter. Many of them may be raised in the open ground, like hardy annuals, and transplanted, but choicé kinds should be sown in pots or seed-pans. As they do not blossom the first year, they may be thinned out or removed from the seed-beds as soon as they are well rooted, and planted either into different parts of the garden or into a nursery bed, in rows, a foot or more apart; keep them clear of weeds by hoeing and stirring the earth occasionally, which will greatly promote their growth, and prepare them for transplanting in the autumn or following spring.

A LARGE PANSY.

Our illustration shows an accurate, natural-size representation of a Pansy flower raised by Mrs. W. A. Wheeler, of Allston, near Boston, Mass. The dried flower is preserved at our office, where it may be seen by any one in doubt about its size. Its shape, according to florists' rules, is not perfection, but its size we have never seen equaled.

With the exception of the *Rose*, no flower is so universally admired, and there is no good reason why a Pansy-bed should not be in every garden. To have beautiful Pansies next spring, the seed should be sown this month, and in September for early summer blooming. For those who really love Pansies, and will give them loving care, there is not the least difficulty in raising them. A partly shaded situation, but not under the drip of trees, is best for their full development. They require a deep, rich loam, mixed with a small portion of sand. As soon as the

A LARGE PANSY.
 (Natural size.)

young plants are large enough to be handled they should be transplanted, ten or twelve inches apart each way, in a frame or some sheltered position where they can be slightly protected during winter.

WATERING SMALL GARDENS.

A rubber hose is generally the most available means for watering gardens in towns and villages in which there are public water-works. But this is so expensive that people of moderate means do not use it extensively. As a substitute for rubber hose I have employed half-inch iron pipe, with very satisfactory results. From the water-pipe in the street to the rear end of my garden, the distance is over three hundred feet. Last year there was not a day, during the entire growing season, when any portion of the garden needed water; but the season previous we had no rain for more than six weeks. During such dry and hot weather the garden needed water almost every day. As a substitute for hose, I purchased two hundred feet of half-inch iron pipe, in lengths

of about sixteen feet each, at \$3.75 per hundred feet. Galvanized pipe usually costs twice as much as the plain iron. To keep the pipe from rusting, a heavy coat of paint was applied to the outside; but pitch or coal-tar, applied boiling hot, will be cheaper and more durable than paint.

Now, instead of burying the pipe in the ground, I laid it on the surface and screwed the lengths together, thus forming a line of pipe from a faucet in the kitchen to the rear end of the garden. About every fifty feet, there is a T-coupling, provided with a short piece of pipe, say six inches long, the ends of which are closed by an iron cap screwed on the end of each short piece where there is a T. By opening the faucet in the kitchen, water will rush in a minute to the farther end of the garden. Now we attach a hose, ten feet long, to any part of the pipe where there is a T, and with that an abundant supply of water can be directed to any part of the grounds.

As soon as one part of the garden has been watered sufficiently, unscrew the short hose from the T, screw on the iron cap, and carry the hose to the next T, remove the cap and screw on the hose, and throw water fifty feet or more on both sides of the line of iron pipe. At the close of the growing season, unscrew the lengths of iron pipe and store them under the floor of a veranda or in the garret until wanted another season.

Iron pipe, couplings, Ls, joints, connections, Ts, and caps can be found in almost any city, and subserve just as satisfactory purpose as rubber hose, which would cost four times as much. More than this, rubber hose several hundred feet long is very inconvenient to handle; it will become bent, kinked, and often damaged in a short time, so that it will leak like a basket. But iron pipe can be unscrewed, placed in different directions, and may be allowed to remain where it is laid for several months without being damaged by the weather.

S. E. T.

A PRETTY CARPETING PLANT.

Tiarella cordifolia.

In rich, rocky woods from Maine to Wisconsin, northward, and southward along the mountains, grows this pretty plant, which, though perhaps unknown to all but a very few of our readers, is thus praised by the *Garden of London*:

This elegant little plant used to pass for a curiosity generally, and we did not think much of it till we happened to see a sparkling bunch of it in the gardens of Mnstead. There the effect of its little, graceful, straight shoots and well-formed leaves was excellent, as it grew on a broken, rocky bank. Being so good in form, so free in its spikes of bloom, and so easily grown and increased, there is something in the plant likely to assist, in more ways than one, tasteful gardeners who are seeking interesting and pretty plants for quiet corners and for "carpets." It is easy to imagine various circumstances in which its delicate growth would be very welcome, either alone or beneath a plant of bolder growth.

ORNAMENTAL GOURDS.

The garden plants most generally grown under this name are botanically *Cucumis* or *Cucurbita*, the latter genus comprising the true Gourds.

While the foliage of the larger kinds is coarse and Squash-like, many of the smaller species are of delicate growth and are very ornamental. The flowers of all are yellow or white and last in perfection only a few hours. All are trailing or climbing annuals remarkable for luxuriant and rapid growth, and thus are very useful for covering trellises, fences, stumps, or any unsightly object.

The fruit, the variety of which our illustration gives a good idea, is of many shapes; in some species of great size, in others very small, in color bright-yellow, green, white or variegated, as the case may be, and is in all the species very freely produced.

The seeds should be planted where they are to grow, after the ground has become warm, in rich soil, and if a season of drought comes during the summer they should be liberally watered.

The growth of a Gourd is proverbial, and the plants will soon cover any object near them, and by midsummer will begin to set fruit. The first frost kills the plants, but seldom before they have ripened an abundance of seed. The fruits of most species have a very hard shell and may be preserved for winter ornaments until they grow very dry, when the bright colors and markings fade.

Of *Cucumis* some of the best are *C. flexuosus*, the Snake Cucumber; *C. dipsaceus*, with teasel-like fruit; *C. Grossularia*, or Gooseberry fruited; *C. medulliferus*, with showy thorny orange-scarlet fruit, and *Melochito*, bright orange.

The small fruited *Cucurbita* are the egg-shaped, Orange, Pear, and Lemon; those with large fruit are the club, sugar-trough, turban, and others, but except for curiosity these latter are not very desirable.

An allied genus is the *Tricosanthes*, which we also illustrate, which is very ornamental both in flower and fruit. If planted in a very warm situation it will ripen its curious fruits out-of-doors, but if one has a spare rafter in the greenhouse it can be most advantageously occupied by this plant during the summer.

The culture is only to plant the seed and train the plant. It will grow thirty feet in a season, every day give an abundance of fra-

grant white flowers which have long delicate fringes, and soon set snake-like fruit which is often three foot in length, and which changes when ripe to bright orange-scarlet. The best species is *T. colubrina*, but *T. anguina* is ornamental.

Nearly related to the Gourds is the well-known Balsam Apple (*Momordica*), a slender climber with delicate foliage. To grow it in perfection the seeds should be started in pots and the plants turned out, without breaking the ball of earth, into the border in early June. It should have a sunny exposure and rich, moist soil. Though the foliage is

WHY PLANTS DIE IN GARDENS.

To enumerate and describe all the various causes from which plants die would require a good-sized book. Those even which are ever active in the best managed as well as in neglected gardens are not few in number, and are pointedly summed up in the following by a correspondent of *Gardening Illustrated*:

Because most plants in a state of nature grow amongst other vegetation, and their roots are in a more even temperature and more equal state of moisture than they are in pots and borders.

Because when a plant has finished growing in a garden it is generally cut down before the leaves and stems have finished their services to the plant, which starts for its next growth with less vigor in consequence.

Because the natural food of plants is the rooted product of decaying vegetation—leaf-mold, of which plants grown in ordinary garden borders receive but very scanty supplies.

Because garden borders are kept swept and garnished during winter, and the plants consequently lose the protection of their own dead leaves and stems, as well as of other dead leaves which the wind gathers about their crowns.

Because this tidying up of all decayed leaves causes all vermin, slugs, snails, wood-lice, etc., to lay their eggs and congregate about the crowns of the plants as the only place where they can find food and protection, and where they devour the shoots and buds in winter and sprig as fast as they appear, and kill the plants.

Because garden borders are hoed, dug, forked over, and tidied up at all seasons, causing a continual tearing, wounding, and destruction of the growing roots of plants. Half the growing energy and life of the plants is in the tips of the young rootlets, and the loss of these is like the loss of nerve force and blood to a human being.

ORNAMENTAL GOURDS.

handsome and the yellow flowers very pretty, the fruit is the remarkable part of the plant; this when ripe is bright-orange color, and splits, turns back like a Turk's Cap Lily, showing the rich scarlet seeds. The species are *M. balsamina* and *charantia*, known as the Balsam Apple and Pear with reference to supposed curative properties. Either is worth growing and is very ornamental. If trained over trellises or arbors they will soon cover them and afford dense shade.

E. S. RAND.

AQUILEGIA CÆRULEA JAMESII.

The plant described under this name in a former issue had, as we have learned since, previously been named *Aquilegia cærulea alba*, which name should, therefore, have the right of priority; and, although this name may sound somewhat inconsistent, it is not more so than that of a "White Blackberry," one being as much a reality as the other.

The Window Garden AND GREENHOUSE.

PLANTS FOR WINTER BLOOMING.

Most of the usual winter-blooming plants are now growing in the open garden, where, by pinching, keeping clean, and giving or receiving plenty of water, they are stocky and healthy.

People who do not have greenhouses—nothing but their windows to depend on for their winter blossoms—had better begin to lift and pot their plants early, in order to have them well rooted and established in the pots while the weather is yet warm and favorable. Such plants bloom better and sooner than poorly rooted ones. See to it that all plants are properly cleaned and free from mealy bugs, red-spider, and scale. These insects increase immensely on indoor plants. Have soil and clean pots ready, and as soon as you pot a plant, if it needs it, stake and tie it.

CARNATIONS.

Cease pinching these. If you have cut off the flower-shoots that appeared during the summer your plants should now be nice and stocky; but do not pot them till September.

BOUQUARDIAS.

These blossom well out-of-doors, but at the expense of the indoor winter crop. Lift and pot them this month, or early next, and get them well rooted before cold weather sets in. They are tender, and unless carefully handled in lifting, wilt badly.

POINSETTIAS.

These delight in warm sunshine, and like to be plunged out-of-doors in the summer, but not planted out, as they lift poorly. From the time they start into growth in spring till they bloom in winter, they require to be kept warm and supplied with water. After they have finished blooming they should be kept dry. If we keep them outside in fall, during the cool nights of September or October, they will lose some of their leaves and become considerably enervated.

CACTUSES.

Do not let these stay out in cold or wet weather. As soon as the evenings get damp and chilly lift and pot the Cactuses, and place them on the piazza, or other dry, airy place.

FUCHSIAS

that have been pot grown should be kept at rest. Summer-raised cuttings and winter-blooming sorts keep growing.

GLOXINIAS.

Don't excite them to grow till after they have had four months' solid rest. If you have grown them in pots, keep them quite dry; if planted out in cold frames (I grow most of mine in frames, and get better growth and more flowers than from pot plants), keep them a little dry as soon as they show signs of decay, and afterward quite dry; then in October lift the "bulbs" and store them in flat boxes in earth or sand.

CYCLAMENS,

either planted out or in pots, will now have begun to make roots, then repot them. Don't

use leaf mold in your soil; turfy loam and rotted cow manure is a good compost. Water very sparingly till they have made fresh roots and show signs of active growth.

CINERARIAS.

If you have saved your old plants, break them up and treat each sprout as a separate plant. If you have raised seedlings, pot them before they get pot-bound. Keep them as cool as possible and faintly shaded from sunshine, and give them plenty of water.

CALCEOLARIAS.

Treat seedlings as you would Cinerarias, but be more careful in keeping them cool and clean. If under glass,—frame or greenhouse,—keep them as near the glass as possible.

CHINESE PRIMROSES

love to grow in a cool, lightly shaded, cold frame. Repot them as they need it; do not let them get dry; keep them close to the glass and clean, and give them plenty of room. For yielding cut flowers the double ones are best; the blooms of the single ones drop so soon.

CALLAS.

No matter whether your plants have been set out in the garden or laid on their sides to dry up and rest during the summer, you had better repot them and get them well rooted before cold weather comes, and thus insure early blossoms. They like an open, rich, turfy soil, and when growing freely a great deal of water.

HELIOTROPES.

Old plants lifted early and potted bloom well in spring; and plants raised from cuttings in summer and kept growing in pots also afford winter flowers. Of course the plants we lift in September or October may keep up and mature the buds they are showing at the time; but then they are apt to cease growing till they have filled their pots with roots.

NASTURTIUMS (*Tropaeolum Lobbianum*)

should be prepared for winter work. Raise young plants from seeds or cuttings, and grow them in pots out-of-doors. From the time they are a foot high they are in bloom, and keep blooming as long as they live. They are excellent window plants for winter.

BEGONIAS

of the *fuchsioides* and *incarnata* group, if planted out, may be left undisturbed for a month yet. They lift well, and bloom copiously.

VIOLETS.

Cut off all runners, and confine your plants to nice crowns. Young plants are better than old ones. Hoe among them, and encourage them to grow.

PANSIES.

Sow seeds for spring plants. About where you grow your Pansies last spring you will be apt to get any number of seedlings; save a lot, plant them in cold frames or a sheltered place out-of-doors, as thickly as you would young Lettuces, to keep over winter. These you can set out in beds, borders, or frames early next spring.

WM. FALCONER.

CARE OF GERANIUMS.

It is altogether useless to expect that Geranium plants, which have flowered all summer in the open air, will, if taken up and potted, continue to bloom equally well during the winter season also. If Geraniums are wanted for winter flowering, they must be specially grown during summer, although it is not yet too late to prepare a few plants for that purpose. If plants have not been specially reserved, a few should be taken up immediately and potted, care being taken to select the most compact and perfectly formed specimens.

In potting, select porous or soft-baked pots, proportionate to the size of the plant, and place in the bottom of each at least an inch of broken pots, in order to insure perfect drainage. Keep the plants in the center of the pots, and firm the soil well around their roots. When the plants are potted, water thoroughly, and place in a shady situation for a week or ten days, after which time they should be exposed to the sun. Have them well supplied with water, and remove all flower-buds until it is time to bring them inside, which will be on the approach of cool weather. Give them a light, sunny situation, and an average temperature of 55°. Do not crowd the plants, and turn them occasionally, so as to develop an even, symmetrical shape.

The most suitable compost for Geraniums is a mixture of two-thirds well-rotted sods from an old pasture; one-third well-decayed manure, and a fair sprinkling of bone-dust, thoroughly mixed and pulverized before using. Water should be given as often as necessary, care being taken to give an ample supply, and when the pots become filled with roots, liquid manure water should be given twice a week. One ounce of guano, dissolved in two gallons of water, will be a proper proportion for this purpose.

When large specimens are desired the plants should be repotted as often as the pots become filled with roots, or until they have reached the desired size, when they can be treated as above advised.

There are so many good varieties in cultivation that most amateurs find it quite difficult to make a selection of the most distinct, so for their benefit I enumerate twelve double and twelve single flowering varieties, all of which may be relied upon as first-class:

Double.—*Jas. Y. Murkland*, *Heroine*, *Mrs. E. G. Hill*, *Mary Geering*, *Pocahontas*, *Jas. Vick*, *J. H. Klippart*, *J. P. Kirtland*, *Richard Brett*, *Bishop Wood*, *Asa Gray*, and *Golden Dawn*.

Single.—*Clement Boutard*, *Master Christie*, *Jean Sisley*, *W. C. Bryant*, *Mary H. Foote*, *New Life*, *Evening Star*, *Mrs. Windsor*, *Mrs. Gordon*, *Progress*, *Cygnel*, and *Aurora*.

CHAS. E. PARNELL.

ROSES.

"Hybrids," for blooming in pots, should be thoroughly well established in pots before fall, and not afterward excited in growth till forcing time. But "Teas" may either be grown all along in pots, or planted out in summer, and lifted and potted in early fall for winter use. But pot Roses should not be excited into blooming growth unless their pots are well filled with healthy roots.

HIBISUS.

In this extensive genus are comprised annuals, herbaceous perennials, hardy and tender shrubs, and small trees. Among the annuals, *H. esculentus*, the Okra or Gombo of our kitchen gardens, is one of the best known. *H. Moscheutos*, the indigenous Swamp Rose-Mallow, is prominent among the herbaceous perennials, and *H. Syriacus*, the Althaea of our gardens, as a hardy shrub.

H. rosa-sinensis, both the single and double forms, bear very showy flowers, and belong to our most valued greenhouse shrubs, as they are of the easiest culture, and thrive under a degree of neglect that would prove disastrous to most other plants. They bear pruning well, and large specimens, when cut back severely, will bloom profusely.

Our illustration shows a most remarkable new form, *Hibiscus schizopetalus*, which has lately been introduced to cultivation, and is described as follows: "This plant is regarded by the authorities as a variety of the well-known *H. rosa-sinensis*, but it is so remarkably distinct in general appearance that few ordinary observers would consider it so nearly related to that species. The flowers are pendulous, on slender peduncles, the petals being deeply ent, or lacinated, somewhat in the style of the Clarkias. The united filaments of the stamens closely surround the style, and the latter projects about two inches beyond the corolla, terminating in five divisions. The color of the petals is a brilliant orange red; and although the flowers, like

Lamb. It was exhibited at one of the Royal Horticultural Society's meetings, and was honored with a first class certificate. It requires similar culture to that of its congener."

GREENHOUSES FOR AMATEUR USE.

With every year the number of greenhouses and conservatories increases perceptibly, so that already comparatively few

ter in partial shade. These demands can be satisfied most efficiently and attractively by a span-roofed house. The south side will suit the flowering plants and the north side the Ferns, and the latter will also be the place for the cutting-bench. There will be no unsightly north wall, as in a "lean-to" house, and by curving the rafters an ornamental appearance can be given to the house. It should be partitioned into three or, better, four compartments. Two will face the sun; the one nearest the fire will be for tropical and the other for hardier plants; the former should have a temperature of 60° at night, while the hardy plants will do better with 40° to 45°. Both will need abundant air, and therefore must be provided with ample ventilators. The compartments on the north side will be for plants which flourish best in diffused light.

The house may be built twenty feet wide, and as long as the needs of the owner require. The south side should have upright sashes three feet from the ground, for ventilation. From the plate to which these sashes are hung spring the rafters, rising to a ridge nine feet high and eleven and a half feet from the front of the house, giving a length to the rafters of about thirteen and a half feet. The northern compartment will be eight feet wide, with rafters ten feet long, springing from a sill laid on a concrete wall three feet high. This plan gives a steeper pitch to the north sides so

HIBISCUS SCHIZOPETALUS.

country places are found without some structure for the preservation and cultivation of plants during winter. Those contemplating the construction or remodeling of plant houses should now complete their plans so as to have everything in readiness when their tender plants require shelter. The following, from the prize essay of the *Massachusetts Horticultural Society*, by Mr. William D. Philbrick, is full of excellent practical suggestions and advice, well worth the careful consideration of those interested in this subject.

The essayist supposed the wants of the average amateur to be a variety of flowering plants, some stock of bedding plants for use in the garden in summer, and conveniences for propagation. Some of his plants will be tropical, others more or less hardy; some will delight in abundant sunshine, others will flourish bet-

as to prevent snow from lodging. The glass should be double thick, ten inches by twelve,

DOUBLE HIBISCUS.

SINGLE HIBISCUS.

those of other Hibiscuses, are of short duration, yet the plant is both attractive and interesting. It is a native of east tropical Africa, where it was found by the Rev. J. A.

bedded in putty. Ventilating sashes three feet square will be needed every six feet along the ridge on both sides, and a row of posts midway of the rafters.

Lawn and Landscape.

FORMATION AND MANAGEMENT OF LAWNS.

A smooth, velvety lawn should, at this season, form the most attractive and cheerful feature of every country home; but unfortunately there are a great many country residents to be found who are far from priding themselves about the beauty of their lawns. Immense sums of money are annually spent to but little purpose, simply because the owners expect impossibilities and do not give sufficient time for preparation.

"I shall have a good lawn next year, if it takes all summer," said a friend, the other day, who had made several ineffectual attempts in this direction. "You will be more successful if you take all *this* summer and fall," was our reply, and as there are, no doubt, many others among our readers in a similar situation, we give below some of the very appropriate remarks of our correspondent, Mr. Chas. E. Parnell, before the New York Horticultural Society:

In forming a new lawn, the work should not be too hastily and imperfectly done, as this will prove to be a serious mistake, and one that cannot be rectified afterward. In the first place we must see that our grounds have the desired grade, and that they are thoroughly and properly drained, and in the condition necessary to produce a good crop of vegetables; if so, they will produce good lawns.

The preparation of the ground is best done in the fall, so that it can become well settled by the time we are ready to sow the seed in the spring. Prepare the ground by giving a heavy dressing of well decomposed stable manure, and work it in well by plowing thoroughly. A subsoil plow should follow the common plow. Then harrow thoroughly, and finish by leveling the whole as neatly as possible. As soon as the weather becomes settled in the spring, apply to each acre from five to six hundred pounds of bone-dust; harrow it in thoroughly, and be careful to have a good surface soil of from eight to ten inches in depth throughout the entire ground, and finish by having the surface as finely pulverized as possible, removing all sticks, stones, etc.

The ground being properly prepared, the next consideration is the sowing of the seed. This should be done as early in the spring as practicable, choosing a calm day. The sowing should be carefully done, in order to distribute the seeds equally over the entire surface, and not in spots, as this looks bad and is not creditable to the sower. Sow thickly at the rate of from four to five bushels to the acre, and rake the seeds slightly in. Give, if possible, a sprinkling of soot or wood ashes, in order to render the seed distasteful to birds, and finish by rolling thoroughly.

What varieties of grass to sow in order to obtain a satisfactory result is really a serious question. I have no hesitation in saying: Sow June or Blue grass-only.

In advocating the sowing of June grass, pure and simple, I am aware that I am treading on dangerous ground, for I know that many will differ with me. I admit that the June grass will not form a lawn quite as soon as the various mixtures known as lawn

grass, but a lawn of June grass, when obtained, will be found well worth waiting for.

June grass will thrive in almost any soil and situation, with full exposure to the sun or in partial shades; and in seasons of drought, when everything is suffering from want of moisture, the June grass will retain its verdure to the last. However, some will insist upon having a mixture; and, it is said, a very good one can be made by adding two pounds of sweet vernal grass and one pound of white Clover to four bushels of June grass.

About the middle of June our lawn will be looking pretty green; but among the young grass a great many weeds will be noticed, and the temptation to remove them will be very strong; but don't do it, for, depend upon it, any attempt at their removal at this time will do more hurt than good. About the first of July our lawn will be ready to be mowed; but we must not cut too low, and the clippings should be permitted to remain, in order to protect the young and tender roots. After mowing, roll thoroughly; and after this, mow weekly, if necessary, until the grass ceases to grow. In the autumn the annual weeds will have disappeared, and the perennial ones can be cut out with a stout knife.

It often happens that it is very inconvenient to prepare new lawns, and in such cases we must try to restore the old. In order to do this properly, we must commence in the autumn. First fill up all inequalities by carefully lifting the sod, filling in and replacing it. At the same time, remove all perennial weeds, and then give a good dressing of stable manure. As soon as the weather becomes settled in the spring, the manure should be removed. Then rake thoroughly, using a good iron rake, and be particular to remove all dead grass, moss, etc. When this is done, give a good dressing of bone-dust and sow grass-seed as for a new lawn. Roll well, and as soon as the grass is long enough, mow weekly throughout the season, excepting in seasons of severe drought. It seems almost superfluous to remark that mowing should always be done with a lawnmower in preference to the scythe. The work is thus more quickly accomplished, to say nothing of its neater and more attractive appearance when finished.

Moles are sometimes very annoying. The only remedy for these pests consists in the proper use of a good trap.

Sodding, at the best, is slow and expensive work, and, unless for places of very small extent, I would not advise the use of sods. In forming new lawns, however, it is sometimes absolutely necessary to lay sod along the margins of walks, and also on steep banks, as heavy rains might wash away the soil before the seed has had time to vegetate. Any clear sod can be used for this purpose, care being taken to firm it well with the back of the spade.

In seasons of severe drouth some resort to watering; but unless one has an abundant supply of water and the necessary facilities for doing the work thoroughly, it is better not to make the attempt, for any more hurt than good. If the ground is properly prepared, the mowing properly attended to, and the clippings allowed to remain, little or no injury from drouth need be apprehended.

PLANTING FORESTS.

A writer in the *American Journal of Forestry*, in pointing out the requisites for success in stocking artificial forests, lays down two very important essentials,—namely, thorough preparation of the soil and the selection of healthy and vigorous plants. Prairie and other land is to be very thoroughly plowed, and harrowed and re-harrowed till reduced to a complete state of pulverization. It will do no harm to plant the ground thus prepared for one season with Corn or Potatoes, in order to continue and perfect its condition.

The young trees before setting out should be well examined, the writer asserting, no doubt with truth, that a very large percentage of all the forest trees planted on the north-western prairies are practically dead before they are set out. This is especially true of Evergreens, and the trouble is aggravated by the fact that many planters do not know a dead Evergreen from a live one, and set out much stuff which is only fit for the brush-heap.

This remark will apply to other than forest planting, judging from the large number of dead Evergreen trees all through the country within a few months after transplanting. There is a great deficiency in the proper and intelligent care of young trees, from the moment they are lifted from the nursery row till well and properly fixed in a fine mellow soil where they are to remain; and the remedy appears to be line upon line until owners and their employes understand that trees are to be treated with a care equal to that given to young animals, and that they cannot be thrown about and exposed to the air at the roots with impunity.

No planter should value himself on his skill until he can take up and set out a thousand or even ten thousand young trees without a single lost one, for if all have a good and equal chance none will die.

BEAUTIFUL MAPLES.

Two new varieties of the Norway Maple have recently been introduced from Germany, and promise to become important acquisitions. Both have the vigorous, elegant, clean growth for which the type is so justly esteemed. Mr. W. C. Barry describes them as follows:

Acer Schwedlerii has bronzed purple leaves, which appear to the best advantage during the spring-time and early summer. As the season advances, the leaves change to a duller shade, which is less attractive. But in this respect it differs little from purple-leaved trees generally, as they all lose their richest tints during the hot summer days.

A. Reitenbachii is of quite recent introduction, and while its foliage lacks the richness and brilliancy of color for which *A. Schwedlerii* is noted, its purple shade is more enduring and lasts till late in the season.

A. Lorbergii is also quite new, but it does not differ enough from the old variety, *A. dissectum*, to be of much value. The latter is a rare and handsome variety, and has always been scarce, owing to the difficulty which nurserymen experienced in obtaining suitable specimens, its growth being always more or less crooked. *Lorbergii* seems to be a better grower, and as it can be propagated more successfully it may displace *dissectum*.

Foreign Gardening.

CINNAMON CULTURE IN CEYLON.

About 1770 De Coko conceived the happy idea, in opposition to the universal prejudice in favor of wild-growing Cinnamon, of attempting the cultivation of the tree in Ceylon. This project was carried out under Governors Falk and Vander Graff with extraordinary success, so that the Dutch were able, independently of the kingdom of Kandy, to furnish about four hundred thousand pounds of Cinnamon annually, thereby supplying the entire European demand. In fact, they completely ruled the trade, and would even burn the Cinnamon in Holland lest its unusual abundance should reduce the price.

So determined were the Dutch to retain the monopoly in the produce of Cinnamon that the plants were limited to a certain number, and all above that number destroyed, besides which large quantities of Cinnamon, after having been prepared for market, were frequently thrown into the sea or burnt. It is recorded that on the 10th of June, 1760, an enormous quantity of Cinnamon was wantonly destroyed near the Admiralty at Amsterdam. It was valued at eight millions of livres, and an equal quantity was burnt on the ensuing day. The air was perfumed with this incense; the essential oils, freed from their confinement, distilled over, mixing in one spicy stream, which flowed at the feet of the spectators; but no person was suffered to collect any of this, nor on pain of heavy punishment to rescue the smallest quantity of the spice from the wasting element.

When Ceylon came into the hands of the English in 1796, the Cinnamon trade became a monopoly of the English East India Company, and it was not till 1833 that this monopoly was finally abolished, and the Cinnamon trade passed into the hands of merchants and private cultivators.

A very heavy duty, to the extent of a third or half its value, was imposed upon Cinnamon up to within so recent a date as 1853. At the present time by far the largest proportion, as well as the finest quality, is obtained from Ceylon, where extensive plantations exist.

The Cinnamon-tree, which is very variable in form and size, is known to botanists as *Cinnamomum zeylanicum*. It is very generally distributed in the Ceylon forests up to an elevation of from 3000 to 7000 feet. The best quality bark is obtained from a particular variety, or cultivated form, bearing large, irregular leaves. The barks, however, of all the forms are very similar in appearance, and have the same characteristic odor, so that it is sometimes impossible to distinguish the best trees from appearance alone. It is not uncommon, indeed, for the Cinnamon peelers, when collecting bark from uncultivated plants, to taste a small portion before commencing operations, and to pass over some trees as unfit for their purpose. On the south-west coast of Ceylon, on a strip of country some twelve or fifteen miles broad, between Negumbo, Colombo, and Matura, the best quality of Cinnamon is found up to an elevation of 1500 feet.

Sir Emerson Tennent states that the five principal gardens in the above district were each from fifteen to twenty miles in circum-

fence. Owing, however, to the enormous extent of Coffee cultivation, up to within the last few years, many of the Cinnamon gardens have given place to Coffee, which has since been so seriously devastated by the *Hemileia vastatrix*, that Coffee-planting has in many plantations been itself abandoned.

The management of the Cinnamon plantation has been described as similar to that of the Oak coppice in England. The plants are pruned to prevent their becoming trees, so that several shoots spring up, four or five of which are allowed to grow for a year or two. At this period the grayish-green bark begins to change color, and to assume a brownish tint. As the shoots arrive at the proper state of maturity, at which time they are usually from six to ten feet high, and from half an inch to two inches thick, they are cut down with a long-handled hatchet-shaped knife, known as a *catty*. The leaves are then stripped off, and the bark slightly trimmed of irregularities, the trimmings being sold as Cinnamon chips. It is next cut through at distances of about a foot, and cut down also longitudinally; it is then very easily removed by inserting a small sickle-shaped knife, called a *mama*, between the bark and the wood.

After removal the pieces of bark are carefully put one into another and tied together in bundles. In this state they are left for twenty-four hours or longer, a kind of fermentation taking place which helps the removal of the outer bark. To effect this, each piece of the bark is separately placed on a stick of wood convex on one side, and by carefully scraping with a knife, the outer and middle layers are removed. At the expiration of a few hours the smaller quills are placed within the larger, and the bark curling round forms a sort of solid stick, generally about forty inches long. These sticks are kept for a day in the shade to dry, and then placed on wicker trays for final drying in the sun, and when thoroughly dried are made into bundles, each weighing about thirty pounds.

Notwithstanding that the Cinnamon plant has been introduced into India, Java, China, Senegal, Brazil, West Indies, and other parts of the world, the bark imported from these places is deficient in aromatic qualities, and Ceylon Cinnamon still holds its own as the very best quality brought into the market.—*London Graphic*.

SAND-BINDING PLANTS IN INDIA.

In his report to the Government Revenue Department, Dr. Bidie states that the plants formerly employed near Madras were chiefly the Goat's-foot Creeper, *Ipomoea pes-caprae*, and the spiny, pink-like grass, *Spinifex squarrosus*. Lately, however, extensive plantations of *Casuarina mucicata* have been made with decided success. This tree, Dr. Bidie says, exists now for many miles along the coast north and south of Madras, and has greatly improved the appearance of what was before a sun-beaten, sandy waste. There can be no doubt, also, that the plantations have rendered the fields behind them more valuable for affording shelter, and in some cases have permitted land to be brought under cultivation which would otherwise have remained in a waste state.

The Casuarina is a very hardy plant near the sea, and will grow down to high-water mark even amongst loose sand. The secret

of its flourishing in such situations is due to the fact that the subsoil water is always near the surface, and that the sand, although apparently barren, is generally largely mixed with decayed organic matter. When the trees in a Casuarina plantation are left unpruned, they throw out decumbent horizontal branches, which develop roots, and thus fix the sand. If the trees are cut, these rooting branches, when left intact, throw up shoots, and thus the forest is naturally renewed. In the shade of an established Casuarina plantation the ground is littered with the minute twigs shed by the trees, and this top-dressing, if left undisturbed, shortly decays and fructifies the soil. The importance of the Casuarina in the reclamation of waste sandy tracts on the Indian coast can hardly be overestimated.

A GREEK OLIVE-OIL FACTORY.

From the churches our host took us to inspect an olive-oil factory, of which there are several in Pyrgi, so that the stream which waters the village is brown with olive-juice, like water tinged by peat in an Irish bog. Here they use no machinery or modern appliances in pressing the oil,—merely the old primitive wooden press. Women, or sometimes mules, walk round and round, revolving a wheel which crushes the Olives; in this condition they put them into sacks, and then into that "black-faced heifer which devours oak-wood," as the Chiotese, in their figurative way, are wont to describe their ovens. The sacks are then placed one over the other in the press, and two men turn a post which pulls a rope, which drags a stick, which tightens the press, and the oil oozes into the receptacle prepared for it, with water inside. The oil and water, of course, do not amalgamate, the dregs sink to the bottom, and the pure oil flows into jars prepared for it.

It is impossible to realize the affection people have for Olives in a purely olive-growing country. "An Olive with a kernel gives a boot to a man," is a true adage with them. It is the principal fattening and sustaining food in a country where hardly any meat is eaten. It takes the place of the Potato in Ireland, and on the Olive crop depends the welfare of many. An olive-yard is presented to the church by way of glebe, and the peasants collect on a stated day to gather these sacred Olives, which they buy from the church, and always at the highest market value.—*Macmillan's Magazine*.

GARDENERS IN FRANCE.

A correspondent of *Der Gartenfreund* gives a sketch of the mode of life of a journeyman gardener in France, from personal experience. According to the writer's experience, the position of an under-gardener in a private establishment in France is a most unenviable one. In the first place, it is compulsory to wear the blue linen blouse, small clothes, apron, and cap, and to introduce one's feet into sabots, which are far more ungainly and incomparably more noisy than boots. On the other hand, one has the benefit of enjoying more fresh air in France than elsewhere, for the hours are from four, or, at the latest, five in the morning until late in the evening. Further, there is no distinction between a professional gardener and a common laborer.

Horticultural Societies.

THE INTERNATIONAL EXHIBITION OF FRUITS AND PLANTS.

The Horticultural Department of the World's Exposition at New Orleans, to be held next winter, has now been fully organized and placed under the direction of Mr. Parker Earl of Illinois, Hon. P. J. Berckmans of Georgia, and Charles W. Garfield of Michigan. A mere efficient committee could not be selected in our entire domain, and the consent of these gentlemen to serve in this capacity is in itself a guarantee of success.

The managers expect to secure an International Exhibition of Fruits and Plants which will be of the greatest value to all of the vast interests connected with horticulture. To provide proper facilities for so important an exhibition, they have erected a large and beautiful Horticultural Building or Conservatory, the walls and a large portion of the roof of which are covered with glass, and specially adapted to the exhibition of both fruits and plants. This building is six hundred feet in length, with an average width of one hundred and fourteen feet. It will furnish table room for twenty-five thousand plates of fruit, and forty thousand feet of space for the exhibition of plants. Apartments with suitable heating arrangements for the care of greenhouse and stove plants will be provided.

Extensive space has also been assigned to this department in the beautiful grounds adjacent to the Horticultural Building, for the planting of large exhibits of trees and plants. The Government of Mexico will fill five acres or more of this space; the States of Central America, the State of Florida, and, it is hoped, many other States and nations, will here occupy spacious grounds in the exhibition of their sylvan and floral wealth.

The managers tender their assurance that this exhibition will be managed throughout in the most liberal spirit, and with the earnest desire of securing an unprecedented opportunity for the exhibition, the study, and the comparison of a wider range and a greater wealth of agricultural products than have been hitherto gathered together.

All communications and inquiries should be addressed to the Chief of this Department, Mr. Parker Earl, Cobden, Ills. The exhibition will open December 1, 1884, and continue not exceeding six months.

SOCIETY OF AMERICAN FLORISTS.

During the recent session of the Association of Nurserymen, held at Chicago, at which a large number of leading florists were present, a society with the above title was organized.

It was stated that the number of florists engaged in the legitimate business of raising flowers was nearly ten thousand. That dealers and those engaged as decorative florists, and those connected with the branches of the profession, and whose interests also are to be considered by the society, are nearly five thousand. The spontaneous response to the question as to whether a society of the kind was desirable, left no doubt as to the future of the society. Its objects were briefly stated as:

forms, by advising and comparing the growth of the business in each district.

Second. To award certificates of merit to all new and deserving flowers.

Third. To have each year an exhibition at the time of the annual meeting in one of the large cities.

Among other points suggested was a Protective Fund for the insurance against loss by hail and fire, and the security of the trade generally.

The annual dues for membership are \$2.00, and the first regular meeting will be held at Cincinnati in August, 1884.

The officers elected are John Thorpe, Queens, N. Y., President; M. A. Hunt, Wright's Grove, Chicago, Ills., Treasurer; E. G. Hill, Richmond, Ind., Secretary.

With the rapidly increasing importance of floriculture throughout the land, such a society seems to be capable of doing an immense amount of good not only in the interests of its members but in the promotion and development of refined horticultural taste generally; and with so able a board of officers as the gentlemen elected to lead it, the society can hardly fail to become a grand success.

AMERICAN ASSOCIATION OF NURSERYMEN.

Mr. Peter Henderson's paper on Advertising, read before this society, and from which we quote the following, deserves the careful attention of advertisers, as the art of advertising is understood by comparatively few, while every one who has something to sell is anxious to learn it.

"Long ago," said Mr. Henderson, "I came to the conclusion that unless the advertiser has something to sell of which he has the exclusive control, and something that a large portion of the community wants, the amount invested will never be returned to him in profits the year it is invested. In other words, if \$10,000 is invested in advertising Trees, Plants, or Seeds, the profits resulting in sales from such advertising is not likely to be \$10,000, probably not \$5,000, the first season. But there is no doubt that advertising, judiciously and persistently done, will pay, always provided that the goods offered for sale are sold at a reasonable price, and are true to representation. The public, apparently, are easily deceived, but they will not long submit to humbug. The enterprising peddler of the bulbs of "Blue Dahlias" and "Red Tuberoses," or of the Apple-trees that produce Apples as big as Pumpkins, knows enough never to try the same game twice in the same district, and is forced to find his gullible flock continually in new pastures. But although it is my belief that few advertisers ever get the money invested in advertising back the first season, yet there is no question but that persistent advertising, judiciously done, over a period of ten, or perhaps even five years, will never fail to pay, always provided that the business is a legitimate one, that the goods sold are as good and cheap as are offered by men who do not advertise, for the reason that when the article advertised attracts a customer, if he finds that the goods he received are satisfactory, the chances are more than equal that you will hold him for a patron just as long as he wants the goods that you have to sell.

"The ways of advertising are nearly as varied as the articles advertised, and the

great points to discover — what are the best mediums and the best means? It is not always the largest subscription list that brings about the best results. All depends upon whether the paper circulates among the class of people who want the goods you have to offer. The different branches of our profession often throw their money away for want of knowledge in this particular. If you have expensive articles of luxury to sell, a paper of one hundred thousand circulation among the working classes will not give as good results as one having a circulation of five thousand among the more well-to-do class, while a cheap article of utility might do better among the one than the other.

"Although in advertising, as in nearly everything else, all of us imitate more or less the methods of our predecessors, still, the man who has fertility enough to use well-judged original methods, other things being equal, will certainly get ahead of the man who is simply a slavish imitator. This is not only true in advertising, but it is true in nearly all the methods of business operations. The beaten tracks are too plain to be seen, and consequently competition comes in, and the profits are reduced. But when men are gifted with originality or fertility of ideas, they are enabled to take short cuts that lessen labor and attain the same results. Following in the tracks of another requires neither energy nor enterprise; and when a man indolently follows in the wake of another, whether in advertising or in anything else, rest assured that it will only be by some rare chance that he ever gets even abreast in the race."

MASSACHUSETTS HORTICULTURAL SOCIETY.

The July exhibition was good in all departments, and the large number of visitors was especially noticeable. Mrs. Margaret Parker exhibited flowers of *Nelumbium speciosum*, the Sacred Lotus of India, and *Linum charis Humboldtii*, or Water Poppy. Mrs. P. D. Richards presented another collection of native plants, making, in all, one hundred species exhibited by her the present season. John C. Hovey showed a new double *Amaryllis* from Japan, and *Convolvulus leptophyllus* from New Mexico. Joseph Talley exhibited a finely flowered Orchid (*Brassia verrucosa*), and Hon. Marshall P. Wilder the now Rose raised and named for him by the late lamented Henry P. Ellwanger. It is of fine form, color and fragrance and by its late blooming gives indications of becoming a continuous bloomer. Mrs. E. Wood contributed a handsomely arranged vase of flowers, and E. H. Hitchings a plant of *Cicer aristinum*. The bouquets of Sweet Peas from J. H. Woodford were much admired.

All the fruits of the season — Raspberries, Currants, Blackberries, Gooseberries, and early Pears — were represented by good specimens; of Gooseberries, very large specimens of Speedwell were shown by Warren Fenno, and Whitesmith by Mrs. E. M. Gill.

In the vegetable department the most noticeable exhibit was by B. K. Bliss & Sons, of New York, of vines of Bliss' Abundance and Bliss' Everbearing Peas. One of the former bore seventy-one pods, and one of the latter seventy-five, and another (of the latter kind), which was not counted, was thought to have a hundred pods. The Society's Silver Medal was awarded for these Peas — from the Society's Report.

Household Pets.

HOW TO KEEP GOLD FISH IN HEALTH.

In reply to this inquiry we quote from *Pease's Feathered World* the following:

1. Cover the bottom of the aquarium with clean, coarse sand to the depth of about one inch and a half. Avoid fine sand and soil.
2. Insert the plants with a stone over each bunch, to prevent their disturbance by the fish.
3. In a few days, when the plants show that they are thriving, by the production of oxygen bubbles, put in the fish, not before.
4. Beware of the common fault of putting in too many fish, and be careful as to the admission of sticklebacks, injurious insects, etc. Some beetles are very destructive to fish.
5. Never give the fish bread. In good condition they require no feeding; but a pinch of dry-fish food, broken into minute pieces with the finger and thumb, is good for them. They are very fond of it, and will soon take it from the fingers when called. If forgotten, no harm will follow.
6. Do not let the aquarium remain in a strong sunshine or glare of light; a position between two windows is the best. If in a window, the light should be regulated with the blind or frosted glass.
7. In addition to the rooted plants, it is well to have a few of the round-leaved water plants floating on top.

The water in my aquarium has not been changed for twelve months; I simply add a little from time to time to make up diminution by evaporation. If the fish remain near the surface, gasping for air, it is a proof either that the aquarium is overstocked with fish, or that the plants are not growing healthily, some of the foregoing rules being broken. It is well to have a few water snails in the aquarium. A sponge fastened to a stick will suffice to cleanse the interior sides, leaving the side next to the light uncleaned whereby the light is qualified. Once fairly started, there is no further trouble whatever.

HOW BIRDS LEARN TO SING.

A Wren built her nest in a box on a New Jersey farm. The occupants of the farmhouse saw the mother teaching her young to sing. She sat in front of them and sang her whole song very distinctly. One of the young attempted to imitate her. After proceeding through a few notes, its voice broke and it lost the tune. The mother recommenced where the young one had failed, and went very distinctly through with the remainder.

The young bird made a second attempt, commencing where it had ceased before, and continuing the song as long as it was able, and when the notes were again lost, the mother began again where it had stopped and completed it. Then the young one resumed the tune and finished it.

This done, the mother sang over the whole series of notes the second time with great precision, and again the young one attempted to follow her. The wren pursued the same course with this one as with the first, and so with the third and fourth. This was repeated day after day, and several times a day, until each of the birds became a perfect songster.—*Holden's Bird Magazine*.

Miscellaneous.

THE VALUE OF LAUGHTER.

Laugh merrily while life is here,
For death cuts short all laughter;
Laugh all thy life, and let the tear
Come, if it will, hereafter.

More laughter in the world would bring
The "touch of nature" nearer;
Good-will will flourish 'neath its wing,
And man to man be dearer.

No time like now; the future lies
A darkened road before us.
So let thy laughs outweigh thy sighs,
And merry be thy chorus.

We know that man is prone to tears,
And born an heir to sorrow;
But what's the use of doubts and fears
Of what may be the morrow?

The evil of to-day, we read,
Sufficient is for keeping;
So laugh away, let naught impede,
And give a truce to weeping.

MARKET ITEMS.

THE BUSINESS OUTLOOK.

Although several small houses have failed within the past few days, a better feeling is gaining in business circles.

Fruit and grain crops are both very promising, and the outlook for the future is indeed encouraging. The real injury done by the Wall street failures is very slight in legitimate business circles.

The prospect for a good fall trade was never better, and the opinion seems to be general among jobbers that this will be the case. A good will is half the battle; and, if manufacturers and jobbers will it, their hopes will be realized. The farmers always do their duty.

INCUBATION vs. THE HEN.

There is a great demand for early chickens, and in large cities they find a ready market at from fifty to sixty cents per pound; but to get these high prices, they must be hatched in February, March, and April, and as hens are not sittingly inclined that early, they must be hatched in incubators.

"I have two incubators, holding 480 eggs," says a respondent. "They are a complete success; being cheap, and so simple that any one can handle them.

"I have 212 hens, and from them and the incubators I have sold, since March first, \$1428 worth of chickens and eggs. I run my incubators the year round, and think there is no more profitable business."

SOUND vs. UNSOUND FRUIT.

Now that the pickling and preserving season is approaching, ladies should watch the market, and, of all things, remember that to "do up" unsound fruit and vegetables is a foolish waste of time, money, and a damage to health, especially in cholera year. More than usual care should be exercised in the selection of fruit, especially for children.

At all times, during the season for it, fruit is cheap, and it is poor economy which, for a few cents less, purchases that which, when eaten, endangers health and life.

BANANAS.

The Bauana has come to be almost a necessity in thousands of families to whom

it was unknown a few years ago. They are fried and served as an *entrée*; pies are made of them, with a delicate upper and under crust, with plenty of sugar and a suggestion of spice, but when sliced thin and mixed with chopped Pineapple, or with chopped Oranges, they are simply delicious. At breakfast they are served by removing the skin, cutting the Bananas in two pieces crosswise, and piling them on a pretty china or fancy plate.—*N. Y. Market Journal*.

INTELLIGENCE OF THE ORIOLE.

On the western side of Central Park, very near One Hundred and Third street and Eighth Avenue, stands a row of Elm trees, difficult to approach on account of a heavy growth of Syringa bushes around them. On a branch of one of the trees, about sixteen feet from the ground, a pair of Baltimore Orioles set to building a nest a few weeks ago. They chose the extreme end of the bough, with evident intention of making it a hazardous experiment for any bird-nester to attempt to molest them. But, in their excess of caution, they appeared not to observe what the few persons whose eyes were keen enough to see the first labors of the little architects saw—that the branch was much too slender to support so large a nest as an Oriole builds.

When the nest was about two-thirds finished, the birds saw their mistake. The branch had bent so low that it was getting perilously near the grass. Work was at once stopped, and the builders sat close together for a long time, and seemed to be discussing the situation. Finally, they flew side by side to a bough about fifteen inches over the one on which their nest was, and, leaning over, inspected the distance. They seemed to be satisfied, and, though it was growing rapidly dusk, the birds flew away in opposite directions. In the morning, it was found that they had firmly secured their habitation, and prevented the branch from bending lower, by passing a piece of white string, which they had found somewhere in the park, over the upper bough, and fastening both ends of it securely to the edges of the nest. The building then went rapidly on, and the Orioles are now engaged in hatching their eggs. Very few persons have seen the nest, and there is a fair prospect that their skill and ingenuity will be soon rewarded by a brood of young Orioles.

The Baltimore Oriole is a very intelligent bird, but a New-York ornithologist, who saw the nest, said he had never seen an achievement quite equal to this one before. He says the art of knitting fibers or strings together is well known to many birds. The Weaver-bird of India builds its nest out of a large, strong leaf, which it stitches together at the edges, making a compact and closely-adhering funnel.—*New-York Sun*.

A GIGANTIC PLANE-TREE.

Professor Virchow recently exhibited at a meeting of the Berlin Medical Society, photographs of a gigantic Plane-tree, growing in the Island of Cos, under the shade of which Hippocrates is said to have held medical consultations. The tree now stands in the market-place of Cos, on the east side of the island. The branches, which spread over nearly the whole of the market-place, are supported by marble pillars.

WHITEWASHING CELLARS.

One good agency for keeping the air of the cellar sweet and wholesome, says Dr. R. C. Kedzie, in the *N. Y. Tribune*, is whitewash made of good white lime and water only. The addition of glue or size, or anything of this class, is only a damage, by furnishing organic matter to speedily putrify. The use of lime in whitewash is not simply to give a white color, but it greatly promotes the complete oxidation of effluvia in the cellar air. Any vapors that contain combined nitrogen in the unoxidized form contribute powerfully to the development of disease germs.

Lime powerfully promotes oxidation, especially in damp situations. I have seen cellar walls where the mortar was covered with a white efflorescence of nitrate of lime. So powerfully does lime accelerate the oxidation of nitrogenous matter for the formation of nitrates that it causes the "lime rot" in the foul alleys of cities. The nitrate of lime is very soluble, and the rain soon washes away the lime of the mortar, leaving only the sand to hold the bricks together. The same tendency to oxidation may keep the cellar free from foul odors by oxidizing the volatile nitrogen compounds into innocent nitrate of lime.

CHEWING THE CUD.

Every child living in the country has stood and watched this curious operation, and wondered what the lump was which he saw come up in the cow's throat, and then go down again after she had chewed it for a certain length of time. And perhaps he may have seen the anxiety and turmoil produced on a farm by the report that some one of the cows had "lost her cud," and as the result of this excitement he may have seen the absurd attempt to "make a new cud," in the hope that the cow would by such means be restored to good condition. There is in the minds of a large proportion of readers so little correct understanding of the true nature of "chewing the cud" that a few words concerning it may not be amiss.

A very large tribe of animals, of which sheep and cows are only familiar examples, are called in works of natural history *Ruminantia*, because they all *ruminat*, they chew the cud. They do so because their peculiar organs of digestion require it; they can get their nourishment in no other way. They have, it is said in the books, four stomachs, but the statement is not strictly correct, for the entire digestion is done in a single one, that which is called the fourth, the other three being only places for preparatory work. Their food is swallowed without being chewed; the chewing is to come later. When this unchewed food is swallowed it passes directly into the first stomach, to use the common term; but the drink which the animal takes goes straight past the entrance of the first into the second. These two serve only to *soak* and soften the coarse food. When the first has done what it can, the food passes out of it into the second, and then the cow or sheep is ready to "chew the cud."

The second stomach, while busily at work in soaking the food, keeps it in motion, and gradually rolls it up into masses, so that in the small upper part there is formed an oblong solid lump of the size that we recognize as

the "cud." This the animal throws up into the mouth, and chews with evidently as much satisfaction as the same act of mastication gives us when we put the most delicate morsels between our teeth. When it is sufficiently chewed, the mass is swallowed and its place taken by another which had been rolled up in the meantime.

But the "cud" thus masticated does not return to the second stomach from which it had come. It passes smoothly into the third, a place for additional lubrication, and then into the fourth, where the true digestion begins and ends.

This is, in brief, the whole story, and we see how naturally the chewing comes in; it is the same as in our own case, only that it is at a different stage of the food's progress, and we see also what "losing the cud" really is. The cow or sheep is suffering from indigestion; the "second stomach" has failed to roll up the little masses suitable for chewing, and there is nothing which the poor beast can bring up. Of course, therefore, the one thing required is to *restore the tone and power of the stomach*; not to burden it with an "artificial cud," which would only increase the difficulty instead of relieving it. — *Scientific American*.

USES OF THE COCOA-NUT.

A Chinese proverb says that there are as many useful properties in the Cocoa-nut Palm as there are days in the year; and a Polynesian saying tells us that the man who plants a Cocoa-nut plants meat and drink, hearth and home, vessels and clothing, for himself and his children after him.

The solid part of the nut, says Grant Allen, supplies food almost alone to thousands of people daily, and the milk serves them for a drink, thus acting as an efficient filter to the water absorbed by the roots in the most polluted or malarious regions. If you tap the flower-stalk you get a sweet juice, which can be boiled down into the peculiar sugar called (in the charming dialect of commerce) jaggery; or it can be fermented into a very nasty spirit known as palm-wine, toddy, or arrack; or it can be mixed with bitter herbs and roots to make that delectable compound "native beer." If you squeeze the dry nut you get Cocoa-nut oil, which is as good as lard for frying when fresh, and is "an excellent substitute for butter at breakfast," on tropical tables. Under the mysterious name of copra (which most of us have seen with two described in the market reports as "firm" or "weak," "receding" or "steady"); it forms the main or only export of many Oceanic islands. The thicker portion is called stearine, and used for making sundry candles with fanciful names, while the clear oil is employed for burning in ordinary lamps. In the process of purification it yields glycerine; and it enters largely into the manufacture of most better-class soaps.

The fiber that surrounds the nut makes up the other mysterious article of commerce known as coir, which is twisted into stout ropes, or woven into Cocoa-nut matting and ordinary door-mats. Brushes and brooms are also made of it, and it is used, not always in the most honest fashion, in place of real horse-hair, in stuffing cushions.

The shell, cut in half, supplies good cups, and is artistically carved by the Polynesians, Japanese, Hindeos, and other benighted hon-

thens, who have not yet learned the true methods of civilized machine-made shoddy manufacture.

The leaves serve as excellent thatch; on the flat blades, prepared like papyrus, the most famous Buddhist manuscripts are written; the long mid-ribs or branches (strictly speaking, the leaf-stalks) answer admirably for rafters, posts, or fencing; the fibrous sheath at the base is a remarkable natural imitation of cloth, employed for strainers, wrappers, and native hats; while the trunk, or stem, passes in carpentry under the name of porcupine-wood, and produces beautiful effects as a wonderfully colored cabinet-makers' material. These are only a few selected instances out of the innumerable uses of the Cocoa-nut Palm.

GUANO TESTS.

Probably there is no better method of determining the purity of guano, says the *Scientific American*, than the combustion test, which is as follows:

Pour half an ounce of the guano into an iron ladle, such as is used in casting bullets, and place it upon red-hot coals until nothing but a white or grayish ash is left, which must be weighed after cooling. The best sorts of Peruvian guano do not yield more than thirty or thirty-three per cent. of ash, while inferior varieties, such as Patagonian, Chili, and African guano, leave a residue of sixty or even eighty per cent. Genuine guano leaves a white or gray ash; and a red or yellow ash indicates the adulteration with earthy matter or sand, etc.

This test is based upon the fact that the most important ingredients, viz., the nitrogenous compounds, become volatilized, and escape when subjected to a sufficient amount of heat. The difference of odor of the vapors evolved in the process, according as we are working with first or third class guano, must also be noticed. The vapors from the better kinds have a pungent smell like spirits of hartshorn, with a peculiar piquancy somewhat resembling that of rich, old decayed cheese, while those arising from inferior varieties smell like singed horn shavings.

TAMARINDS.

There are but few people to whom the flavor of preserved Tamarinds is not agreeable; but do those who frequently use Tamarinds know how they are prepared?

According to the *Gardener's Chronicle*, they come into commerce both from the East and West Indies; the latter are simply the fruits, or rather pods, from which the shell or epicarp has been removed, and the pulp, together with the strong, fibrous frame-work upon which it is built, and the seeds are placed in alternate layers with powdered sugar in a cask or jar, over which boiling syrup is afterward poured.

In the East Indies it seems they are prepared by first removing the epicarp and seeds by hand, after which the pulpy portion is usually mixed with about ten per cent. of salt, and trodden into a mass with the naked feet. Of these Tamarinds several qualities are known in the market, the best being free of fiber and husk, and the worst containing both, together with the hard, stone-like seeds, which are commonly eaten in the East Indies after being roasted and soaked.

OUR BOOK TABLE.

The Flax Plant, by *Frank I. Shurick, Fort Wayne, Ind.*—A pamphlet of twenty-six pages, giving the history, value, and modes of cultivation for seed and fiber.

Kansas State Board of Agriculture.—Monthly Report, containing a summary of reports as to the condition of Wheat, Corn, Oats, and Fruit, together with experiments with Fertilizers, etc.

Clark W. Bryan & Co., Holyoke, Mass., publishers of the "Paper World," "Builder," etc., have, with their rapidly increasing business, found it necessary to open an office in New-York. It is located at Trinity Building, 111 Broadway, where they will be glad to see their friends.

Fall Plowing. Profit resulting from a proper preparation of the soil. Also Culture of Grass, Poor catches, Failure of Seeding, Loss by dry weather and insects, Its failure attributed to the right cause. Two articles by Dr. Henry Stewart. Published in pamphlet form by *Nash & Brother, Millington, N. J.*

Diffusion. Its application to Sugar Cane and record of experiments with Sorghum in 1883, by *H. W. Wiley*, chemist to the Department of Agriculture.—The results of the experiments so far show that the yield of sugar from this method is just about double that obtained by the large factories at Rio Grande, Champagne, and other places.

"**The Tribune and Farmer**," formerly published at Philadelphia, has followed "The Continent," and transferred its home to New-York, "the acknowledged commercial and literary head of this commonwealth." It changes, at the same time, from a four to an eight page paper, and shows decided improvement in general appearance as well as in its contents.

The Diet Question. Giving the Reason Why, from "Health in the Household," by *Mrs. Susanna W. Dodds, M. D.* 12mo, paper, 25 cents. Fowler & Wells Co., Publishers, 753 Broadway, New-York City.—This book gives the reason why some articles of diet are better than others, more economical as well as more healthful. It also gives tables showing the constituent elements of different articles of food; the relation of food to physical development as well as to intellect and morals.

Godey's Lady's Book for August is an especially good number, and, considering the high standard of this excellent magazine, this is perhaps as generous praise as could be bestowed upon it. The book is just entering upon its fifty-fifth year, and celebrates this mature anniversary in a fitting manner.

That all may be able to see how beautiful the book is, the publishers (*J. H. Maulenbeck & Co., Philadelphia*) offer to send the new volume (six months) to any address for \$1.00.

Russian Apples, by *Charles Gibb*, Abbotsford, Quebec, Canada. A treatise on the varieties of Apples imported by the United States Department of Agriculture in 1870.—In this pamphlet the author has succeeded in bringing order into the hitherto alarming confusion of Russian nomenclature, and has condensed and translated into English many of the unintelligible names. An accompanying map gives a clear idea of the different fruit regions; and copious notes from the author's and Prof. Budd's experiences during their visit to Russia, make the work highly valuable to all interested in this important class of Apples.

"**The Rural New Yorker**."—It gives us pleasure to note that editor *E. S. Carman* has associated with himself *Mr. J. S. Woodward*, the well-known writer, and one of the most successful farmers of Western New-York. This is a most felicitous combination, upon which both parties are to be congratulated. Mr. Carman's energy and indomitable perseverance, combined with Mr. Woodward's thorough practical knowledge and sound judgment, cannot but result in the still greater usefulness and excellence of the paper itself, as well as to the benefit of agricultural interests in general.

"**Outing**" for August is a midsummer number of fresh and vivid interest. Its frontispiece is one of Garrett's best drawings, with a brief and pertinent poem by *Charles E. Pratt*, entitled "Art in

August." Natural history is represented in a charming paper by *Bradford Torrey*, entitled "Scrapping Acquaintance with the Birds," which shows keen and patient observation, as well as a delightful skill in putting its results into words. The editorial departments are full and interesting, as usual, and the monthly record affords recreative history which will be found worth preserving. "Outing" is gaining steadily in its hold upon the public, and its unique field is one that it fills handsomely.

Swine Products of the United States. A report from the Commission appointed by the President to examine into the swine industry of the United States, and into the allegations as to the healthfulness of the pork products of this country.—This is an exhaustive report, the result of much careful investigation. We regret not to have space to enter into its details, which prove unmistakably that our exported pork in all its forms is fully equal, perhaps superior, in its freedom from taint of every kind, either from disease or deterioration after slaughtering, to the pork of France or Germany, or any country in which the hogs are confined within a narrow compass, and do not enjoy that free run and pasturage which they get in the hog-growing regions of the United States. There is no general prevalence of disease among swine in any portion of this country.

Ohio Agricultural Experiment Station.—*Annual Report.*—This, the second report of Director *W. R. Lazenby*, more than fulfills all reasonable expectations that have been entertained at the organization of the Station under the direction of Prof. Lazenby. As during last year, field experiments with Wheat and Corn have been prominent features in the year's work. When we consider the wide area of the State over which these cereals are successfully cultivated, and their aggregate annual value, the importance of this work is at once manifest. The field experiments are not confined simply to comparative tests of varieties, or yields of definite areas under the influence of different methods of culture and different manures. They include a careful study of the quality and vigor of the seed; the growth of the root; the result of checking growth in one direction in order to stimulate it in another; the effects of self and cross fertilization; the best time and condition for performing the various processes of planting, manuring, cultivating, harvesting, and marketing; the treatment of insect enemies and diseases; a study of climatic conditions, etc. In short, the work includes all the important factors that influence the growth and fruitfulness of the individual plant. Potatoes and garden vegetables, grasses and forage plants, fruits and flowers, have also been subjects of carefully conducted experiments.

A good amount of work has been done in seeds, especially Corn. Over four hundred samples from various parts of the State were examined and tested during the year, and we have not the least doubt that these tests alone have saved to the farmers of the State more than the annual appropriation for the support of the Station.

Considering the limited means at the directors' disposal, and the short time of the Station's existence, the amount of work already done is surprising, and reflects high commendation upon the judicious management of the Board and the earnestness and ability of the director.

ANSWERS TO CORRESPONDENTS.

Keeping Winter Radishes.—*J. F. R., Lansdale, Pa.*—Any kind of pure sand or dry soil will do to pack the Radishes in. Take a box, cover the bottom with an inch of sand, place a layer of Radishes upon it, shake sand between and on them till they are entirely covered, then another layer of Radishes, and so on. The tops have to be cut off, of course, but not the end of the roots. Treated in this way, most roots will winter well.

Lilacs not Blooming.—*E. C. P., Berkeley, Cal.*—It is difficult to say why Lilacs do not bloom, without a knowledge of the conditions under which they are growing. The probability is that the soil is too rich, producing too much leaf growth, to the detriment of flowers. In this case, transplanting to some less fertile spot may be necessary. Cutting off about one-half of all of this year's growth may also produce the desired effect. Root-pruning may also be tried.

Planting Rhododendrons.—*O. H. H., Hickman, Ky.*—In your State, Rhododendrons may be planted either in autumn or spring. In the Northern States spring planting is preferable, and also wherever the ground is not perfectly drained. The proper selection of varieties is of the greatest importance. More plants are lost from not being suited to outdoor culture than from any other cause. In our June number we gave a select list of hardy varieties.

Soil for "Starting Slips."—*W. F. Miller's Station, Pa.*—The best medium in which to place cuttings of nearly all the ordinary house-plants is pure building-sand. This is to be kept very wet until the cuttings become rooted. The young plants are then to be transplanted in small pots,—two to two and a half inches in diameter,—in soil consisting of about equal parts of well-decomposed manure, loamy garden soil, and sand. See article on "Soil for Pot Plants," in June number.

Cabbage Going to Seed.—*H. S., Indianola, Texas.*—The natural tendency of all Cabbages is to run to seed the first year, the heading character having been produced by long-continued cultivation and selection; and unless the most favorable conditions are provided, they will revert to the natural type—that is, go to seed. Highly enriched ground, thorough cultivation, and moisture are the best preventives against Cabbages going to seed. Wintered plants are also more apt to go to seed than those raised in the same year.

Early White Chrysanthemums.—*Mrs. S. P. H., Norwalk, O.*—The differences between florists' flowers are often so small that it is impossible to give their names without seeing the whole plant, and even then it is not always an easy task. From the description given, we should judge this to be *La Petite Marie*. This is the earliest flowering Chrysanthemum we are acquainted with, and holds out till frost. The flowers are pure white with yellow center; the plant is very dwarf, and continuously covered with flowers throughout the season.

Clematis not Blooming.—*Mrs. J. B., Decorah, Iowa*, writes: "Two years ago I received a Scarlet Clematis as a premium to THE AMERICAN GARDEN. A neighbor received one at the same time. I manure the ground heavily every year, and now my plant is seven feet high, while my neighbor's is not much over three; yet hers is in full bloom and had flowers last year, while mine had none yet." This is an excellent description of thousands of similar cases, not only with Clematis, but with other plants. Excess of manure produces leaf-growth, while it diminishes the tendency to flowering. If manure is withheld, the plant will, no doubt, bloom next year.

FROM OUR FRIENDS.

I like THE AMERICAN GARDEN immensely. It is constantly improving.—*C. M., St. Louis, Mo.*

I find sufficient information in a single number of THE AMERICAN GARDEN to pay the cost for a year.—*Mrs. J. E., Chicago, Ill.*

The cover is a great improvement. It not only looks well, but preserves the paper in nice condition for binding. I like THE AMERICAN GARDEN exceedingly.—*E. M., Portland, Me.*

I am much pleased with THE AMERICAN GARDEN. The instructions contained in it are good and reliable, and the illustrations are beautiful. I cannot do without this paper.—*C. W. B., Washington Co., Utah.*

THE AMERICAN GARDEN pleases me very much. I enjoy every word of it, and the colored plates are simply exquisite. It is especially gratifying to me to hear that you mean to keep the paper strictly and exclusively horticultural. Long may you think so!—*Mrs. J. B. C., Cambridgeport, Mass.*

The American Garden Unsurpassed as an Advertising Medium.—*From the Buhach Producing and Manufacturing Co.*: "Out of a large list of agricultural and horticultural papers in which we have advertised this season, THE AMERICAN GARDEN has been surpassed by none, and equaled by but one. It has brought us vastly larger returns than papers which cost us four times as much."—*JAS. E. CONDON, Manager.*"

CHIONODOXA LUCILLIÆ.

GLORY OF THE SNOW.

One of the most lovely, *hardy* flowering Spring bulbous plants ever introduced, producing spikes of lovely azure-blue flowers, with pure white centers. Those who know *Scilla Siberica* will need no further description of this beautiful plant when we say the flowers and spikes are more than twice the size of that little gem. 10 cents each; \$1.00 per dozen.

L. TENUIFOLIUM, the Coral Lily of Siberia.

This dazzling little gem is worthy of all praise. Every one who loves a Lily should secure several of these, as we now offer them at a price even lower than any previous wholesale figure. It blooms out-of-doors about the third week of May, and its graceful, wax-like flowers, of a lovely vermilion-scarlet, cannot fail to impart unalloyed pleasure to all lovers of the beautiful in nature. And being a native of Siberia, is, of course, perfectly hardy. Extra selected bulbs, 30 cents each; second size, 20 cents each.

Longiflorum, var. Floribunda.

This desirable variety is a remarkably robust grower, and blooms about the same time as *L. Longiflorum*. The bulbs grow to an enormous size, and produce from ten to forty flowers each. A bulb of this variety was exhibited in New-York the past Spring, bearing one hundred and forty flowers. It is a native of Bermuda, and the bulbs we offer were imported from there. First size, 50 cents each.

Glory of the Snow.

Lil. Tenuifolium.

POTTED STRAWBERRY PLANTS.

(Ready about the first of August.)
Not Mailable.

A PERFECT POT-GROWN STRAWBERRY PLANT.

We believe in fall planting of all small fruits, and strongly recommend pot-grown strawberry plants for that purpose, as a fall crop of fruit can be had the following season by planting properly grown potted strawberry plants during the months of August and September. By properly grown we mean plants that have been layered and rooted in pots for some weeks before setting out, thus forming root-balls that remain undisturbed and constitute the real advantage that this class of plants possesses over the common or layer ones.

ADDRESS

THE FLORAL WORLD, HIGHLAND PARK, LAKE CO., ILL.

Special Attention is called to the Following Letter from Jas. H. Holmes:

HOLMDEL, N. J., Feb. 28, 1883.
THE ELLIS SPAVIN CURE CO.
GENTLEMEN: In answer to your inquiry of the above date we gladly send you our certificate. We have used the Instrument called Ellis's Spavin Cure upon two of our horses, and in each instance have completely removed two curbs from each horse, and we believe the Spavin Cure to be a most valuable preparation.

Also, we bear testimony to the remarkable properties of your Condition Powders, with which we have accomplished what we have not been able to do with any other remedies. We do not intend to be without them in our stables, and gratefully recommend them to all owners of horses.

JAS. H. HOLMES.

THE ELLIS SPAVIN CURE.—When veterinary surgeons write such letters as the following about a proprietary remedy, laymen are justified in believing that it is a good thing.—Special notice in the *Spirit of the Times*, August 18, 1883.

"STARRIN PLACE STOCK FARM, FULTONVILLE, MONTGOMERY CO., N. Y., July 24.—**THE ELLIS SPAVIN CURE CO.**—GENTLEMEN: Remittances received in good shape. Send me a glass sign, by express, to Fonda, well packed, and I think it will come all right. Also send me some of those cards with a horse's head and shoe on. I have taken off several curbs, 'one very bad'; cured a case of *Sweeney* and *Navicular* disease with the *Spavin Cure*, and restored several worn-out horses with the *Powders*. Yours respectfully,
"CHANDLER QUINTIN, V. S."

Send for free book of testimonials, describing all our specialties.

NEW RYE.

Thousand-fold.

The rapidly increasing importance of rye in many sections of our country where wheat culture is not found profitable, as well as the enormous demand for straw for manufacturing purposes, has induced us to import many of the leading European varieties of this valuable cereal. After careful tests and extensive comparative trials, we confidently recommend this as superior to any of the older kinds.

It grows from six to seven feet in height, with extraordinarily stiff and heavy straw, holding up well its weighty heads without lodging; it is long-jointed, bright, and clean, making it adapted to various purposes for which imported straw is generally used. The heads are from six to eight inches in length, profusely filled with large, heavy, and plump grains; so that, combined with its remarkable tillering tendency, it is not rare to find stools which, in verification of their name, produce a thousand grains from one.

In hardness and yield it is not excelled by any other variety, having wintered splendidly in most severe seasons, producing from thirty to fifty bushels per acre, according to the character of the soil and seasons. On account of its luxuriant growth and profuse tillering, a quarter to a third less seed should be sown per acre than is used of less vigorous-growing kinds.

Price, 4 pounds, \$1.00, by mail, post-paid; per peck, \$1.00; half bushel, \$1.75; bushel, \$3.00.
Bags, containing two bushels, \$5.50.

B. K. BLISS & SONS,
34 Barclay Street, N. Y.

For Sale.

A splendid situation for Market Gardening, Straw-berry Culture, or Dairy. A new farm, 53 acres, deep sandy loam, only ten minutes' distance from Red Wing, Minnesota, a city of about 3000 inhabitants, two railroads, steam-boat communication, etc. A person can haul ten loads of manure a day, and get it free. Taxes very small. Excellent markets for all products. Cause of sale, oil age and poor health. Price, only \$2000. For information, address

M. SARROX, Red Wing, Minnesota (Box 356).

PERFECTION

THE AMERICAN
GARDEN,
March, 1884.

A colored plate of this
charming novelty
appeared in

No.	Per pkt.
276. <i>Ageratum imperial dwarf</i> .—A delicate blue of dwarf habit, highly recommended for pot-culture. \$0.10	
280. <i>Ageratum Wendland's dwarf white</i> .—Of similar habit to the above, with white flowers. Very appropriate for the cemetery, also valuable for bouquets. .10	
358. <i>Aquilegia cerulea Jamesii</i> .—Offered for the first time last Spring; flowers pure white, very large, and borne in graceful racemes; quite hardy .25	
445. <i>Auricula</i> .—The finest prize sorts, saved from choice English hybrids .25	
464. <i>Balsam, camellia-flowered</i> , "White Perfection." The best for pot-culture during winter .25	
517. <i>Calceolarias</i> , extra select, beautifully spotted, extra large flowers—the finest in cultivation .50	
518. <i>Calceolaria rugosa</i> , from the finest shrubby varieties. .50	
689. <i>Centaurea candidissima (ragusina)</i> , splendid silvery-leaved plant for beds, vases, and pots. .25	
691. <i>Centaurea gymnocarpa</i> .—Valuable for its silvery foliage. .15	
731. <i>Cineraria</i> , extra choice, from all the new varieties. .50	
783. <i>Cineraria, new double-flowering</i> .—A desirable acquisition. (Packets contain 25 seeds) .100	
857. <i>Cyclamen Persicum giganteum</i> . This superb variety is a new and greatly improved type, having very broad, beautifully mottled leaves, and stout flower-stalks, throwing the flowers well above the foliage. .75	
880. <i>Daisy, double white</i> , constant and perfectly double, valuable for florists. .25	
1112. <i>Gloxinia</i> , selected from prize flowers of both the drooping and erect varieties .50	
1245. <i>Hollyhocks</i> (very double), saved from an unrivaled collection of English varieties; if sown now, will flower freely next year. .25	
1558. <i>Mimulus</i> , finest mixed, golden yellow and white ground, with crimson, rose, and scarlet blotches .25	
1680. <i>Pansy, English</i> , extra select, saved from the finest prize flowers. .50	
1681. <i>Pansy, New German</i> , in size of flower and beauty of markings this variety is surpassed only by "Bliss's Perfection Pansy" .50	
1884. <i>Priunula sinensis fimbriata</i> (Chinese Primrose fringed), various colors mixed, extra .50	
1890. <i>Priunula sinensis fimbriata filicifolia</i> (new fern-leaved varieties), very beautiful. .50	
1894. <i>Priunula sinensis, fimbriata flore pleno</i> (new double varieties), rose and white mixed .100	
2084. <i>Stock, intermediate</i> , scarlet, white, and purple, extra mixed .15	
2107. <i>Stock, Brompton</i> , superior for pot-culture, scarlet, white, and purple mixed. .15	
2125. <i>Sweet William, auricula-flowered</i> , this variety far surpasses anything before offered. .20	
2135. <i>Sweet William, double and single</i> , mixed. .05	
2272. <i>Wallflower</i> , extra fine double German. .15	

For a more extended list, see our Seed Catalogue.

Hardy Annuals, Biennials, and Perennials for Autumn sowing. Collections of 20 varieties, \$1.00. These collections contain only such varieties, that, if sown during the months of August and September, and slightly protected during Winter by a covering of overgreen boughs, will bloom early the following year.

TURNIP SEED. A New Winter Wheat

WINTER PEARL.

All grown from carefully selected roots.

NEW VARIETIES.

Jersey Lily.—Unquestionably the most perfect in outline, and the earliest White Turnip grown; of exquisite flavor; in shape as perfect as an orange; with a single tap-root and very distinct, small top. Per pkt., 5 cents; oz., 10; ½ lb., 25; lb., 75.

Extra Early Purple-top Munich.—A very distinct and remarkably handsome early Turnip, with a bright purplish-red top and fine mouse-tail root. It has proved to be quite three weeks earlier than any other variety sown on the same day side by side with it. Per pkt., 5 cents; oz., 10; ½ lb., 25; lb., 75.

Turnip, Golden Rose.—The hardest and best Winter Turnip; flesh of a rich golden yellow color, with single tap-root; flavor most delicate and molting. Per pkt., 5 cents; oz., 10; ½ lb., 25; lb., 75.

If by mail, in quantities of 4 oz. and upward, postage must be added at the rate of 16 cents per pound.

For general list of turnip soil, see advertisement of Vegetable Seeds in another column.

This new and promising variety is the result of an experiment made by F. H. Horsford, of Charlotte, Vermont, in 1878, and is a cross between those two well-known wheats, the Diehl and Clawson. The heads are beardless, regular, and very handsome, five and a half inches long, with eighteen to twenty breasts of four grains each. Kernels about the size of the Clawson, hard, plump, and of a light amber color. Straw from three to five feet high, bright yellow, strong and elastic; tillers freely, forty heads having been counted from one kernel. It matures with Clawson, and has produced the past season (1883) in Northern Vermont at the rate of forty-five bushels per acre from one bushel of seed, and would doubtless have been even more productive in a better wheat country. Price: 3 lbs. by mail, \$1.00; per peck, \$2.50; per ½ bushel, \$4.50; per bushel, \$8.00.

Sedgwick Steel Wire Fence

Is the only general purpose Wire Fence in use, being a Strong Net-Work Without Barbs. It will turn dogs, pigs, sheep, and poultry, as well as the most vicious stock, without injury to either fence or stock. It is just the fence for farms, gardens, stock ranges and railroads, and very neat for lawns, parks, school lots and cemeteries. Covered with rust-proof paint (or galvanized) it will last a life time. It is Superior to Boards or Barbed Wire in every respect. We ask for it a fair trial, knowing it will wear itself into favor. The Sedgwick Gates, made of wrought-iron pipe and steel wire, defy all competition in neatness and durability. We also make the best and cheapest All Iron Automatic or Self-Opening Gate, also Cheapest and Neatest All Iron Fence. For Prices and Particulars ask Hardware Dealers or address the Manufacturers,

The Vegetable Garden.

SEASONABLE HINTS.

A properly managed garden should now present as neat and clean an appearance as at any season, and to have it in such a condition pays well in more than good looks only. If successive sowings of the principal vegetables have been made, there will be more abundance and a greater variety during this month than at any other period.

Celery.—"I have always raised good Celery in trenches, and do not feel inclined to change for some untried plan," comments one of our readers upon our recommendation, of last month, to plant Celery on level ground, instead of in deep trenches. We do not believe in "letting good enough alone," when we can better it, and especially when, as in this case, the plan is not only far from untried, but is followed by almost every progressive market gardener in the land. Market gardeners are generally not slow in adopting new methods which afford advantages over older, more laborious, and less profitable ones. But in the family garden, also, this method is decidedly preferable, and its general introduction has been more instrumental in popularizing this peerless winter vegetable than anything else.

To test the relative advantages of the two methods, Dr. E. L. Sturtevant, Director of the New-York Experiment Station, subjected them last year to careful trials. The list of varieties included twenty named samples; one hundred seeds of each were planted in boxes, April 11th and 12th, and placed in a cold frame, where they were covered during severe weather. On July 5th thirty of these plants were set in a trench, one foot deep, well manured at the bottom with thoroughly rotted horse-manure, and thirty plants were planted adjacent upon the level without special manuring.

The first data noted were that the varieties of Celery required from twenty-six to twenty-eight days to vegetate their seeds, and one hundred seeds produced upon the average fifty-seven plants—the variation between varieties being sixteen per cent. of vegetation for Seymour's Solid Red, and eighty-one per cent. for Giant White Solid. Averaging the results obtained in seventeen samples in which the varieties from the two rows are separately noted, it was found that, omitting fractions, plants grown under level culture averaged one hundred and seventy-seven pounds per hundred plants, while those under trench culture averaged one hundred and seventy-eight pounds per hundred plants. The length of the bleached stems was rather greater, and the neckers were rather more numerous upon the plants grown in the trenches; but, on the other hand, the bushes of the stems were more often split and deformed than occurred in the plants grown upon the level. It appears, therefore, from this trial, that the trench culture yielded no advantage for the increased labor involved.

Spinach for winter use should be sown, without delay, in liberally manured, thoroughly worked beds. Better keep the seed in the paper bag than attempt to raise a crop of Spinach on poor soil. Sow in drills a foot apart; use plenty of seed, and when well up thin out so that the plants stand from three to four inches apart.

MORE ABOUT POTATO SCAB.

In confirmation of the opinion expressed in our former issues that scab is not caused by manure nor wire-worms, the experience of our correspondent F. A. B., in Massachusetts, is of considerable interest. He writes:

"The past season I planted White Elephant Potatoes, side by side, on old ground that had been planted three years, and also on new sod ground; used horse and cow manure broadcast, also Mapes's "A Brand" Fertilizer in the hills. The Potatoes on old ground were very scabby, while on the new ground they were as nice and smooth as you could ask for. Now, had the old ground lost some properties necessary to the proper development of the tubers? and what was it? If not, why should they grow smooth on the new ground, all other conditions being the same? I hunted carefully for wire-worms but could not find one. I had about as good a crop on the old as on the new ground, and satisfied myself that honest chemical fertilizers pay, even if you have animal manure."

Another instructive case bearing upon this question, in which scab occurred without the agency of wire-worms or manures, is reported in the New-York Tribune, by H. Wadley, of Iowa:

"In my root cellar is a place holding about ten bushels, sunk two feet below the surface, where we always put our late-keeping Potatoes. Last season the hired girl, about June 1st, reported them all gone. I did not go down until about August, when I moved a box that was standing over one end of the hole, where I found about two bushels of Mammoth Pearl Potatoes, and in removing them I found new Potatoes among them as large as my fist, squeezed into all shapes, and I thought I would cook some of them; and when I cleaned the dust from them they were completely covered with scab—some just beginning to come, some eaten into the tubers more or less. When I put the Potatoes in cellar I picked out every one that I thought was scabbed at all. I believe it to be a fungous growth of some kind."

MUSHROOM CULTURE IN NEW JERSEY.

The French method of cultivating Mushrooms, as given in a recent number of THE AMERICAN GARDEN has furnished many valuable suggestions to growers, and as an additional contribution to the knowledge of this subject an account of the successful culture at the Nichols Farm, Millburn, N. J., may be of interest to many. This place is noted for the fine Mushrooms it sends to the New-York market, and which sell at a remuneratory price.

Here an old hot-house has been changed into a house for Mushroom culture. All the glass and sashes have been removed and the sides and roof boarded up. Small rooms are partitioned off, and beds arranged somewhat after the manner of the berths in staterooms of steam-boats. Heat can be supplied when needed.

Horse-manure freshly made is the basis of the heating material for the beds. The coarsest part of the straw is removed, yet leaving a good proportion of the short, say a foot long, with the dropping. The manure heap is turned over two or three times until the violent heat and smell have left it. Thus

prepared, the manure is placed in the beds to the depth of about fifteen inches—in a manner similar to that of making hot-beds—and left to heat again. If found to remain too cool it is covered with hay to assist in raising the temperature. Should the heat rise over 120° Fahr., the beds are made over again. When the temperature is at about 98°—never above this—it is time for spawning. English spawn is preferred to the French.

The spawn is placed in lumps about the size of hens' eggs, every eight inches and four inches deep. In ten or twelve days it is examined to see if the threads of the spawn have penetrated all parts of the surface, when it will be found that the threads have followed along the straw contained in the heap. In case all straw has been removed, more time is required.

As soon as the spawn has penetrated the mass, inverted sods, taken from good, rich soil, about two inches deep, are placed over the entire bed. In from four to six weeks, the Mushroom will generally appear over the surface. For early crops the beds are made in September, for the later in November. The best temperature for a Mushroom-house is 65°; if much above this the Mushrooms run to stem, if below 50°, they cease to grow, and between 60° and 50° they are very apt to become tough. In very cold weather artificial heat is provided. These beds will supply Mushrooms from two to three months. Water is given only when necessary, and then only in small quantity at a time, in order not to dampen off the stems.

One of the greatest enemies to the Mushroom is the wood-louse. To guard against this the house and beds have to be kept very clean, and all the wood-work is thoroughly whitewashed. J. B. ROGERS.

RAISING SEEDS.

Many farmers and gardeners save at least a portion of the seeds they want for their own use. Of course, some are careful to save only the best; and where this is done with a practical knowledge of how to improve the stock, the plan is a good one. Yet in a majority of cases good seeds can be purchased from those who make seed-growing a business cheaper than you can raise and save them.

A common mistake is to save only the largest seeds, irrespective of other qualities. In many vegetables earliness is as much desirable as size, while quality should never be lost sight of. To pick for the table all the Peas or Beans that mature first, and take what happens to be overlooked for seed, will surely cause a serious deterioration, which will soon cause a considerable difference not only in the quality, but the quantity of the yield. If you want to save seed from these, select one portion of the crop for seed, and do not allow them to be picked. Select the earliest matured and best of these only for seed. It is only by taking considerable pains in this respect that the quality can be kept up.

Of plants that mature seed the second year, such as Parsnips, Salsify, Turnips, Beets, Carrots, etc., smooth specimens must be selected early, and pains taken to save them in the best condition possible.

N. J. SHEPHERD.

THE WATER-CRESS.

Though not a native of this country, the Water-cress, *Nasturtium officinale*, has become naturalized in many of our smaller streams. It finds its most congenial habitat in the limpid brooks that flow from springs, over a sandy or gravelly bottom. Though it sometimes grows in still water, a gentle current suits it best, in which the plants often grow so thickly as to retard, to a considerable degree, the passage of the water. Once established, it becomes a permanent resident, requiring neither manuring nor rotation.

As a salad plant, the Water-cress has been popular, where known, from time immemorial. It is indigenous to the rivulets of Europe and Asia, and we may easily imagine that, centuries before the rude beginnings of the art of horticulture, the unlettered savages were accustomed to enjoy its tender foliage, before the first terrestrial herb had showed itself in spring. We know that Xenophon, the learned Greek historian, was fond of Water-cresses, and strongly recommended their use to the Persians; and among the Romans this piquant herb was believed to possess virtue as a remedy for insanity. Hence the ancient proverb, "Eat Cress and learn more wit."

It was not, however, until comparatively modern times that attempts seem to have been made to grow the Water-cress artificially. It is said that one Nicholas Meissner, a resident of Erfurt, in Germany, first succeeded in cultivating it, about the middle of the sixteenth century. At the present time it is produced in large quantities for the Paris and London markets, and in our own country its culture is beginning to receive attention in a few localities. Doubtless many brooks in the neighborhood of our large cities might be made to serve a profitable use through the introduction of this plant. The culture of the Water-cress is said to prove a very remunerative industry where it has been undertaken. Really favorable locations, however, are not very common.

A springy swamp, surrounded by higher ground, and lying in such a way that the water, when collected into a stream, can be conducted back and forth, through narrow canals, over a gently sloping meadow, offers the best possible conditions. Cresses will thrive, however, in almost any brook that flows directly from springs, and hence does not freeze in winter. By starting a few plants at the outlet of the springs, the seed from them will, in a season or two, be distributed throughout the whole length of the stream, and the Cresses will soon take possession of their field, or they may be started sooner by depositing the plants along at various places, in the brook or canals. The latter, if dug, should be about six feet wide and eight inches deep, provided the water is sufficient to produce a slight current throughout the whole width. It is well, if possible, to have a flood-gate at the outlet of the canal in order to hold back the water in winter, so as to completely cover the plants; but this is not indispensable, as, if the stream is of spring water, the plants will not be much injured by frost.

In gathering the plants, a plank is laid across the stream, on which the workman stands, gathering the leaves into a bunch with the fingers of the left hand, cutting off

the stems with a sharp knife three or four inches below. The Cresses are then placed upright, in the bottom of a small, deep basket, until a compact layer is formed, when a second layer is placed above this, and so on until the basket is filled, when a string is tied over the top, or the baskets are packed in crates for shipping. A basket is sometimes filled on a space two feet square, and often sells at seventy-five cents wholesale. It is said that the lowest price that is received in the New-York market is twenty cents per basket; and, at this rate, a bed one thousand feet long would yield in the neighborhood of three hundred dollars a crop. When it is understood that three

WATER-CRESS.

erops may be gathered during the spring and summer, it appears that the business is a lucrative one. The upper part of the stream may be covered with sashes, at the beginning of winter, to retain the warmth of the water, when two crops may be taken in the winter from this portion of the bed. These winter crops usually prove most profitable of all.

Geese and ducks, as well as cattle, are fond of Water-cresses, and hence should be kept out of the meadow, at least during the earlier part of the season. A flock of ducks may be turned in with advantage after the plants have seeded in August, as they will clear the Cresses of snails, which sometimes

MARTYNIA.

infest them. The small turtles that frequent such streams also feed upon snails, and are hence beneficial. In some cases trout might, perhaps, be reared in the streams with additional profit. "ELM."

MARTYNIAS.

Few plants in our garden attract more attention than this odd-looking vegetable, or flower—for it is both in one. It is of very rank, rather coarse growth, branching and spreading profusely several feet in all directions. The leaves are large and broad, and the flowers are very pretty and showy, resembling in shape those of the Trumpet Creeper, to which family it belongs. The

young pods, which are produced in great abundance, are used for pickling, and form an important part of the "fancy pickles" of our markets. When full grown the pods are three to four inches long, and terminated by a hooked beak; but it is only when quite young that they are fit for use; when older they become hard and woody. The plant is a tender annual, and requires a treatment similar to that of the Tomato.

Martynia proboscidea is the species generally cultivated, but there are several other kinds which may be used for the same purpose, and are equally ornamental.

CORN CUT-WORMS.

Among the Corn cut-worms, says Prof. J. A. Lintner, in answer to an inquiry from a correspondent of the New-York State Experiment Station, some of the species do their work beneath the surface, others cut the stalks at the surface, and others still at about an inch above the ground.

We know of no effectual way of driving these pests from the Corn attacked by them, or for killing them while buried in the ground during the day, by any application that we can make. Lime, salt, ashes, and similar substances have been found to be of no avail. Winged insects may be driven away, but these were in the soil long before the Corn was planted (since the preceding autumn), and will have their living from it until they reach their maturity, unless they can be meantime killed. Thorough autumn plowing, quite late, when the caterpillars had become lethargic from the cold, would have destroyed many.

The caterpillar in this case "eats off the Corn soon after it comes up, just at the surface of the ground," and probably drags the cut-off portion into his retreat beneath the surface to feed upon it at his leisure during the day. His food can be poisoned by dusting Paris green or London purple over the plants while wet with dew. As the more economical and less dangerous in its use, he would ask that the experiment be made with London purple, mixed with flour to a proper degree of dilution, which shall be found by first testing it upon a few hills—perhaps one part of the purple to twenty of flour. If care be used in the application so that the powder shall reach the stalks of the Corn at the point where they are cut off, the small portion of the poison consumed in the cutting-off operation would probably suffice to kill the caterpillar.

The other method, which is known to be effectual, is to employ the cheap labor of boys, by having them go over the field a few times (four or five times at proper intervals are usually sufficient), and dig out and destroy the caterpillars from the hills showing the attack. They are easily found—sometimes as many as five in a hill. A writer who states that he has always found this method successful, bears this testimony in its favor: "One year, on six acres, the worms had begun in such numbers that it was obvious that the Corn would be destroyed unless something was promptly done. We set two men at work, who continued at them for ten days, on and off, amounting to four days' work in all, and costing one dollar per acre, and entirely saving the crop of over three hundred bushels."

The Fruit Garden.

SEASONABLE HINTS.

The Fair Season.—Every visitor at a fair knows that the easiest thing in the world is to find fault with the labeling of the fruits, the arrangement of the plates, and management in general; but only those who have had the charge of such exhibitions are aware of the many, and not a few unsurmountable, difficulties which beset the way of the officers. Advice is generally as plentiful as mosquitos in a swamp, but feasible means are rarely brought to light. The eminently practical suggestions of *Mr. Chas. W. Garfield*, Secretary of the Michigan Horticultural Society, in this regard, are therefore well worth the attention of those in charge of our horticultural exhibitions. He says:

"My two points are these: First, we need to make progress in the labeling of our fruits and other entries. We should have all the prominent exhibits so clearly labeled with cards and placards as to give all the information necessary. Money could not be better expended than in the employment of a skilled man to paint signs and cards during the fair; and I would even go so far as to have the prominent awards placed upon a large bulletin-board, so people could read. These features connected with labels are of the greatest importance to newspaper men.

"My second point is that a great deal more attention be given to skill in ornamenting exhibits. Even a single plate of Grapes may be made to appear twice as beautiful if placed upon the leaves of its own variety. I suggest whether prizes for special work in this direction may not well take the place of our awards for correct nomenclature for a few years."

Planting Strawberries.—Potted plants may still be planted; but at this season, when the soil and air are damper and the temperature lower, there is not so much gained over layer plants as in midsummer. Good plants, now set out properly in well-prepared, moderately rich soil, will produce about one-third of a full crop next year.

Extending the Strawberry Season.—In New-York the Strawberry season commences about New Year, and ends some time in August, and by supplementing with forced greenhouse fruit there is hardly a month in the year when Strawberries are not to be had in our markets. But not all are so fortunate—or unfortunate, as the case may be—to live within city limits, nor have all the means to pay the price for such luxuries, which, after all, are but a poor substitute for home-grown, fresh, ripe, seasonable berries.

The bearing period of a variety lasts generally not over two, and rarely more than three weeks; but by a judicious selection of early, medium, and late kinds, the season may be considerably lengthened at both ends. Now, when making new Strawberry beds, it is proper to give this matter careful attention. Appropriate selection of soil and situation exerts also considerable influence over the time of ripening. Early kinds planted on dry, warm soils with southern exposure will mature several days sooner than otherwise; and late varieties on heavy soils with northern exposure, especially when kept well mulched, will be retarded.

CHANGES IN NOMENCLATURE.

It is gratifying to note that the names of fruits changed by the American Pomological Society are being generally adopted. In our last issue we gave those of the small fruits; the following lists comprise the changes in the leading tree fruits:

APPLES.

Name rejected.	Name adopted.
American Golden Pippin.	American Golden.
American Summer Pippin.	American Summer.
Caroline Red June.	Caroline June.
Chenango Strawberry.	Chenango.
Cooper's Early White.	Cooper's Early.
Cox's Orange Pippin.	Cox's Orange.
Danver's Winter Sweet.	Danver's Sweet.
Duchess of Oldenburg.	Oldenburg.
Early Red Margaret.	Early Margaret.
Hubbardston Nonsuch.	Hubbardston.
Jewett's Fine Red.	Jewett's Red.
Kentucky Red Streak.	Kentucky Red.
King of Tompkins County.	Tompkins' King.
Kirkbridge White.	Kirkbridge.
Large Yellow Bough.	Sweet Bough.
Marquis of Lorne.	Lorne.
Marston's Red Winter.	Marston's Red.
Otoc Red Streak.	Otoc.
Pleasant Valley Pippin.	Pleasant Valley.
Pyle's Red Winter.	Pyle's Winter.
Striped Sweet Pippin.	Striped Sweet.
Tewksbury Winter Blush.	Tewksbury Winter.
Twenty Ounce Apple.	Twenty Ounce.

PEARS.

Belle Epine Dumas.	Epine Dumas.
Beurre Bose.	Bose.
Beurre Clairgeau.	Clairgeau.
Beurre d'Amanlis.	Amanlis.
Beurre d'Anjou.	Anjou.
Beurre de Brignais.	Brignais.
Beurre Diel.	Diel.
Beurre Giffard.	Giffard.
Beurre Hardy.	Hardy.
Beurre Langelier.	Langelier.
Beurre Superfin.	Superfin.
Bonne du Puits Ansaull.	Ansaull.
Dearborn's Seedling.	Dearborn.
Doyenne Bonssock.	Bonssock.
Doyenne d'Ete.	Summer Doyenne.
Doyenne du Comice.	Comice.
Dr. Bachman.	Bachman.
Dr. Lindley.	Lindley.
Duchesse d'Angouleme.	Angouleme.
Duchesse de Bordeaux.	Bordeaux.
Golden Beurre of Bilbao.	Bilboa.
Jalonside Fontenay Vendee.	Fontenay.
Josephine de Malines.	Josephine of Malines.
Knight's Seedling.	Knight.
Louise Bonne de Jersey.	Louise Bonne of Jersey.
Nouveau Poiteau.	Poiteau.
Paradis d'Automne.	Paradise of Autumn.
Pelite Marguerite.	Margaret.
Supreme de Quimper.	Quimper.
Triomphe de Jodoigne.	Triumph of Jodoigne.
Viear of Wakefield.	Viear.
Winter Jonah.	Jonah.

PEACHES.

Amsden's June.	Amsden.
Ansteth's Late Red.	Ansteth's Late.
Cole's Early Red.	Cole's Early.
Cook's Late White.	Cook's Late.
Crockett's Late White.	Crockett's Late.
Early Albert.	Albert.
Early Beatrice.	Beatrice.
Early Louisa.	Louisa.
Early Rivers.	Rivers.
Early Tholston.	Tholston.
Harker's Seedling.	Harker.
Hoover's Late Health.	Hoover's Health.
Van Zandt's Superfin.	Van Zandt.
Ward's Late Free.	Ward's Late.

CHERRIES.

Blaarreau of Mezel.	Mezel.
Early Purple Galigne.	Early Purple.
Empress Eugenie.	Eugenie.
Knight's Early Black.	Knight's Early.

DWARF PEARS.

In reply to the inquiry whether Dwarf Pears can be grown successfully in a drained swamp, *P. T. Quinn says in the N. Y. Tribune*: "When swamp-land has been thoroughly drained, worked, and manured sufficiently to make it pay for market gardening, there is no doubt that dwarf Pears will grow freely and thrive for a time on such a soil. But it should be constantly kept in mind and practically carried out, that the soil must be kept free from stagnant water and in good heart. It is also necessary that the trees be planted with care and judiciously pruned at the time of planting. If it were a question between upland and well-drained swamp-land, the practical Pear-grower would always choose the upland situation, other conditions being equal. There is always more or less danger of getting a late succulent growth of young wood on swamp-land that is rich and moist, especially when the soil is fertilized with unfermented manures. Besides, there is something to be feared from late frosts while the trees are in blossom, on such low, damp places. But these drawbacks are not formidable enough to prohibit planting Pears with fair prospects of profit on such land, provided a good selection of trees and varieties is made.

"This brings us to the most important consideration in laying plans for planting a Pear orchard—the choice between dwarfs or standards. To treat this question intelligently, it will be necessary to refer briefly to the history of Pear culture in this country. A quarter of a century ago the opinions which found their way into print on this subject, in nine cases out of ten, emanated from nursery-men, and the exceptions to this rule came from those who took their keynote from the same source. Now, every practical man knows that it is much easier and very much cheaper to grow dwarfs in the nursery than it is standards. This uniform and rapid growth of dwarfs in the nursery, putting aside the larger profits, led nursery-men to advocate the planting of dwarfs in preference to standards for orchard purposes, and, as a natural consequence, dwarf Pears were planted extensively in every section of the country, on the recommendations from the sources named. As a matter of course, time and practical experience were essential elements to test this important question.

"I was one of the thousands who were led to plant dwarfs on an extended scale, and new, with an experience of twenty-five years in growing Pears for profit, and having during that time an unusual opportunity for observation both in this country and Europe, I can speak with some authority on this subject.

To be brief in summing up the case, I would simply state that if I were about to plant a Pear orchard now, and could get dwarf trees for nothing, and I was compelled to pay five hundred dollars a thousand for standards, I would not hesitate a moment in making the selection of standards. The tempting theory that dwarfs will bear fruit in a couple of years from the time of planting is a dangerous and bad theory to practice. A Pear tree should not be allowed to bear any fruit until it is five or six years in place, and one healthy standard Pear at twelve years of age is worth a dozen of dwarf trees kept as dwarfs at the same age."

NEW SEEDLING LIME.

Our illustration shows a natural-size representation of a new seedling Lime which has recently been raised in southern California. It is supposed to be a cross between a Lime and a Lemon, as it partakes somewhat of the characteristics of each. The fruit is a little larger than the ordinary Lime and milder flavored. The tree, or bush rather, is highly ornamental in appearance, more so than any of the Citrus tribe, thus making it doubly valuable. So far, Lime culture has made but little progress in California, as the trees are more tender than the Orange, but experiments in grafting them on the latter have shown that they become hardier by the operation. For southern Florida, below the frost line, Lime culture may offer a promising field.

STORING APPLES.

We (the writer does not constitute the whole firm) have always kept Apples largely over winter, and not infrequently till Apples came again. We have been very successful in preserving them in good condition. Our plan is this:

We pick the Apples as soon as they are ripe in the fall, and are always careful to put no bruised ones among those we intend to keep over winter. Some varieties are more easily bruised than others and must be handled carefully. Apples are not so apt to be bruised in picking as in handling afterward. As straw in the measures is a source of continual annoyance, we tack cloth or a couple of thicknesses of leather over cotton in the inside of the measures, to prevent bruising when the fruit is handled.

As soon as the Apples are gathered they are put in heaps in the orchard and there left till there is danger of their being frozen. The most important point in the preservation of Apples is to keep them dry, and we do not forget this when heaping them in the orchard. Boards are laid upon loose cross-pieces to make a floor. Upon the boards is put a light layer of straw. Boards are laid against stakes driven at the sides, and after the Apples are put in (not more than eighteen inches deep) a tight board roof is placed over them, but raised six inches from the Apples, to admit plenty of air getting to the Apples. Apples can be stored in a vacant corn-crib, clean stock shed, or under any airy shelter, but we find it more convenient to thus heap them up in the orchard. Wherever placed they must not be put upon the ground, and the floor upon which they are laid must be fully six inches from the ground, to prevent the fruit from drawing moisture. When Apples are stored they pass through a "sweat," and must not be disturbed while in this sweat.

When there is imminent danger of their freezing we bring them from the orchard and

store them in the cellar, putting them in bins raised at least a foot from the floor. The cellar is dry and well ventilated, and kept at as low a temperature as dare be. No straw is used in the bins. If we desire to keep the Apples till June or July we sort them over every two or three weeks after April 1. They do not begin to rot till that time, and if the rotten ones are kept picked out very few of such Apples as the Ben Davis will rot before June. They come out fresh and solid in the spring, crisp and juicy, and more palatable than in the fall.

We have tried burrowing Apples, but do

spring such lots were apparently in good condition, and they were put upon the market; but they perished soon, and losses occurred to the purchasers. I have noticed this always; and I have frequently heard farmers, who stored their home supply of Apples in pits, remark that the fruit began to rot as soon as the pit was opened in the spring. I do not know how to account for this unless it is because the Apples are kept damp, and I have found, as before stated, that dampness decayed Apples more than anything else. In a pit they are kept quite damp, as any one who has pitted Apples knows; for no matter when the pit is opened the Apples will be found quite wet. Apparently they absorb moisture, and this increases fermentation when exposed to the air. They do not rot while in the pit because the covering of straw and earth is almost impervious to air, and the Apples may be said to be canned up.

JOHN M. STAHL.

PEAR BLIGHT.

In a recent bulletin of the New-York Experiment Station, Professor J. C. Arthur, the Station Botanist, gives the results of his experiments with Pear blight, which, although not yet conclusive, throw a great deal of light upon the nature of this destructive disease.

The most remarkable results yet secured were obtained by inoculating the fruit of the Bartlett Pear with a watery infusion of diseased Pear stem. On the sixth day they were all blackened for some distance around the point of inoculation, and exuding a copious flow of yellowish fluid, which ran down the side and dropped on the ground. In fact, each was a great running sore. Upon cutting open the Pears, they were found to be discolored almost throughout their interior. Inoculation, at the same time, on Quince fruits showed the disease in seven days, but without any exudation, and upon cutting them open, only about one-fourth the interior was affected.

As a general statement,

which is fully sustained by the experiments so far tried,—some sixty in all,—the professor holds that the disease known as Pear blight is infectious, and may be transmitted from one tree to another by inoculation.

Under the microscope, any bit of diseased tissue shows inconceivable myriads of minute bacteria, which fill the water of the slide in which it is mounted, like a cloud. It is, therefore, not necessary to depend on external appearances in order to determine the progress of the disease in a branch, for the microscope will decide with absolute certainty. There cannot be a rational doubt that bacteria are the cause of this disease of the Pear and other pomaceous fruits.

NEW SEEDLING LIME.

not like the burrow so well as the cellar. We made the burrows by digging wide trenches a foot or more deep; putting the Apples in a pointed, continuous heap, and covering them with a light covering of straw and a heavy one of soil. The Apples wintered very well, but soon rotted when brought from the pit.

I notice in the report of the last meeting of the American Pomological Society that the Kansas orchardists have learned this in the bitter school of experience. On account of the heavy crop and low prices of 1882, many orchardists, not prepared with suitable conveniences, adopted the method of storing out-of-doors, protected with straw and dirt. The reports state that when opened in the

The Flower Garden.

FORGET-ME-NOT.

I set a slip out in the brook,
And lo! it grow, and spread and grow,
Till, by the sun and moisture fed,
It filled each winding curve and crook,
And blossomed into heavenly blue.

Out through the hedge it wandered then,
And filled with bloom the road-side stream;
Who now behold its wondrous hue,
And gaze into its starry ken,
Enraptured with its heanty seem.

"Forget me not!" the lover cried,
"For thee I meet a watery death."
He threw the blossoms to her side,
And, sinking, with his latest breath,
Cried still, "O love, forget me not!"

Thus christened was my lovely flower;
Baptized with love's delicious breath;
Albeit dearly sought and won—
And two fond hearts were from that hour
Asunder riven until death.

O precious flower! O sweet and rare!
Nurtured by stream and sun and wind,
And fed by grateful dews and showers,
Is this the secret of your power,
Which charms alike all human kind?

I watch the children come and go,
And older ones my blossoms seek,
Enchanted with their loveliness:
And as I see their faces glow,
I feel a joy I may not speak.

My tiny slip was planted well;
Its harvest hath been full of bliss;
So a kind word or deed may prove
A blessing unawares, and swell
The stream of human happiness.

Our lives are fraught with weal
and woe—
As gold is tempered with alloy;
And this is true, what else is false:
The sweetest joy that one can know
Is that of giving others joy.

[The author—whose name is not known to us—some years ago planted a few slips in a stream of running water. These grew and increased so rapidly that in three years they had followed the water-course for a considerable distance. "As I watch the children," he says, "gathering these incomparable blossoms, and see older persons coming from long distances to obtain plants for their gardens, and remember that all the plants which now give pleasure to so many came from the few slips set out by myself, I realize how much enjoyment one may find in contributing to the enjoyment of others."]

SEASONABLE HINTS.

Lilies may be planted in spring or autumn, but in our experience we have found the latter season decidedly preferable, with the exception of *L. auratum*, perhaps, which, unless the ground is very congenial, is apt to rot. The bulbs start so early in spring that they cannot always be planted soon enough. Lilies are so easily grown, and are so varied and beautiful, that we could never fully understand why a collection is not found in every garden. They thrive in any good garden soil, among perennial plants, in the mixed border, or in separate beds. The only condition which is essential to their success is never to have any standing water at their roots, especially during winter.

NARCISSUS.

There are in all about twenty species of Narcissus found in a wild state, mostly in different parts of Europe, and but very few in Africa and Asia. All of them are pretty and interesting, but the wonderful variety and beauty found in the cultivated Narcissus of the present day have been the result of careful and manifold hybridizations and crossings. The principal types of these are well shown in the accompanying excellent illustrations, for which we are indebted to Messrs. Woolson & Co., who make a specialty of this class of plants.

N. maximus, the Large Trumpet Daffodil.—Large bright yellow, very early; one of the best single varieties.

N. pseudo-Narcissus, Lent Lily, the com-

NARCISSUS MAXIMUS.

N. JUNCIFOLIUS.

mon Daffodil, or Daffodowndilly.—Yellow trumpet, sulphur perianth; found both single and double.

N. incomparabilis, Single Orange Phoenix.—Flowers large, primrose, with sulphur crown.

N. juncifolius, Rush-leaved Pyrenean Daffodil.—Flowers small, golden-yellow.

N. poeticus, Poet's Narcissus.—Flowers pure white, with a distinct red crown.

Nearly all the species and varieties are of easy cultivation and hardy here in the open ground; and it is a notable fact that, with the exception of *N. Bulbocodium* and its varieties, the bulbs grown in this country—although their cultivation has been undertaken but recently—are already rivaling the imported ones. It is, therefore, highly probable that, as is already the case with Tuberoses and Gladiolus, America will soon

be prepared to compete in these bulbs with European growers.

Narcissus succeed best in a rich, loamy soil, planted four to six inches apart, and the crown covered with three inches of earth. They may be planted at any time from September till the ground freezes, and it is best to let the bulbs remain in the same place for several years, to become well-established clumps; in fact, they need not be taken up at all, so long as the flowers are produced abundantly. Keeping the ground clean, and applying a good coat of well-rotted manure each fall, is all the care they require.

They are also excellently adapted for forcing, and may be planted in pots and placed in a cold frame or cool cellar, and brought into the house as needed for flowering. In potting, the neck of the bulb should not be entirely covered with soil, so as to admit sufficient room for abundant root-growth; otherwise the treatment does not vary from that of the Hyacinth and other Dutch bulbs.

MYOSOTIS.

The Myosotis, or Forget-me-not, is an old plant, and a favorite when grown well. But, like many other meritorious plants, we do not meet with it in the garden as frequently as we ought to. Its delicate blue color—a color somewhat rare among summer flowers—ought to give it a place in every collection.

It is a hardy perennial, and the seed can be sown in fall with perfect safety. If sown then, the plants will come into bloom early in spring, when we have few other border flowers.

It likes considerable shade, and on that account can be used where many other flowers would not flourish. I like it best when grown in beds by itself. It does not grow to any great height, generally from six to nine inches,—spreads considerably, and is a constant and profuse bloomer if kept somewhat moist. In exposed situations, during dry summers, I have never succeeded with it very satisfactorily.

But given some shade, and water if a dry spell comes on, it will please every lover of real beauty. It is not a showy flower, but the flowers which make the most show are not always the best ones. The flowers are borne in clusters, are star-shaped, and have white and yellow eyes.

M. palustris has flowers of a clear, porcelain-blue. *M. azurea* has flowers of a lighter blue, and is a finer variety.

The finest variety is *dissitiflora*, because it is such an early bloomer. The flowers of this section are very rich in color,—quite as much so as *Sabia patens*,—which is one of our very best blue flowers. It comes into bloom very early in the season, and can be made extremely useful on that account, in beds where other and later blooming flowers would be of no use. Last season I had a

circular bed of it, edged with pale yellow Pansies. The effect was extremely fine as the two colors harmonized well, and were in strong contrast to each other. Both were in bloom in May; and as both like shade to a considerable extent, they grew well together.

The Myosotis is useful for furnishing flowers for bouquets, its clusters being borne on stems which can be cut of any desirable length. Cutting does it good, for new branches are encouraged to grow, and these soon produce flowers.

A fine effect could be produced by using the Myosotis as an edging to a bed of pink and white Phlox Drummondii. The three colors would harmonize perfectly, and at the same time afford sufficient contrast to each other.

E. E. REXFORD.

THE SALVIA.

One of the very best flowers we have for use in the garden during the latter part of the season is the Salvia. It is a strong growing plant, with bright, clean foliage, bearing long spikes of very brilliant flowers. *Salvia splendens*, the old and well-known scarlet variety, is of a most vivid color. The only flower that can compare with it is the native Lobelia, or Cardinal Flower. Both are of a most intense color, and the Salvia takes the place in the garden which the other occupies in the wild-wood.

To grow it satisfactorily it must be started early, in the house, if possible; for if it does not come forward before cool weather sets in, it will not afford much pleasure, for it produces few flowers when small. At least such has been my experience with this flower. From plants set out in May, small plants, such as most florists send out, I have never had many flowers. The plants were generally full of buds when frost came. My plan has been to keep a plant over through the winter, in the house, and start new plants in March. These I keep growing as fast as consistent with health, until the weather becomes really warm. Then I put them out in light and mellow soil. I find the Salvia likes a rich soil, and one made light by the addition of considerable sand. Strong plants, set out in such a soil, when the weather becomes warm enough to keep them growing, will give flowers in profusion before frost. If set out too soon, they will be likely to receive a check from cold weather.

S. splendens is the most brilliant and dazzling variety. *S. patens* is a most exquisite blue. *S. marmorata nana* is a variegated kind, scarlet striped with white, very unique and showy, but not as desirable as either of the others.

The Salvia is a very desirable plant for use in the house during the winter. It blooms very profusely, and will afford the best of satisfaction in a mixed collection if you are careful to sprinkle it well, both on upper and under side of the leaves, two or three times a week, or oftener, to keep down the red spider, which is its worst enemy. So sus-

ceptible is it to the attacks of this pest, that the leaves soon turn yellow and fall off. I am greatly pleased with *S. Pitcheri*, a comparatively new variety. Its flowers are of a pale lavender blue, a color rarely met with except in the Agapanthus, Plumbago Capensis, and some of the Ageratums. It is a profuse bloomer, and the spider does not seem to like it as well as it does *S. splendens*. It is very useful in bouquets, as the color harmonizes so delightfully with pink, yellow, or white.

BALSAMS.

I can remember away back years ago when my grandmother's garden used to have a frame show every summer of Lady's-slippers.

They like a deep, rich, mellow soil, with considerable sand in it. They like plenty of warmth, and should be given a sunny place in the garden.

The foliage is apt to grow so thick along the stems as to hide the flowers considerably. This can easily and rapidly be clipped off by using shears, and then the flowers will have a chance to display themselves to advantage. On well-grown specimens, the branches will be so thickly set with flowers as to resemble wreaths put together by hand. We have them in many colors, all very delicate and beautiful: some are striped like Carnations, some are spotted, and others are of distinct colors throughout. For bouquets they can only be used in shallow dishes, in sand. They are most profuse bloomers, and make a beautiful bed. They are very easily grown, and any amateur can feel confident of success in cultivating them.

R. E.

POTTING CHRYSANTHEMUMS.

If you wish to bloom your Chrysanthemums in pots lift them during this month, preserving to them all the roots possible; put them into pots just large enough only to contain their roots, and use very rich, mellow earth. They will soon fill their pots in a root-bound state; then apply a surfacing of old rotted manure. Give them copious watering, two or three times a day, if they need it; never let them get dry. In lifting and potting Chrysanthemums or any other plants, it is well to observe that the greatest number possible of roots should be secured and saved.

In heavy, moist land, you may be able to lift your plants with balls of earth to them that you can pare down just to fit the pots into which you are to put them, and still your plants will wilt badly and lose their lower leaves. And why? Because in reducing the ball you cut off the feeding roots. It is the roots and not the earth you want. If the roots extend a yard, lift the whole mass, shake the loose soil away from them till you are satisfied you have reduced the mass enough to get it into the pot, then work in some fine mellow soil, and when finished, water copiously at the root and overhead. For some days, till the plants have recovered themselves, place them in a sheltered, somewhat shaded

place, not very close together, and shower them overhead two or three times a day to keep them from wilting.

GROWING WATER-LILIES.

If any one will put a half barrel in the ground, writes W. M. Bowrou, and connect with the overflow of a rain-water barrel, and plant in six inches of rich soil a root of *Nymphaea odorata*, and leave alone entirely, my experience is that a rich reward of blooms will be the result. In cold countries a few planks over the top during winter will be necessary. Conscience compels me to mention musquitos as the thorn to this aquatic Rose, but then it can be put away from the dwelling.

PSEUDO-NARCISSUS.

N. POETICUS.

N. INCOMPARABILIS.

I used to like them then because they were flowers, and because grandmother liked them; but I have a greater fondness for our Balsam of to-day, which has grown from the old Lady's-slippers, by the patient skill of florists, who really seem to perform miracles. The old kinds were single and small; the new kinds are double as Roses, and almost as large, and are most beautiful in color and variegation.

The Balsam is a tender plant, and the seeds should be started in the house, early in the season, though good results can be expected if the seeds are not planted until the season becomes warm enough to warrant planting the seeds in the ground. Balsams make very fine pot-plants for summer use.

The Window Garden AND GREENHOUSE.

FREESIAS.

Few new plants have gained so rapidly in popular favor as these beautiful Cape bulbs. Two years ago they were hardly known by name even to any one except botanists; while now a collection of winter-flowering bulbs is not considered complete without several pots of Freesias.

The bulbs are rather small, and half a dozen may, therefore, be planted in a six-inch pot, covering them with about an inch of soil. A rich, sandy, potting soil, as is generally used for Hyacinths and other Dutch bulbs, is also used for these. For early winter blooming, they should be planted this month, and by making subsequent plantings at intervals of two or three weeks, blooming plants may be had all winter. At first they should be kept cool and moderately moist until the leaves appear, when they have to be removed to a sunny window or other warm and light place, and watered more copiously. After flowering, they should be dried off, and not started again till the following autumn.

The graceful form of the flowers, as well as their exquisite fragrance, makes them very desirable for the window-garden, and their remarkable keeping quality, after being cut, adds greatly to their value for florists' work.

AUTUMN WORK.

During the summer months our windows are destitute of plants, and only Ficuses, Palms, Cycads, Aspidistras, and others that we use to decorate our tables, sideboards, and halls, find room in our houses. Until October, plants are generally better out-of-doors than in the house. But we should be careful to preserve them from frost, by covering them over with newspaper, cotton sheets, or other material, if they are still unpotted and growing in beds. But if they have been potted, we can, on the eve of a frosty night, remove them to the piazza or under the trees or bushes, and thus protect them against injury.

We should now conclude what plants we mean to winter over in our windows, and act accordingly. We need young plants of Abutilons, Colenses, Geraniums, Double Petunias, and others for next summer's garden; also Callas, Bouvardias, Carnations, and others to blossom in winter, and should have a place for both. But we should not try to keep more than our room will justify; better have a few good happy-appearing plants than a multitude so crammed together as to injure one another.

So long as the weather continues warm and genial, we should not mar our borders or beds by lifting those plants we wish merely to keep over for next summer's garden. But Bouvardias, Callas, Petunias, Sweet Alysium, Holiotropes, and Begonias, that we require for furnishing flowers in winter, should be lifted early and become well

established in their pots before cold weather sets in. Geraniums, Holiotropes, and many others may, after being lifted and potted, perfect the flower-buds then upon them; but, that done, they are not likely to bear any more till they have made fresh roots and started into fresh growth.

Tea-roses for winter and spring use had better be potted early and kept plunged out-of-doors in a sheltered place; if well rooted, a slight frost wont hurt them.

Tender plants, as Dracenas, Crotons, and especially those that have colored leaves, should be kept on the piazza, as cold, damp nights injure the tips of their leaves. Gloxinias, Achimenes, and Gesneras may be allowed to dry off preparatory to storing them part of the winter on a shelf in a warm, dry place. Musk may also be permitted to dry off before storing it in a cool place in the cellar; but it should not be kept dust dry.

CLUMP OF FREESIAS.

Madeira Vine, German and English Ivy, Cobaea, and similar vines, are pleasant in our windows in winter, and should be brought in readiness now. But if room is scarce for other plants, these vines can be dispensed with,—the Madeira Vine, like Potatoes, in the cellar, the English Ivy in a cool place there, too; the German Ivy, as a bunch of cuttings in a four-inch pot in the window; and the Cobaea thrown away—we can get it from seed next spring, plants that will grow twenty feet, and blossom from the end of July till killed by frost in October.

Chinese Primroses, Cinerarias, and Calceolarius love the cool, full weather, and now start into vigorous growth. Keep them cool, well ventilated, and copiously watered, and scatter some tobacco trash on the top of the soil in their pots, as a preventive of green fly and thrips.

Geraniums, Show Pelargoniums, Colenses, Iresines, Alternantheras, and other bedding plants that we wish for next year's garden, and cannot well raise from seed, should now be propagated from cuttings. Put six to ten in a four-inch pot, to stay there till next spring. A gentle hot-bed is an excellent

place in which to root cuttings of tender plants at this season; but if in a moderately sheltered and shaded place, and they are kept somewhat moist all the time, cuttings will root freely without any artificial heat.

Yellow and red Oxalises should now be potted and allowed to start slowly into growth. All kinds of "Dutch" bulbs, as Hyacinths, Tulips, and Narcissus, may be potted as soon as received, and kept in a cool place, as in a shady frame, shed, or cellar floor, and covered over with a few inches deep of coal ashes, sand, earth, or other material to keep the bulbs moist and cool and allow them to fill their pots with roots before they send up leaves or flowers.

WM. FALCONER.

CACTUS.

The Cactus family comprises some of the most interesting objects in the vegetable world. Not only are its members peculiar in their form of growth, but some of the species produce flowers of remarkable beauty. They, as a general rule, are easily cultivated, requiring during their season of rest little or no care; although, like everything else, a little extra attention bestowed upon them is amply repaid with more and better flowers than when the careless manner is adopted.

Being incapable of rapid evaporation of moisture from the surface of the stems or leaves, but little water is necessary during their period of rest, which in most of the species extends during the greatest portion of the year, the growth being made in a short period. It is necessary to grow them in soil sufficiently porous to allow a rapid passage for the water. For the strong-growing kinds, such as Cereus, a soil composed of turfy, sandy loam and leaf-mold, thoroughly rotted, is most suitable, and about one-third of the pot should be filled with drainage. To throw a handful of potsherds at random in the

pot, then the soil on the top, is not suitable for any kind of plants, more especially Cactuses and Orchids. Drainage should be well and carefully applied by placing regularly some large pieces in the bottom and smaller ones on top, then moss or some rough material over this, to prevent the soil from washing through, and thereby checking the flow of the water. A few pieces of broken pots or bricks mixed through the soil are also a benefit.

When potting the plant, do not cover up its stem with the soil, as when so placed it is apt to rot off just at the junction of the roots with the stem. After the plant is potted, place over the surface of the soil about a half-inch of clear sand, which prevents any decay of the plant and gives a cleaner appearance to it. When the growth approaches maturity, gradually withhold water to insure thorough ripening of the stems, as upon this depends the flowering of the plants.

Cereus is distinguished by its funnel-shaped flowers, having the long, numerous stamens attached to the base of the petals. Although comprising a great many species,

there are only a few suitable for general cultivation; the best of which are

C. MacDonaldia, a night-blooming species, the flowers of which are about a foot in diameter, red and orange sepals, with pure white petals. The stems are long and slender, a good kind for house or greenhouse culture.

C. grandiflorus is another beautiful night-blooming kind, having large creamy-white flowers, of free habit, and is easily grown.

C. Corderoyanus, a bright scarlet, on upright stems.

C. Gordonianus, a rose-colored kind, of easy culture.

C. crenatus, creamy-white, good form, and large-flowering.

C. Falen, a splendid flower, crimson, shaded with violet and orange.

Echinocactus, the Hedge-hog Cactus, is a large globular genus, thickly set with spines. Mostly natives of Mexico, they require plenty of sun when growing and plenty of water, but should be kept dry when at rest.

Melocactus communis, Turk's-cap Cactus, a South American species, often seen in cultivation. It has a large cylindrical portion on the top of the plant, when the flowers are produced, of a bright red color, like a fez cap; hence the name. A good window plant.

Pilocereus scnilis.—This is known under the name of Old Man Cactus, from its upright stem having a dense woolly head, looking like long white hair, flowing over the plant. As a curiosity for the window or greenhouse this is suitable. Keep in a sunny window at all times.

The genus *Epiphyllum* should not be forgotten in forming a collection of plants. Its free-flowering habit and beautifully colored flowers make the various species worthy of a place in every collection. Full directions for their culture, etc., were given in a previous number of THE AMERICAN GARDEN.

M. MILTON.

HEATING SMALL PLANT-HOUSES.

This subject is probably nearer to the heart of the amateur floriculturist than any other, and the difficulty of constructing a cheap, easily managed and regulated heating apparatus for small greenhouses or plant-rooms, deters a great many from cultivating house-plants, and thus making their rooms bright and cheerful during the winter months. Our esteemed friend, Dr. Edward Kittoe, of Galena, Ill., has constructed and used for several years an apparatus, which seems to answer its purpose better than anything else we have ever seen, and it is with much pleasure that we give the following descriptions, which he kindly furnishes for the benefit of the readers of THE AMERICAN GARDEN.

The heating apparatus proper consists of an ordinary oil lamp, marked O in our illustration; the chimney (C) is surrounded by the boiler (B); a supplementary boiler (S B), connected by three tubes with the main boiler, is placed above this, in order to utilize all the heat as far as is consistent with a due regard to the draft of the lamp. The boilers are connected with the main reservoir by two tubes, the upper one for the overflow of the hot water, and the lower for the return of the cooler portion to the boiler. In this case a ten-gallon tin oil can

serves the purpose of a tank. Any common kerosene oil lamp may be used. A lamp holding one pint and a half of oil was found sufficient for heating a bay-window 8 x 12 feet during cold nights, when the fire in the stove in the adjoining room was burning low.

Our second illustration shows a vertical section of a propagating tank, heated by a

DR. KITTOE'S LAMP BOILER.

lamp of similar construction. C represents the water-tank, D the sand of the propagating bed, and E the cover of the tank. The tank used by the doctor is 9 x 2 feet and twelve inches deep. The boilers may be of copper or tin, and can easily be made by any good tinsmith.

The uses to which such an apparatus may be applied are not confined to plant-houses only. By connecting the boiler with a suit-

CROSS-SECTION OF PROPAGATING BENCH.

able set of pipes it might serve an excellent purpose for heating an incubator, and for keeping frost out of cellars during extreme cold it seems admirably adapted. The great advantage of this contrivance over ordinary oil-stoves, in addition to its economy and simplicity, is that the lamp boiler may be so partitioned off from the plant-room that all danger from smoke and gases may be avoided.

PREPARING FOR WINTER FLOWERS.

With the waning summer heat and the approach of autumnal frosts comes the work of preparation of the winter flowering plants; for if good bloom and healthy leaves are wanted, the plants must be properly prepared for the purpose. Stove heat in a room where flowers are kept, especially when constantly maintained at a high degree, is one of the greatest hindrances to winter flowering.

The finest plants I saw last winter were placed in pots and window boxes, in a bay-window on the south side of a house. The curtain dropped from the top to the floor; there were no blinds, the curtains were constantly down in the day-time and raised at night; a flood of light reached the plants from all the sashes, which were often opened in mild weather from the top, while the room was heated by sunlight or an occasional wood fire in the small, open fire-place; but in mild

weather the room was kept comfortable for sewing and reading by heat from adjoining rooms.

It will be seen that the conditions were perfect for abundance of sunlight from the windows and change of air through the windows and fire-place. Any one who can provide the above conditions may have summer thrift in winter plants. In regard to preparing the few plants needed for such a display I will give a method which, with me, gives good success.

Petunias slipped now will make thrifty young plants to pot for fall and winter bloom, especially the double white, pink, and crimson; these, with the fringed, make a good assortment.

The Scarlet and Lady Washington Geraniums, slipped in common earth now, will produce fine bloom in early spring, while the old plants, if lifted early, will recover in season to bloom during winter.

Heliotropes lifted, cut back, and the slips rooted in sand or earth, will bloom all winter. A knife run deeply around a plant some time before lifting will prevent its wilting too much, and will often obviate the necessity of cutting it back.

Carnations cut back will recover to bloom in midwinter and spring, while the slips set this spring in the open ground or plunged in pots will be full of vigor, and bloom in early fall and winter.

Callas, divided and set in the open ground in spring, will first die down, but afterward make a vigorous growth, and when taken up and potted again in the fall will recover and bloom in early winter, and if kept cool for a while in a light cellar, may be retarded till Easter.

Roses carefully tended in pots in summer in the open ground, cut back and kept at rest during early winter, bloom in the spring.

Nasturtium, *Icies*, and other plants for hanging baskets and vases should be well started early in the fall, so as to produce a good effect as soon as placed in the house for winter decoration.

The plants mentioned are common, within the reach of all, and when well managed give great satisfaction in perfume, bloom, and color, all winter. My experience is that a mass of roots in healthy condition, in a rather scant amount of earth, if properly watered gives the best bloom. The soil I use is compost from my hot-beds; this is rich in decayed animal manure, well mixed with the original soil by several years of use.

The nearest approach to it in a manufactured soil, so to say, if such compost could not be obtained, would be rotted sods or leaf-mold mixed with some naturally rich soil; and a small proportion of commercial fertilizer such as is sold in the stores as plant food; prepare it by mixing as long as possible before using.

W. H. BULL.

WATERING PLANTS.

Plants may be watered at any hour of the day, except when the sun is shining on the pot, or has just left it; for the earth gets hot when the sun shines on it, and then, if cold water is poured on it, it will cool off too rapidly. The best time for watering flowers in summer is the evening, and in winter noon is best. Rain water or brook water is always preferable to well water.

Lawn and Landscape.

PRUNING LAWN AND FOREST TREES.

TIME TO PRUNE.

This is a subject which has been frequently discussed among arboriculturists and all who cultivate trees of any kind; but all will agree that it should never be done at a time when the sap will flow from the wound, as this not only causes a loss to the tree, but the slowly oozing sap has a corrosive action on both the exposed wound and surrounding bark, often hastening decay. This is especially true with trees like the Maple, Butternut, and Birch, which bleed (as it is termed) if wounded at any time during the latter part of winter or early spring. The oozing sap also attracts certain insects, especially those that infest dying or dead wood.

In my own experience I have never found any better time to prune than in summer, as soon as the trees are in full leaf, and have commenced to make a new growth. The wounds made at this time will commence to heal over immediately, and, when small branches are removed on rapidly growing trees, the wounds will usually be entirely covered with new wood by the end of the season; and where larger branches are cut off, the exposed wood will become well seasoned, and so hardened during the warm weather that it will seldom commence to decay before it is entirely overgrown.

The next best season is in the fall, after the wood is ripe; for in cool climates the exposed wood will become dry and hardened before the sap commences to flow in spring.

PRUNING EVERGREENS.

The Conifers and other evergreens will submit to the knife and pruning saw as well as deciduous trees, and when raised for timber will need pruning as often and in about the same manner. When raised for ornamental purposes, the pruning will be mainly for the purpose of giving them the required form, although thinning out and shortening the branches at the time of transplanting is as beneficial as it is with deciduous trees; but it is not so generally practiced. Evergreens may be headed back or trimmed up, in order to make them grow tall and slender or broad and stocky.

With the natural conical-shaped evergreens, like the Spruces or Balsams, many persons dislike to cut the leading shoots, for fear of destroying the natural symmetry of the tree; and while it may have this effect for a short time, a new leader is certain to come in and take the place of the one removed, but during the time intervening, the lateral branches will spread out more vigorously, giving to the tree a more stocky appearance.

In pruning the coarser-growing Pines, a little more care is required than with Arborvitæ, Spruces, and other closely allied trees, for the reason that buds are not usually produced on the internodes between the nodes and joints; and when a leading shoot, either the terminal one on the main stem or branches, is removed, it should be cut out close down to the junction of the next tier of branches below, leaving no barren stump to die and decay. A glance at a Pino-tree will

be enough for even a novice in such matters, to see how it should be pruned in order to make it grow more compact and stocky, if such a change is desired.

IMPLEMENTS USED IN PRUNING.

The common pruning-knife is the best implement for pruning small trees, but in removing large branches, a fine-tooth saw should be used in preference to an ax. If the wounds made are so large that they will not soon be covered with a new growth, it is well to apply some kind of wax, paint, or some other substance, to exclude water and prevent decay. Various compositions are used for this purpose, and on small trees, where the exposed wood can be readily reached, a little melted grafting-wax, applied with a brush, will be found an excellent preservative, but on large trees, where there is considerable surface to be covered, almost any good mineral paint mixed with linseed oil will answer every purpose.—From A. S. Fuller's *Practical Forestry*.

AUTUMN PLANTING.

If due regard be paid to the nature and requirements of trees and shrubs, says Donald McDonald, in *The Practical Gardener*, it will be readily seen that the autumn or fall of the year, when all deciduous kinds have shed their leaves, is the most appropriate period for transplanting; while evergreens will succeed better if moved earlier, in order that the warmer soil may assist the roots to become more quickly established in their new abode, and thus sustain a little renewed vigor before the severity of winter is felt. The benefit of this will be seen in the following spring, as soon as that season allows of an active growth to develop.

To insure the best results, it is necessary that the ground should have been previously well drained,—a very important feature in shrubberies particularly,—as a wet position or sodden soil will destroy the healthiest specimens.

Taste and arrangement are features that should be actively displayed, as, without them, very little precision and judgment can be employed, and an unsightly appearance will be the result.

Discretion must be used both in taking up the trees and in planting them. When a tree is taken out of the ground for transplanting, it is certain that its roots are more or less temporarily injured; care must, therefore, be exercised, that all jagged and injured portions be neatly cut off, and that the hole is sufficiently large to admit the roots without further injury, such as cramping and twisting. In the case of shrubs, balls of earth should be secured, if possible, and the fibrous rootlets will soon push their way in the new soil; but with many kinds of trees that possess roots not so compact, a capital method of keeping them in as natural a position as possible, is to lightly scatter a few spadefuls of earth from the stem outward before the remainder of the soil is thrown in and trampled down.

In planting a clump or bed, tall and strong-growing kinds should always be placed in the background or center, as the case may require. Avoid planting too thickly or too deep; both faults frequently occurring in the amateur's garden. Always keep the stem in an upright position, as nothing looks

more unsightly than a newly planted tree lying over in a slanting position. If the stem is weak, a stake should be used; but larger trees can be secured by attaching stout wires to their heads and securing them to pegs firmly driven into the ground a few feet from the stem. Three or four of these wires will keep a large tree firm and upright; but hay or other bandages must be used to prevent the wires from injuring the bark. This also applies to trees that are planted in positions much exposed to the wind. The stake should always be placed at the back of the tree. Do not allow the branches of one tree or shrub to touch those of its neighbor. On no account leave a mound of earth round the stem, as it not only gives an unfinished appearance, but is detrimental to the health of the tree; it assists to harbor vermin of all kinds, and prevents the rain from entering the soil.

To relieve any excessive bareness that may for the time exist between the trees and shrubs, Lilies, Dahlias, or Hollyhocks, if plentifully introduced, will be found useful, as the leaves of newly planted shrubs are seldom brought to perfection during the first year.

A note of importance that cannot fail to be of value to the amateur planter is the process generally adopted, after planting, of deluging the roots with a copious supply of water, especially if the ground is dry. This is particularly essential in the case of large evergreens. Mulching of the soil is also useful for retaining moisture, and syringing frequently prevents any serious drooping of the foliage.

TREE-PLANTING SOCIETIES.

The city of Brooklyn has an association that ought to be encouraged, the "Tree-planting and Fountain Society." Its object is to promote the planting of trees and the erection of drinking-fountains. Lectures are to be given on the subject of tree-planting, and to instruct the people as to the dangers that are incurred in permitting the forests of the state to be recklessly despoiled. The chief object of the society, however, is to beautify the city of Brooklyn by increasing its foliage. That is a worthy purpose, and one that can be advantageously carried out in a city of homes like Brooklyn.

The absence of all foliage from the streets of large cities is a great drawback to them in summer. Of course, in narrow streets trees are not desirable; but in the wide avenues of the newer parts of cities, which are chiefly occupied for residences, nothing imparts so much character of refinement and repose as graceful foliage of well-grown trees.

OUR PARKS AS EDUCATORS.

Few people can realize, said Central Park Commissioner Gen. Viole, that the public parks are great educational institutions. They clothe and refine the people. They affect not merely their bodies, but their minds and hearts as well. Take away the public parks, and New-York would become uninhabitable. Take them away, and we should have a riot here in a very short time. They are the cheapest moral institution in the city, for they save millions of dollars which would otherwise be spent in criminal courts and penal institutions.

Foreign Gardening.

SCHOOL GARDENS IN AUSTRIA.

The German word *Kindergarten*, as well as the method of instructing quite young children associated with it, is already tolerably familiar in this country. Briefly, it is an institution to assist in and complete the bringing up of children who are yet too young (three to six years of age) for regular school duties. True, it may include among its devices a tiny garden to promote observation and industry in its infant wards; but the school garden, as understood in Austria, is a real garden attached to a school, and forming part of the school. In an article, entitled "Der gegenwärtige Stand der Sache des Schulgartens," Mr. E. Schwab gives to the *Neue Freie Presse*, as reported by the *Gardener's Chronicle*, his ideas on the uses and scope of the school garden.

This is an institution of Austrian origin, and it is rapidly extending from country to country of that large empire. Thus in a small province 245 schools have gardens attached, thirty-six of which are worthy of notice. Moravia and Bohemia are active in the movement, and Galicia already possesses a considerable number in some of the provinces. The provinces of Mielec and Jaroslav are dotted all over with school gardens, each one including a neat little ornamental garden. In Styria a great many have been formed through the exertions of the Agricultural Society. In the capital little has yet been done in the matter, but they are established wherever the requisite space can be obtained. Seeds are supplied from the national botanic gardens, and suitable plans are furnished to any parish wishing to introduce the system.

The writer deprecates the plan of making simply useful gardens, and would have them include recreation grounds as well as ornamental features. In fact, with due regard to economy, the garden should be laid out with discernment and taste, in order to instill into the minds of the young scholars a sense of the beautiful. If instituted simply for the purpose of inculcating early habits of industry, it would doubtless prove a failure. Of course the design and arrangement should always be made subordinate to local conditions and circumstances.

Thus in a large town the requirements and the space generally available are usually widely diverse from those obtainable in a small country town. But even under the most unfavorable circumstances, the indigenous vegetation of the district should be illustrated, as well as the cultivated cereals, fodder plants, aromatic and medicinal herbs, vegetables and herbs employed in cookery, and fruits of all kinds. The poisonous plants, particularly of the neighborhood, should be cultivated in order to make them familiar to the scholars. Ornamental shrubs and herbaceous plants also deserve attention where there is room for them, and in larger gardens representatives of the native forest trees should be placed for shade on the playground.

The knowledge gained by children in this practical manner—and in a well-conducted garden it is varied and valuable—is permanent; they may forget what they learn, but not what they experience. One of the

principal advantages of this system, besides affording pure and healthy occupation and pleasure, is that under proper tuition it induces habits of observation and independent thought. Again, in towns it keeps children both from the evil influences of the streets, or those more inclined for study from shutting themselves up too closely instead of taking healthy exercise.

Where a garden is absolutely impossible, as in some towns, growing plants in pots in the yards and windows is recommended. There are doubtless almost insurmountable difficulties in the way of carrying the school garden into practice in many places in this country; but the need of some such purifying influence is painfully evident to those who come in contact with boys and girls whose only play-ground is the street.

DRYING TOMATOES.

In Italy an extensive business is carried on in drying Tomatoes to use during those portions of the year when the fresh fruit cannot be obtained. According to the *Rural Record*, Tomatoes are raised, for the most part, between rows of Grape-vines, so that the land of their culture costs nothing. Sometimes the Tomato-vines are trained on the lower bars of a trellis, to which the Grapes are attached. The Tomatoes are allowed to remain on the branches until they are quite ripe, when they are picked and pressed in bags made of coarse cloth, which allows the pulp to pass through, but which retains the seeds and skins. The pulp is then thinly spread out on cloth, boards, or in shallow dishes, and exposed to the sun to dry. When it has become quite dry, it is broken up fine, or ground, and put into boxes or bags and sent to market.

A large part of it is used for making soups, but considerable of it is employed as we do Tomatoes that are preserved in tin or glass cans. It is soaked for a few hours in warm water, and then cooked in the ordinary manner. Large quantities are wanted for home consumption, and considerable is exported.

This would seem to be a profitable industry to engage in in this country. There is great prejudice against canned Tomatoes, as many of them are unwholesome. The acid juice they contain unites with the solder of the tin cans and forms a compound that often causes severe sickness. The pulp of Tomatoes could be dried to good advantage in any of the styles of apparatus employed for drying Apples, Peaches, and small fruits.

MY BERMUDA PUMPKIN-VINE.

When I say that my Pumpkin-vine is seventy years old, and that I could make it grow in one continuous line from one end of the island to the other (twenty-four miles), I am stating a fact which would seem rather "fishy" to people living in a climate where the average life of a Pumpkin-vine is about five months. I found my vine running over my garden when I took possession of my place, and my colored gardener, who had lived on the place, boy and man, bond and free, for over seventy years, said the vine had been there as long back as he could remember, and that it was a valuable kind.

The only "hitch" in my story is that the

vine is not a Pumpkin-vine at all, but a hybrid Squash, which, in its many years of existence in a tropical climate, has formed the habit of sending out roots at each joint, so that as it advances in its growth it dies away behind after having perfected Pumpkins. I allow the vine to grow over a share of my garden during the summer months; and as September approaches, when I want the garden for my winter vegetables, I turn one end of the vine toward the border, and carefully conduct its growth to the fence and through into the pasture beyond, where it takes care of itself during the winter. I then gather the Pumpkins from the garden, store them away in a dry place,—where they will keep six months or more,—spade up the garden, and plant other vegetables.

The vine will not fruit in the winter months, as the temperature is too low (down in the sixties); but when the warmer days of April come to us, and the vegetables in the garden begin to fail me, I turn the vine which has wintered in the pasture back toward the garden, and as soon as it touches rich, freshly spaded earth, you can almost see it grow, and in a few weeks the garden is covered again. The seeds of this Pumpkin will grow and keep up the habits of the parent; but I have always found the seedlings do not produce as good fruit as the old vine, so I stick to the old love. The Squashes of the North do well, especially the Hubbard and Perfect Gem; but I have to plant seeds each year, as the vine dies in August.—*Russell Hastings, in N. Y. Tribune.*

A FAMOUS ROSE-BUSH.

The celebrated Rose-bush of Hildesheim, in Germany, which is said to be a thousand years old, and is reputed to have been planted by Charlemagne, has this year been covered with an extraordinary profusion of blossoms—more, it is declared, than it was ever known to bear before. New shoots have been grafted on its stems within a few years, and have grown finely. The bush stands on the outer wall of the crypt of the cathedral, with branches reaching to more than thirty feet in breadth and nearly thirty-five feet in height.

ORCHID CULTURE IN ENGLAND.

The following three cardinal points are considered by *Mr. Lucien Linden* as the most important requisites in Orchid culture:

First. The use of rain water.

Second. The employment of shading only when the sun burns, and then the light should be allowed to fall through open canvas netting.

Third. Abundance of air, even in frosty weather, when the ventilators should be opened and heat raised in proportion.

BLUE GUM-TREES IN IRELAND.

Blue Gum-trees, *Eucalyptus globulus*, have been growing for thirteen years on the estate of Lord Maurice Fitzgerald at Johnstown Castle, Co. Wexford. They had attained a height of sixty feet when they were killed by the recent hard winters. They can therefore not be considered hardy in that isle.

Rural Life.

HOMES IN THE COUNTRY.

The tendency of our steadily increasing population, especially in the East, is more and more toward the already crowded towns and cities, rather than toward a fuller occupation of what Dr. Holmes calls the unpaved districts, and this notwithstanding the fact that according to modern and popular standards of progress and culture there has been relatively far greater improvement in country than in city life during the past fifty years.

The opportunities for social intercourse, for keeping abreast of the times, for the best intellectual training, for all the minor comforts and conveniences of daily domestic life fifty years ago, were scarcely inferior to what they are at present.

The market was across the way for those who chose to live near it, and the bakery was around the corner; the huckster cried aloud in the streets and the organ-grinders dispensed the most catching operatic airs under the window. The concert-room, the lecture-hall, and play-house were within easy reach, and although sectarian lines were drawn with more or less rigor, there was a great variety of churches from which to choose. The latest fashions in dress were displayed in the shop windows, and the latest news from the seat of government or the seat of war was disseminated in a few hours after its arrival within the city limits; water and gas flowed freely, and the saloons and the police stations were all too familiar; livery stables abounded and picnic excursions were not unknown.

These and kindred privileges and blessings were confined more strictly to the city in former years than at present, and country dwellers obtained their knowledge of the outside world—that is, of the world that lay beyond “the visual line that girt them round”—by proxy. They must learn of its works and ways, its fashions, follies, and crimes, its opinions, its tricks and its manners, through some favored or enterprising member of society who had gone forth to see and explore. Now a few hours' time and a few dollars' outlay will enable each one to make his own explorations. There is not a remote corner grocery that may not have the news from Washington or London as promptly as the President or the Queen; not a farmer, fisherman, or mechanic who may not know the current price of his product or his labor; not a maiden among the Green Mountains of Vermont or the savannas of Georgia who may not for sixpence have the latest fashions, samples and all, direct from Stewart's or White's.

It will doubtless be a long time before the country will be as attractive to the majority of men as life in town; but as its advantages grow more and more apparent and its disadvantages diminish, as the country grows more beautiful and productive, owing to thorough, scientific cultivation, it will be strange if rural homes do not come to be reckoned more and more desirable. Of these there are two distinct types, the most common at the present time being those which are built and maintained from without, which are in effect suburban homes, although they may be a primitive Sabbath day's journey from any

large town or city, and they are not dependent for their essential comforts and conveniences upon the soil on which they stand.

Country homes of this sort are doubtless increasing as the ways and means of getting back and forth from them, to the centers of trade are made more swift and certain. But the othersort, the agricultural homes, or those that are fed and maintained in some way by what can be drawn from the earth itself, do not thrive to a great extent in the East. The opinion that the farmer's life in New England is one of unrelenting and almost unrequited toil and privation for himself, his wife, and his children, for his non-servants and maid-servants, his cattle and oxen, still prevails in spite of high prices, good markets, and the great advance in agricultural knowledge and facilities for doing work.

Doubtless, common sense will ultimately prevail. Every recurring period of hard times throws more or less men back to the first principle of earning a living by the sweat of their brows, and every demonstration of the wisdom and profit of strictly scientific farming attracts still others to this most ancient and honorable calling,—ancient surely, but honorable only as it is intelligently followed.—*The Builder.*

Exhibitions and Societies.

GLADIOLUS EXHIBITIONS.

Private Flower Exhibitions are steadily increasing in New-York City, and being held down-town in the most frequented business quarters of the city, are visited by many persons who could not, or imagine they could not, afford the time to attend the monthly exhibitions of the Horticultural Society. The exhibitions of P. Henderson & Co. and Young & Elliott were unusually fine, and many visitors had, no doubt, never before seen such a display; yet both of these were excelled by that of B. K. Bliss & Sons. *The New-York Tribune* says of it:

“A stream of visitors kept passing in and out of the warehouse of B. K. Bliss & Sons, 34 Barclay St., yesterday. Business men, walking by, were attracted by the perfume of flowers, and willingly accepted the invitation posted on the door to step in and view a floral exhibition. No expense has been spared to make the collection of flowers as complete as possible, and as the climatic conditions have for the past two or three months been exceptionally favorable, the exhibition is one of the best that New-York has seen. It includes many varieties seen in this country for the first time. A large bunch of white Tigrerias, placed between the red and yellow varieties, attracted much attention, and the collection of Hybrid Gladiolus is the largest and best in the country, embracing many new and rare varieties.”

The collection of Gladiolus comprised all the choicest new varieties, most notable among which were:

Baroness Burdett Coultz with flowers and spikes of the largest size; delicate rosy-lilac striped with purple.

Marie Berger, rose, carmine-flushed, shading into yellowish-rose; spikes very compact and closely set, more so than in any other variety we are familiar with.

Sea Foam, nearly pure white, probably the best white variety.

Africaine, of very peculiar slaty-brown color with white throat.

Leander, very large flowers, deep lilac shading into lilac, large, white throat.

Camelion, flowers very large, of peculiar grayish, lilac color, with cream-colored throat.

Dalila, deep, cherry-rose, large.

Lesseps, immenso spikes, rose, deep carmine striped.

The Blonde, an entirely new shade of buff and salmon pink, almost blonde.

Aurora, a very large compact spike, a very peculiar salmon-rose shaded orange and white striped.

Corinne, amaranth, shading to cherry.

Flamboyant, brilliant, flame red.

To name all the older and better known kinds would far exceed the space at our disposal. Among the hardy species and varieties were:

G. purpureo-auratus, *Froebeli*, *Lemoinei*, *cardinalis*, *John Thorp*, and many others. The last named is remarkable for its regular shape. Although Gladioluses were the leading feature of the exhibition, the fine collections of Lilies, Tigrerias, Dahlias, Phloxes, magnificent specimens of *Hyacinthus candicans*, *Eulalia zebrina* were not less attractive and admired by the many hundreds of visitors. The beneficial influence of such exhibitions cannot be overestimated, and it is, to be hoped that our seedsman and florists will find it to their advantage to hold similar special exhibitions of the leading classes of flowers.

NEIGHBORHOOD EXHIBITIONS.

Not far from this place, in an enterprising little village, the plan has been conceived of holding, at stated times, an exhibition of fruits, plants, and flowers by the young people. Small premiums are awarded to successful competitors, and a real genuine interest in the exhibitions is manifested. If a sufficient number of villages could be united in such a plan, and once a year have a general exhibit, good results could not fail to accrue.

By this means a love for flowers and their cultivation is established; and how rapidly this love grows when one is every day with them, watching and caring for them! It is a good thing to train young minds in the love of nature.

Moreover, by such exhibitions, where all the plants and fruits are carefully labeled, it makes it comparatively easy for our boys and girls to familiarize themselves with the correct names of the same. How many children (I will not say adults) can distinguish by their names a tenth part of the different varieties of Strawberries, Cherries, Pears, or Apples, and likewise the varied flowers about them in the fields, or, mayhap, in their gardens? To fasten these names indelibly upon the memory would be one object of these exhibitions. Then we should soon see a change about many a now unproductive yard, and in place of barren and unfruitful grounds we might hope to see flowers blooming and fruits growing, and with them an unconscious love in our own hearts for the beautiful in nature, expanding day by day.

J. W. DARROW.

Household Pets.

TAME ALLIGATORS.

In the sixth paper of Dr. Henshall's "Trip Around the Coast of Florida," he speaks of "Alligator Furgesson," who, in one of his yarns, remarks that he never killed a 'gator that measured over twelve feet in length. I would like to ask the reader what was the longest alligator known to have been killed?

I have three small tame alligators, which have been about a year in my possession. They are three feet long, and have grown six inches in that time. They are quite tame, and will come eagerly hustling along when I commence tapping on their box or calling them to feed. They are more spry than I would suppose possible. I have held a piece of meat over their box and have seen them jump so that their heads would appear above the box two feet high trying to get it. Putting one on the ground so as to give him a chance to run away, I have been surprised into a very fast walk to catch him again. When I stand and talk to them awhile they will rise on their feet, keep up a constant hissing and whisking of tails, as if they like to be noticed and talked to. Altogether they show more brightness and intelligence than I thought the species had.

I feed a little fresh meat twice a week in summer; in winter none at all, as they will not eat. At least these do not. Last winter I have several times found them frozen fast in the ice when the water was low in the tank. If large ones are correspondingly as quick and fierce as these little fellows, I should not care to be taken by one. Putting a small piece of meat on the end of a stick, I have several times had the stick twisted forcibly out of my fingers. They have a way of rapidly rolling over and over when they bite anything, until the piece is twisted out.

The little swamps had been dry so long that the water was all gone except in the alligator holes. I saw something swimming about in a little pool about six feet in diameter. I sat down on the sand bar thrown up around the hole, which had probably been there for years, the work of the alligator when digging the hole. Soon the nubby nose and little green eyes of a young alligator popped up; then another, until I counted six or eight. I was not more than four feet from the water, but, as I kept still, the little fellows did nothing but eye me sharply. Pretty soon I heard a strange clucking sound, and a big hunch of a nose and a pair of huge green goggle eyes were thrust up a little too close and familiar, I thought, considering the short acquaintance. I sat quite limber on foot, ready to take leave in case the old lady should harbor a notion to scoop me into the family circle. The stare of sixteen or eighteen eyes was embarrassing, as my audience seemed to expect something from me. Cautiously I backed down and out, and the audience suddenly and silently disappeared. I tried to snare the old one, but she pulled out of the noose I fixed, and was not at home for callers for several weeks. By fixing a saek under water and pulling a string, I closed the hole behind three of the little ones, which are the pets I now have; three feet each.

"KNICK," in *Forest and Stream*.

Miscellaneous.

THIS LIFE IS WHAT WE MAKE IT.

Let's oft'ner talk of noble deeds,
And rarer of the bad ones,
And slug about our happy days,
And not about the sad ones.
We are not made to fret and sigh,
And when grief sleeps to wake it,
Bright happiness is standing by—
This life is what we make it.

Let's find the sunny side of men,
Or be believers in it;
A light there is in every soul
That takes the pains to win it.
Oh! there's a slumbering good in all,
And we perchance may wake it;
Our hands contain the magic wand;
This life is what we make it.

Then here's to those whose loving hearts
Shed light and joy about them!
Thanks be to them for countless gems
We ne'er would know without them.
Oh! this should be a happy world
To all who may partake it;
The fault's our own if it is not—
This life is what we make it.

GROWING PLANTS IN MOSS.

Plants grown in moss have lately attracted considerable attention, and a special preparation, for which a Frenchman, named Dumesnil, has obtained a patent, has been extensively sold here as a wonderful discovery. This prompts Mr. A. S. Fuller to the following pertinent remarks:

"As we do not know the date of M. Dumesnil's patent, we cannot say whether he was first in the field or not; but we do know that Mr. Alfred Chamberlain, of Newport, R. I., obtained a patent for growing plants in baskets of moss, and a fertilizer, nearly or quite twenty-four years ago, and while visiting Washington with a specimen of his work, in 1861, he presented a handsome basket of Grapes growing in a wire basket to Mrs. President Lincoln. Mr. Chamberlain afterward exhibited various kinds of fruits raised in the same manner; even Peach-trees laden with ripe fruit were exhibited at horticultural fairs in New-York and Brooklyn. It is rather strange how soon a man and his works are forgotten; at least men will pretend to forget them when it is for their interests to do so.

"There must be, at this moment, hundreds of persons in this city and Brooklyn who remember the exhibitions of Mr. Chamberlain's fruits grown in moss-filled baskets, and the illustrations of them that appeared in the horticultural journals at that time; but, for some reason, none of his old contemporaries and competitors have seen fit to refer to them during the recent revival of this system of growing house-plants."

HAWAIIAN FLOWER-GIRLS.

The Hawaiians are passionately fond of flowers. Bevy of happy, rollicking native girls climb the sides of the mountains or explore the picturesque gorges in search of the choicest specimens, and, having gathered enough to supply the market for the day, they dash down to Honolulu, riding horseback, man-fashion, at a terrible gait. They are sure to bedeck themselves first with

"leis," or wreaths of flowers, which encircle their foreheads and hang suspended from their necks like so many necklaces glittering in the sunlight. Suspended from the neck, also, and flowing down their backs are great streamers of "maile" wreaths, plucked from a deliciously fragrant and perpetually green plant, without the aid of which no Hawaiian belle is robed in the height of fashion. Arriving in town the flower-girls select some shady nook along the public streets, sitting by the half-dozen or more, dexterously assorting the flowers, and making "leis" with great rapidity, and spreading them out fantastically, so as to attract attention and invite the public to patronize them by its most Platonic form, and their love-chants are usually successful in drawing custom. At the time that the famous Count Rochefort went through the Hawaiian capital, he was, while walking along, literally covered with wreaths by a charming native beauty.

THE WORLD SUPPLY OF AMBER.

This appears to be inexhaustible. The "blue earth" of Samland—the most important source of the supply—extends along the Baltic for sixty miles, and possesses a breadth of about twelve miles and an average thickness of ten feet. Runge estimates that every twelve cubic feet of this earth contains a pound of amber. This gives a total of some 9,600,000,000 pounds, which at the present rate of quarrying is sufficient to last for thirty thousand years. Amber is the fossilized gum of trees of past ages; and on the supposition that these trees had the same resin-producing capacity as the Norway Spruce, and that the amber was produced in the spot where it is found, Gœppert and Menge, in a new German work, estimate that three hundred forest generations of one hundred and twenty years each must have grown on the Samland blue earth to give it its present richness in this product. It is much more probable, however, that the amber came from a large area, and has been collected in its present position by the action of water. It is also probable that the trees were more resinous than the Norway Spruce.—*The Continent*.

FRIENDLY WORDS.

I find THE AMERICAN GARDEN a valuable guide for the garden.—G. B., *Richmond, Utah*.

YOUR AMERICAN GARDEN is so excellent, I wish all my friends to read it.—E. D. F., *Belair, Md.*

THE AMERICAN GARDEN is a handsome and admirable paper.—E. C. P., *Berkeley, Cal.*

I prize your paper very highly, and miss its timely suggestions when it does not come.—G. R. L., *Portsmouth, N. H.*

THE AMERICAN GARDEN, excellent as it is, improves constantly.—W. C. (F. R. H. S.), *Wantage, England*.

THE AMERICAN GARDEN is the best paper I ever saw, and I consider myself well repaid even without premiums.—E. P. B., *Shelbyville, Ky.*

Let me congratulate you on THE AMERICAN GARDEN; it grows better and better.—E. S. R., *Para, Brazil*.

THE AMERICAN GARDEN is so valuable a publication it should repay well all concerned.—J. W. C., *Brisham, Queensland, Australia*.

THE BANYAN-TREE.

(Ficus Indica.)

One of the most remarkable trees belonging to the genus *Ficus*—the six hundred species of which comprise climbing shrubs and trees of great diversity of character—is the famous Banyan, whose extraordinary habit of growth and enormous proportions so much astonish those whose idea of a large tree has been formed from what we consider giant forest trees. The Banyan, whose spreading, bowery roof, beneath which whole villages of huts find shade and shelter, is supported by gigantic pillar-like props, formed by descending aerial roots, which, on reaching the ground, assume the appearance and perform the functions of separate trunks.

The following extract from Tennant's "Ceylon" gives an interesting account of the peculiar habits of this tree, which in many parts of India is held sacred by the natives:

"As we ascend the hills, the Banyans, a variety of figs, make their appearance. They are the Thugs of the vegetable world; for, although not necessarily epiphytic, it may be said that, in point of fact, no single tree comes to perfection, or acquires even partial development, without the destruction of some other on which to fix itself as its supporter.

"The family generally make their appearance as slender roots, hanging from the crown or trunk of some other tree, generally a Palm, among the moist bases of whose leaves the seed, carried thither by some bird which had fed upon the fig, begins to germinate. This root, branching as it descends, envelops the trunk of the supporting tree with a net-work of wood, and at length, penetrating the ground, attains the dimensions of a stem; but, unlike a stem, it throws out no buds, leaves, or flowers. The true stem, with its branches, its foliage, and fruit springing upward from the crown of the tree, whence the root is seen descending, and from it issue the pendulous rootlets, which on reaching the earth fix themselves firmly and form the marvelous growth for which the Banyan is so celebrated. In the depth of this grove the original tree is incarcerated, till, literally strangled by the folds and weight of its resistless companion, it dies, and leaves the Fig in undisturbed possession of its place.

"It is not unusual to find a Fig-tree in the forest which had been thus upborne till it became a standard, now forming a hollow cylinder, the center of which was once filled by the sustaining tree, but the empty walls form a circular net-work of interlaced roots and branches firmly agglutinating under pressure, and admitting the light through interstices that look like loop-holes in a turret."

Deep twilight always prevails under the shade of the spreading foliage, through which not a ray of bright light can pierce, and the awe and dread with which the Buddhist villages regard this sacred tree is very intelligible. In the Wood Museum, at Kew, there is a fine specimen of a Palm trunk, upon which the strangling growth of a Banyan's roots is well shown. The remarkable way in which the roots become united to each other at every point where they touch is observable in the specimen just named.—*Scientific American.*

CURAÇOA.

Consul Barnes has written an interesting article from Curaçoa, which we find in the *Grocer and Canner*, in regard to that tropical island paradise:

"Curaçoa, the island containing the capital of the Dutch West Indies, is the largest of the islands, its length from north-west to south-east being thirty-six miles, its breadth about eight miles, and its area one hundred and sixty-four square miles. At no time is there sufficient forage produced to keep the animals in condition, because of the dry climate, and the forage is not such as to make the animals tempting food for the table. There are but two small streams in the island of Curaçoa, one issuing from a cave upon a plantation by the sea-side, and only sufficient for its use, and one, also small, issuing from the hills in the north-west and unoccupied end of the island. A rainy day is a meteorological phenomenon.

"The fruit product of Curaçoa shows much diversity, and in favorable locations in many varieties it is nearly perfection. The fruits can generally be depended upon for steady crops. The principal fruit, however, that has made the name of Curaçoa known to the world is the Orango grown there, *Citrus vulgaris*, there called Naranja cajera. Both the tree and fruit are small, and the latter is of a deep-green color. No other tree receives such care and cultivation as this. The fruit itself is only used, with syrup, to make a sweetmeat, or dulce, as it is called. The skins are what are harvested for a constant market. At that stage of development of the fruit when the rind contains a maximum of oil, the fruit is picked and peeled in quarters, and the quarters are dried and pressed, and packed in half barrels for export.

"The total product of the orchards in Orange rind is shipped to Amsterdam, and the price paid varies from 80 cents to \$2.00 per Dutch pound—a tenth more than the pound avoirdupois. By distillation the oil is extracted from the skins or peel, and is used to flavor the celebrated liqueur, "Curaçoa." As oil may be extracted from the skins of all kinds of Oranges, so they may be used to flavor liquors; and perhaps this accounts, to some extent, for the fact that "Curaçoa" is manufactured in Germany and France, and that the supply in the principal cities of the world is never behind the demand."

THE IMMORAL COCOA-NUT.

The worst thing about the Cocoa-nut Palm, says *Grant Allen*, the missionaries always say, is the fatal fact that, when once fairly started, it goes on bearing fruit uninterruptedly for forty years. This is very immoral and wrong of the ill-conditioned tree, because it encourages the idyllic Polynesian to lie under the palms all day long, cooling his limbs in the sea occasionally, sporting with Anaryllis in the shade, or with tangles of Nera's hair, and waiting for the nuts to drop down in due time, when he ought (according to European notions) to be killed himself with hard work under a blazing sky, raising Cotton, Sugar, Indigo, and Coffee for the immediate benefit of the white merchant and the ultimate advantage of the British public. It doesn't enforce habits of steady industry and perseverance, the good missionaries say; it doesn't induce the native

to feel that burning desire for Manchester piece-goods and the other blessings of civilization which ought properly to accompany the propagation of the missionary in foreign parts.

You stick your nut in the sand; you sit by a few years and watch it growing; you pick up the ripe fruits as they fall from the tree; and you sell them at last for illimitable red cloth to the Manchester piece-goods merchant. Nothing could be more simple or more satisfactory. And yet it is difficult to see the precise moral distinction between the owner of a Cocoa-nut grove in the South Sea Island and the owner of a coal-mine or a big estate in commercial England. Each lounges decorously through life after his own fashion; only the one lounges in a Russia-leather chair at a club in Pall Mall, while the other lounges in a nice soft dust-heap beside a rolling surf in Tahiti or the Hawaiian Archipelago.

CARNIVOROUS PLANTS.

Although physiologists have universally accepted the facts originally proposed by Darwin as correct, yet there has been a disposition in some quarters, says the *Gardener's Chronicle*, to question the fact, at least to doubt its utility. Mr. Francis Darwin undertook some experiments to satisfy the latter point, and now we have to record the results of some experiments made by M. Busgen. This gentleman commenced his experiments with seedling Droseras, and ascertained that the digestion of nitrogenous matter begins with the appearance of the first leaf. The experiments were continued for two years, with the result that those plants "fed" with nitrogenous diet in the shape of aphides and small insects were the more vigorous. Fourteen plants so treated produced seventeen flower-stalks and ninety seed-pods, while sixteen plants not so treated produced only nine flower-stalks and twenty seed-pods.

More conclusive still were the results of analysis, given in the *Annales Agronomiques*, which show for the first set a total weight of dry matter (remaining after the expulsion of water by heat) of 0.352, while the unfed plants yielded only 0.119 parts of a gramme.

POISONOUS COFFEE.

Most people think if they buy Coffee in the berry, roast and grind it at home, they are sure of having obtained a healthy article—the Simon-puro Java. But it may be they have been both deceived and poisoned. In Brooklyn, the *Scientific American* states, the health inspectors recently found several well-known coffee-dealers who were in the habit of doctoring cheap Central American Coffee, so as to make it resemble and sell for the true Java. This was accomplished by polishing the Coffee berries in rotating cylinders, with the addition of such stuffs as chromate of lead, Silesian blue, yellow ochre, Venetian red, drop black, burnt amber, charcoal, soapstone, chalk, and Prussian blue. Some of these substances contain lead, copper, and arsenic, and when the doctored Coffee was subjected to chemical test these metals were found in poisonous quantities. The Health Board promptly ordered the discontinuance of this mode of Coffee adulteration, to the benefit of the public.

MEASURING THE AGE OF TREES.

The counting of the rings added by exogenous trees every year to their circumferences can only, without risk of great error, be applied to trees cut down in their prime, and hence is useless for the older trees which are hollow and decayed. Trees, moreover, often develop themselves so unequally from their contour, that, as in the case of a specimen in the museum at Kow, there may be about two hundred and fifty rings on one side to fifty on the other. Perhaps the largest number of rings that has ever been counted was in the case of an Oak felled in 1812, where they amounted to seven hundred and ten; but Do Candollo, who mentioned this, adds that three hundred years were added to this number as probably covering the remaining rings which it was no longer possible to count.

The external girth measurement is for these reasons the best we can have, being especially applicable where the date of a tree's introduction into a country or of its planting is definitely fixed, since it enables us to argue from the individual specimen or from a number of specimens, not with certainty, but within certain limits of variability, to the rate of growth of that tree as a species. In these measurements of trees of a century or more in age, such as are given abundantly in Loudon's "Arboretum," lies our best guide, though, even then, the growth in subsequent ages must remain matter of conjecture. The difficulty is to reduce this conjectural quantity to the limits of probability; for, given the ascertained growth of the first century, how shall we estimate the diminished growth of later centuries? The best way would seem to be to take the ascertained growth of the first century, and then to make, say, the third of it the average growth of every century. Thus, if we were to take twelve feet as the ascertained growth of an Oak in its first century, four feet would be its constant average rate, and we might conjecture that an Oak of forty feet was about a thousand years old. But clearly it might be much less; for the reason for taking the third is not so much that it is a more probable average than the half, as that it is obviously less likely to err on the side of excess of rapidity.—J. A. Farrar, in *Popular Science Monthly*.

CATALOGUES RECEIVED.

Premiums, Rules, and Regulations of the Berks County Agricultural and Horticultural Society, at the annual Exhibition to be held at Reading, Pa., from September 23d to 26th.

Wm. Parry, Parry P. O., N. J.—Wholesale Trade Catalogue for Nurserymen and Dealers. Parry Strawberry, Wilson, Jr. Blackberry, Marlboro Raspberry, Kieffer and other Hybrid Pears, specialties.

Woolson & Co., Passaic, N. J.—Catalogue of Bulbs for Autumn Planting. A neat, tastefully illustrated pamphlet, containing a complete descriptive list of all sorts of bulbs and bulbous roots suitable for fall planting.

J. Walter Thompson, 39 Park Row, New-York.—Illustrated Catalogue of Magazines, compiled for the use of advertisers. A handsome pamphlet, containing, in addition to the lists, some valuable suggestions as to the circulation of papers, permanency, attractiveness, and character of advertisements.

Hale Brothers, South Glastonbury, Conn.—Summer and Autumn Price List of Pot-grown and Layer Strawberry Plants, with general List and Layer Small-fruit Plants. This is a most carefully selected list of the best varieties in each class, and the directions for planting and general management are practical and reliable.

OUR BOOK TABLE.

California, the Cornucopia of the World. A pamphlet published by the California Immigration Commission, 103 Adams street, Chicago, Ill., setting forth in glowing terms the commerce, manufactures, climate, lands, agricultural and other resources of the "Golden State."

Department of Agriculture.—Descriptive Catalogue of Plants in the exalt collection, prepared by William Saunders, Superintendent of Gardens and Grounds. This descriptive Catalogue, prepared for the purpose of serving as a guide to those who desire to inspect and study the plants in the conservatories of the Department, enhances considerably the value of these collections to the public.

Godey's Lady's Book for September presents special attractions. There are two excellent serials now running, and this month's installment is even more amusing than last month's. There are two capital short stories in this issue. Among the other attractions of the book is a fine steel-plate illustration of the story, "A Tempest Indoors," by Emily Lennox. The music, colored plates, and Presidential portrait are all excellent.

The attractions of this venerable magazine seem to multiply each month. *Godey's* will well repay perusal.

New System of Ventilation. by Henry A. Gonge, published by D. Van Nostrand, New-York. In this volume of nearly two hundred pages, the author demonstrates that ventilation apparatuses, as generally constructed, do not and cannot accomplish the objects for which they are designed, viz., the complete removal of the vitiated air and exhalations from a room as fast as they are produced, and the introduction of an equal volume of pure air at the same time. This seems to be fully accomplished by the new system. Suction pipes, located at the proper points, are so constructed that, by the use of a gas or oil flame, a current of air is created strong enough to remove any amount of air from the room. The thus expelled impure air is instantly replaced with an equal volume of fresh air, which, before passing into the room, may be warmed or cooled, as desired. Numerous descriptions of buildings in which this system is in successful operation show its adaptability to every conceivable structure requiring ventilation.

The Fallacies in "Progress and Poverty," in Henry Dunning Macleod's "Economics," and in "Social Problems," with the Ethics of Protection and Free Trade, and the Industrial Problem considered *a priori*. By William Hanson. Extra cloth, \$1.00. Fowler & Wells Co., publishers, 753 Broadway, New-York.

This is a bold attack by a candid writer on leading points and arguments made by Mr. Henry George, in his well-known "Progress and Poverty" and "Social Problems." Mr. Hanson is as radical as the Liquid Reformer himself, in his views of the fundamental changes necessary to true social progress. "The Ethics of Protection and Free Trade" constitutes one essay, in which the principles of the two great parties that stand arrayed against each other on the Tariff question are reviewed in the light of political responsibility and what constitutes true national progress. The work is written for the people, from the point of view of the practical man and Christian philosopher who is consciously radical, but seeks to make his every proposition for social reform based upon justice, and responsive to the simple demands of humanity.

Practical Forestry, a Treatise on the Propagation, Planting, and Cultivation, with a Description, and the Botanical and Popular Names of all the Indigenous Trees of the United States, both Evergreen and Deciduous, together with notes on a large number of the most valuable exotic species, by Andrew S. Fuller. Published by the Orange Judd Company, New-York. Price, \$1.50.

The want of a condensed and yet comprehensive work on the trees of the United States has always been seriously felt by every one interested in forestry, as well as in ornamental planting; and the reason why a book on this subject has not been published ere this can only be found in the fact that the number of persons capable of writing such a work is microscopically small, and among these no one is more competent to the

task than the author himself, through his life-long practical experience, careful observations, and rare scientific attainments alike. The chapters on Influence of Fruits on Climate, Characteristics of Trees, Raising, Transplanting, Budding, Grafting, and Propagating Trees, are models of concise, practical advice and directions. The chapter on Pruning, which we reprint on another page, may well serve as an illustration of the tone of the entire book. But by far the greatest value of the work consists in the alphabetically arranged descriptive list of trees, the most complete that has ever been published. The botanical as well as the popular names of each species and variety are given; and the descriptions, interspersed with many illustrations, are so accurate and vivid, that any one at all familiar with trees will find no difficulty in identifying most kinds. The uses of the wood, fruits, flowers, or other parts, are fully set forth with each species, as well as its value for forest or ornamental planting. To the tree-planter, landscape-gardener, and nurseryman this volume is worth many times its cost, while to the botanist and student of forestry it is invaluable.

[Mr. Fuller is now engaged in collecting material for a work on nut-bearing trees, and would be pleased to receive specimens of rare and unusual nuts of all kinds. Of course, he does not want common nuts that are found everywhere, but there are sometimes found single trees which vary considerably in the shape and size of their nuts, and otherwise from the typical forms. Any one having such specimens may add to the general knowledge of this interesting class of trees by giving an account of them and mailing specimens to Mr. A. S. Fuller, Ridgewood, N. J.]

The Orchids of New England, by Henry Baldwin, published by John Wiley & Sons, New-York. Price, elegantly bound, \$2.50.

The appearance of a work of this kind, intended not so much for specialists in botany as for intelligent readers of all classes, is a most gratifying indication of an increasing interest in the study of natural sciences; and no family of plants offers richer or more varied material to excite the interest of beginners than Orchids. Persons who associate Orchids with the heat and luxuriant vegetation of southern climates only, are made aware that within the area of New England not less than forty-seven species and varieties are found, which, although not of parasitic habit, and not as large-flowered and brilliantly colored as their tropical sisters, are in their structure closely allied to them. The synopsis given as an introduction to the work is so plain and concise, that it enables any one at all familiar with the structure of flowers to identify any species at sight almost. The principal part of the work consists in a special description of all the species, commencing with *Orchis spectabilis*, the earliest to flower, and closing the cycle with the fall-blooming *Spiranthes*. This discourse, however, is far from being simply a dry, scientific description, of interest only to the professional botanist; but in a most charming style, culled by many excellent illustrations, the author interweaves hundreds of interesting items of information about vegetable physiology, geography, mythology, poetry, etc., making its reading as attractive as a fascinating novel. This is followed by accounts of the experiences of several horticulturists in cultivating indigenous Orchids. A list of stations at which the various species are found, shows the range of each species through New England and, as far as possible, in each State, together with the degree of its abundance or rarity. This will be of great value to all collectors, although the author states that the pleasure in printing it is considerably lessened by the fear that he may be sounding the death-bell of some of the rarer kinds, and he advises the formation of societies for their protection.

The careful, painstaking work of the author, as well as the enterprise and liberality of the publishers, is highly to be commended. If this book could be placed in the hands of every graduate on leaving college, its reading would serve a better post-graduate course than anything else we can imagine. It would, no doubt, open a new and enchanting world to many; would interest them in the study of nature; educate them to the purest and most refining enjoyments, and develop them into nobler men and better women.

POTTED STRAWBERRY PLANTS.

(Ready Now.)
Not Mailable.
We believe in fall planting of all small fruits, and strongly recommend pot-grown strawberry plants for that purpose, as a fall crop of fruit can be had the following season by planting properly grown potted strawberry plants during the months of August and September. By properly growing two main plants that have been layered and rooted in pots for some weeks before setting out, thus forming root-balls that remain undisturbed and constitute the real advantage that this class of plants possesses over the common or layer ones.

- Atlantic (Now),** \$1.00 per doz.; \$4.00 per 100.
- Lavoy plants, 75 cents per doz., \$2.00 per 100.**
- Prince of Berries (Now),** \$1.00 per doz.; \$6.00 per 100.
- Lavoy plants, \$1.00 per doz.; \$3.00 per 100.**
- Bidwell,** Charles Downing, Duchess, Sharpless, Longfellow, Warren, Jersey Queen, \$2.50 per 100; \$1.50 for 50; \$1.00 for 25.
- Lavoy plants, 50 cents per doz.; \$1.00 per 100.**
- Varieties not named above will be put to order, at three weeks' notice.

LAYER PLANTS - STANDARD VARIETIES.

Layer plants, 50 cts. per dozen, 75 cts. for fifty, \$1.00 per hundred; ready September 15.

- | EARLY. | MEDIUM. | LATE. |
|--|---|--|
| Crescent (P), Crescent City, Duneau, Wilson. | Cumberland Triumph, Great American, Monarch of the West, Seth Boyden. | Glendale, Golden Defiance (P), Miner's Prolific, Mount Vernon. |

At the dozen rate, layer plants will be sent by mail, postage prepaid. At the hundred rate, if to be sent by mail, 50 cents per hundred for postage must be sent in addition to the price. Potted plants cannot be sent by mail.

PAMPAS GRASS PLUMES.

Beautiful silvery Plumes, 20 to 36 inches in length. The finest of all ornamental grasses for the decoration of Churches, Halls, or Dwellings. They retain their beauty for years. To develop the Plumes to their original size and beauty, they should be held before a stove, shaking them briskly at the time.

PRICES.

	Each.	Per doz.
No. 1, 30 inches and upward in length (exclusive of stem)...	.30	\$3.00
No. 2, 18 to 30 inches.....	.25	2.25
No. 3, 12 to 18 inches.....	.15	1.25

Prices for larger quantities on application. On account of their length, these cannot be safely sent by mail. Above prices are by express at purchaser's expense. They are shipped in pasteboard rolls, and, being light in weight, charges are not heavy.

Also, a full assortment of Ornamental Grass and Bouquets. Illustrated Price-List mailed free on application.

NEW RYE.—Thousand-fold.

The rapidly increasing importance of rye in many sections of our country where wheat culture is not found profitable, as well as the enormous demand for straw for manufacturing purposes, has induced us to import trials, we confidently recommend this superior to any of the older kinds. It grows from six to seven feet in height, with extremely large and heavy straw, holding up well its weighty heads without bending; it is long-jointed, bright, and clean, making it adapted to various purposes in that stalks which, by ventilation of their nature, combined with its remarkable after-ripening tendency, it is not rare in hard times and yield it is not exceeded by any other variety, being wintered splendidly in most severe seasons, producing from thirty to fifty bushels per acre, according to the character of the soil and seasons. See account of its luxuriant growth and profuse flowering, a quarter to a third less seed should be sown per acre than is used of less vigorous growing kinds. Price, 4 pounds, \$1.00, by mail, post-paid; per peck, \$1.00; half bushel, \$1.75; bushel, \$3.00. Bags, containing two bushels, \$5.50.

B. K. BLISS & SONS, 34 Barclay Street, New-York.

HYACINTH GLASSES.

As the season has now arrived when it is advisable to lay in your supply of bulbs for house and garden culture, it is proper to anticipate your necessities by purchasing glasses in which to grow Hyacinths, Tulips, or Crocus in water. We have a large supply of elegant patterns to which we wish to attract your kind attention. Among the many styles we offer are included:
No. 1 (see illustration), a beautiful light-colored glass painted with various graceful designs; 50 cents each; \$5.00 per dozen.
No. 10, a forcing glass of clear light; very long, allowing the roots full growth. Price very low: 10 cents each; \$1.00 per dozen.
Hyacinth glasses cannot be mailed. For a more complete list see our Bulb Catalogue, just issued.

A New Winter Wheat
WINTER PEARL.

This new and promising variety is the result of an experiment made by F. H. Horsford, of Charlotte, Vermont, in 1878, and is a cross between those two well-known wheats, the Diell and Clawson. The heads are beardless, regular, and very handsome, five and a half inches long, with eighteen to twenty breasts of four grains each. Kernels about the size of the Clawson, hard, plump, and of a light amber color. Straw from three to five feet high, brightly yellow, strong and elastic; tillers freely, forty heads having been counted from one kernel. It matures with Clawson, and has produced the past season (1883) in Northern Vermont at the rate of forty-five bushels per acre from one bushel of seed, and would doubtless have been even more productive in a better wheat country. Price: 3 lbs. by mail, \$1.00; per peck, \$2.50; per 1/2 bushel, \$4.50; per bushel, \$8.00.

Hardy Annuals, Biennials, and Perennials for Autumn sowing. Collections of 20 varieties, \$1.00.
These collections contain only such varieties, that, if sown during the months of August and September, and slightly protected during Winter by a covering of overgreen boughs, will bloom early the following year.

FREESIA REFRACTA ALBA.

For graceful beauty and exquisite fragrance, this important introduction promises to rival many an old-time favorite as a plant for parlor culture, while the ready facility with which it can be forced insures to the florist and others who need them, an abundance of cut flowers just at the time they are most valuable. The flowers are tube-shaped, pure white, blotched with yellow on the lower petal, and are borne on a slender branching scape, somewhat spreading, the strongest bulbs throwing a flower-stem about twenty inches in height. The foliage is narrow, growing flat, as in the *Ixia* and *Tritonias*, to which the plant has some resemblance. The perfume is most delicious, seeming to be composed of Mignonette, Jasmine, and Primroses,—differing from the majority of strongly perfumed flowers in that it is never objectionable. The culture is very simple. The bulbs should be potted during October, in any good soil of a sandy texture; water sufficient should be given to soak through, after which but sparingly until beginning to grow rapidly; then water freely and place in a sunny temperate position, either in the house or conservatory. After flowering is over, withhold water gradually, and when the bulbs have thoroughly ripened, store in some dry place until the next October. Price, 25 cents each; \$2.50 per dozen.

FREESIA REFRACTA ALBA.

Sedgwick Steel Wire Fence

Is the only general purpose Wire Fence in use, being a Strong Net-Work Without Barbs. It will turn dogs, pigs, sheep, and poultry, as well as the most vicious stock, without injury to either fence or stock. It is just the fence for farms, gardens, stock ranges and railroads, and very neat for lawns, parks, school lots and cemeteries. Covered with rust-proof paint (or galvanized) it will last a life-time. It is Superior to Boards or Barbed Wires in every respect. We ask for it a fair trial, knowing it will wear itself into favor. The Sedgwick Gates, made of wrought-iron pipe and steel wire, defy all competition in neatness, strength and durability. We also make the best and cheapest All Iron Automatic or Self-Opening Gate, also Cheapest and Neatest All Iron Fence. For Prices and Particulars ask Hardware Dealers or address the Manufacturers.

Route d'Heyrieux, No. 218.
MONPLAISIR—LYON—FRANCE.

PERPETUAL CARNATION SEED,

Just gathered on the latest collection. Will produce about 90 per cent. of double and varied varieties.
1,000 Seeds, 40 francs.
500 " 25 "
Sent, post-paid, for cash payment.

The American Garden

A Monthly Journal of Practical Gardening.

DR. F. M. HEXAMER, Editor.

B. K. BLISS & SONS, Publishers.

Vol. V.

NEW-YORK, OCTOBER, 1884.

No. 10.

OUR PREMIUM LIST.

We wish to draw the special attention of our readers to our large and liberal Premium List, on page 197 of this number. We are aware that some of our readers do not care for these presents, considering the paper fully worth its price, and good enough without premiums; yet others think differently, and will gladly accept a good thing when it may be had without cost.

But besides this, the seeds, plants, bulbs, etc., offered in our Premium List to subscribers and those who will assist in extending the circulation of our paper, are really articles of more than ordinary merit, and the bringing of them to the notice of those who would otherwise remain in ignorance of their existence is a not unimportant part of the object of THE AMERICAN GARDEN—that of distributing knowledge, and of developing and educating rural taste. Every progressive step suggests and indicates still further improvement, and leads nearer to perfection. It is therefore that we would much rather see all our subscribers avail themselves of the liberal offers made in our Premium List, and see for themselves that THE AMERICAN GARDEN furnishes not only mental, but also material aid to its friends.

PRESERVE YOUR PAPERS.

Hardly a week passes without receiving some inquiries about matters which have been fully discussed in recent numbers. While we are always glad to give all desired information as far as is in our power, it does not seem just toward the majority of our readers who preserve their papers for future reference to fill our pages with repetitions of what has already appeared but a few months ago. Those who do not keep their papers have evidently not considered how great and varied an amount of information is contained in a year's file. Together with the complete and carefully-prepared index, which is furnished free to every subscriber at the end of the year, the annual volumes of THE AMERICAN GARDEN form in

themselves a horticultural library, treating of every imaginable topic pertaining to Flowers, Fruits, Vegetables, Lawns, Landscape Gardening, and Rural Life in general. Do preserve your papers!

DON'T FORGET

that each member of a club for the premiums offered to subscribers to THE AMERICAN GARDEN for 1885 is entitled to any one of

RENEW NOW! SUBSCRIBE NOW!

Remember that every person sending a renewal of, or a new subscription to, THE AMERICAN GARDEN for 1885, NOW, is entitled to the remaining numbers for 1884, free of expense, also to any one of the premiums offered to single subscribers. Those who are already subscribers for 1884 may have the remaining numbers of this year sent to any address they may designate, free of expense.

OCTOBER.

The solemn fires are lit again
Upon the mountain's altar places;
They rise above the kneeling plain,
And front us with unchanging
faces.
The holy time of all the year
In silent worship there is flow-
ing;
The autumn festival is near,
The bright, October days
are going.

Their tokens shine along
the steep
Where every breeze is
shaking splendor;
And where the sunshine
lies asleep
On leaves with valley-
shadow tender.
Into October's vintage cup
The last and richest wine
is flowing;
And while the draught is
brimming up
The bright autumnal
days are going.

And but that every year doth hold
Its summer by a winter dard,
And every fiery autumn fold
A death beneath it, frosty-hearted,
Too perfect were those crowning days—
So rich the ebbing life is flowing;
Each dying in a sunset blaze,
The bright, October days are going.

And in his royal robe and crown
The year awaits the spoiler hasting;
And scarce will lay his glory down
Before the foe whose touch is blasting.
Too few the golden days, alas!
So much with them is outward flowing;
They take the sunshine as they pass—
Those bright, October days are going.

CARL SPENCER.

HORTICULTURAL INSURANCE.

Nearly every person believes in insurance of some form, Life, Fire, Accident, and the number of disbelievers would be still lessened were it not for the large premiums required to carry the policies, so large in some cases that many large corporations, owners of steam-ships, etc., prefer to carry their own risks rather than pay the large amounts required for premiums. If a company were established whose premiums were merely nominal, how it would be welcomed by the public at large.

THE AMERICAN GARDEN insures against losses in the garden, and may therefore, in some sense, be termed a Horticultural Insurance, with a merely nominal rate of premium. For one dollar a year—its subscription price—it insures to those who follow its teachings health and happiness, thrifty, vigorous plants, and freedom from the many accidents that constantly beset the path of the inexperienced horticulturist.

Try it for one year and see if your experience will not be similar to that of most of our subscribers who find enough information in many a single number to pay the cost of the paper for an entire year. See special offer on page 197.

FRIENDLY WORDS.

My success in gardening is principally due to the information derived from THE AMERICAN GARDEN.—N. T. L., Astoria, N. Y.

the premiums offered to single subscribers. This will be of great help to those soliciting subscriptions, as they will be able to promise a separate premium to every subscriber.

The Vegetable Garden.

SEASONABLE HINTS.

"Weeds will do no harm so late in the season," is a common saying with slipshod gardeners and farmers, and a most deceitful and mischievous doctrine it is, too. Weeds do harm to cultivated plants, at any and every stage of their growth,—the young ones, by depriving the growing crops of some of the most important elements necessary for their best development; and the full-grown ones, by ripening and scattering their seeds thousand, nay million, fold over the land. Actual count has shown that a single plant of Shepherd's Purse and Ox-eye Daisy produce nearly a hundred thousand seeds, Pigweed a million, and Purslane, alas! over two millions.

That with such a bountiful seeding-down to weeds a crop can be raised at all seems the most surprising part of it. We know very well—from a life-long experience in the garden and on the farm—that "not to let a single weed go to seed" is easier said than done; but unless one makes the attempt, he will surely never succeed. And, in order to succeed, it must be made a firm policy and fixed principle to wage a perpetual and relentless war against every weed, as much so as we would against scorpions and rattlesnakes. If carried out, there is the great satisfaction that the task becomes easier with every succeeding year. We know of some gardens—not many, to be sure—in which the plan is carried out, and as the result of which it seems that every trace of weeds has been entirely exterminated.

Parsley is used more for ornamentation of dishes than in their preparation, although its flavor in soups, sauces, salads, and various dressings is very agreeable to most persons, especially during winter, when Lettuce and other fresh relishes are not easily obtainable. In the Northern States the plant is not entirely hardy, but a light covering of leaves or straw, and a few branches on top, will preserve it so as to furnish a supply for early spring. For winter use, however, the roots have to be transferred to a warmer place before hard frosts occur. When the stock is sufficient, so that not more than one or two cuttings are required, a cold frame serves the purpose very well; but planted on the benches of a moderately warm greenhouse, it grows all winter, and may be cut half a dozen times.

A neat and pretty way is to plant it in a small keg, through the sides of which a number of holes have been bored. The keg is filled with rich soil, through each hole a root is inserted, and the remaining ones planted on the top. By keeping such a keg in a light kitchen window, giving plenty of water and an occasional dose of soap-suds, it will soon become entirely covered with foliage, present a bright, cheerful appearance, and furnish a never-failing supply of garnishing greens.

Asparagus may be planted at any time this month, provided the ground is well drained; otherwise it is better to defer planting till spring. Good, vigorous plants one or two years old, rich soil, and plenty of room are the main requisites for successful *Asparagus* growing.

DIGGING AND STORING ROOTS.

The harvesting of roots by the old hand methods—pulling and spading—is a slow and laborious task. To make root-raising profitable, most of the hand labor that was, and still continues to be, quite an impediment to the industry must be done away with.

Those roots that produce the main bulk of their growth above ground, such as the flat Beets and the Turnips, can be pulled by hand, and thrown into piles to be topped, about as cheaply as by any other method, but those that root deeply must be handled in some other way. Hand digging with the spado or shovel is too slow and expensive. The plow is an unwieldy implement for this work. I have used a home-made contrivance that performs the work excellently. It is so very simple of construction that every farmer can have one at but little expense.

Any one-horse cultivator that can be taken apart so that only the handle, beam and wheel remain may be readily converted into one of these root-lifters, or diggers. The only extra piece that is needed is a long, narrow shovel, that is either set into a mortise in the beam or tightly clamped to one side of it. This shovel must be long enough to allow the beam to run at the usual height from the ground and reach down below the roots.

KING HUMBERT TOMATO.
(Half natural size.)

The point of the shovel should have about the same form as that given to the narrow shovel-teeth of the garden cultivator, excepting the point, which should have a small steel wing attached on the right side. It may be a small steel plate bolted to the shovel proper, or a piece welded on. Commencing at a point at the lower end of the shovel, it should run outward and upward to a width and height of about five inches.

This lifter is drawn by one horse, which should be led or driven close to the left side of the row. The plow can be set to the required depth by changing the wheel and varying the pressure on the handles. If properly held, most of the roots will be thrown to the surface, while all will be so loosened and lifted that they may be readily and rapidly picked up after the digger. If the tops are very rank and heavy, they should be mowed off with the scythe before running the digger through, that the workman may see what he is about and hold the implement advantageously.

Roots should not be topped too soon after digging. The tops should be given a few hours to wilt, after which the juices will have become more solidified. If topped at once, before they have time to prepare for the change, there will be more or less bleeding from the cut portions, to the detriment of the roots.

After being topped, they should not be long exposed to the sun and wind. They

should be piled in heaps of ten or twelve bushels, and covered with coarse wild grass, or some such material that will exclude rain, but still allow the sweating process to go on unimpeded.

They need not be removed from these temporary pits until quite late in autumn, when heavy freezing begins to threaten. Their final housing can thus be done at a time of leisure, or after the rush of other work is over.

Roots are easily kept in pits through the entire winter. A long, narrow pit or trench may be dug, large enough to contain the amount to be stored, and this filled in sections of three or four feet in length, with walls of earth a foot or so in thickness between the sections. When so arranged, a section may be taken out at any time without disturbing the rest. The top covering should be of alternate layers of straw and earth, and should extend several feet over the sides of the trench, to prevent freezing from underneath.

W. D. BOYNTON.

THE KING HUMBERT TOMATO.

It cannot be said that European novelties always come up to representations; it is, therefore, gratifying to note that this new Tomato seems to have even more than fulfilled its promises. It was described as "of the size and shape of a large Plum, scarlet, very smooth and glossy, containing but few seeds, and in flavor closely resembling that of an Apple of fine quality; one of the earliest, and more productive than any other sort." One should hardly expect to find all these claims verified; but the following communication from Mr. C. S. Hnbbell, of Stratford, Ct., shows that the variety is deserving of all the praise claimed for it:

"When my Humberts began to ripen so unevenly, my hope fell; when, on slicing, I found the contents 'discontinuous,' there was no repressing my disappointment. As a mere curiosity, I plucked a truss carrying nine plum-shaped fruits and laid them on my library table. In a few days I was amazed to see how perfectly they had ripened, and how very brilliant they had become in their rich orange-red jackets. For more than three weeks we have now had them served, stewed, on the table; and though I have five other varieties in my garden, I am not able to persuade my family to use any other for this purpose. As a salad, we still find no other to equal the Aemo, or perhaps the Cardinal, which we are now also testing and have a very favorable opinion of.

"For prolificacy nothing approaches the Humbert; it yields more than double the weight of the others. From five vines I have already gathered over two bushels of fruit. The plants are literally one mass of touching berries.

"As soon as they begin to color on the vines, they ripen better in the house spread out on shelves, for their sugar and flavor are not fully developed until they become absolutely uniform in color, or a bright, vesuvian red.

"Their freedom from water makes it possible to serve them on the table with so little cooking that they do not lose their rich flavor, and eating from them is the finest I have ever tasted."

JERUSALEM ARTICHOKES.

It is to be regretted that two plants so widely differing as this and the real, or Globe, Artichoko should have received the same popular name, and thereby cause annoying confusion. "Topinambour," the French name, would be far more appropriate for this plant.

The edible part of the Jerusalem Artichoko is its tubers, which, in general appearance, resemble Potatoes, and are prepared in similar manner; but, being less mealy, they are more frequently used for stewing, salads, and pickling. The plant resembles a Sunflower, and grows to about the same height. Its culture is similar to that of the Potato; the tubers are planted in early spring, whole, or cut in four to eight pieces, according to their size, and regardless of the position of their eyes. The sets are then dropped every twelve or eighteen inches in furrows from three to four feet apart, and covered exactly like Potatoes. After the sprouts appear, the ground has to be kept clean from weeds, and cultivated; but it should never be stirred very deep nor hilled up much, as the roots and tubers penetrate the entire space between the rows, and would suffer seriously by deep cultivation.

In the fall, before the ground freezes, the tubers wanted during winter are dug and stored in a cellar or pit. Those for spring use may be left in the ground without injury, except in wet locations.

The principal varieties cultivated are the *Long Red* and the *White French*, the latter much the better for cooking purposes.

A TALK UPON PEAS.

Few products of the garden are more generally popular on the table than green Peas. The amateur is hungry for them before pods are large enough to gather, and the housekeeper counts the days until they will answer for use.

The sweetness and tenderness of this delicious vegetable depend more than some know upon the stage of growth at which it is gathered. The housekeeper who buys her Peas at the market often feels that she must have every pod distended by the fully developed Peas in order to make sure of the worth of her money, but every old gardener knows that Peas are sweeter and more tender when used before they begin to crowd each other in the pod.

A true gardener prides himself on getting the first mess of Peas from his garden before his neighbors' are fit. Although it may seem out of season to talk of early Peas now, those who desire to beat their neighbors next spring will do well to commence preparations this fall, before the ground freezes.

Late in the fall, choose, if possible, a part of the garden that is sheltered on the north by a high fence, a building, or a row of trees, and throw the soil into slight ridges with the shovel-plow or by hand. This will cause the soil to dry out in spring sufficiently to work several days before the remainder of

the garden will do to plow. Then, when the robins and blue-birds announce the return of spring, place a quantity of seed of one of the earliest varieties of Peas in a box of moist sand, placing the latter in a warm part of the kitchen. Leave them here until the Peas are well sprouted, sprinkling the sand with water as it becomes dry.

If, after the young shoots start, winter still rules out-of-doors, as it often does, set the box in a cool part of the cellar, cover it, to guard against mice, and rest in complacency, with the assurance that your neighbor can do no more than you have done. The box may remain in the cellar a month, if need be, without harm to the miniature plants.

Level the soil of the ridges as soon as it becomes dry enough to work, and plant the

Extra Early, and Ferry's Extra Early, on June 20. June 21 ushered in Bliss's American Wonder, Express, Prince Albert, Caracacus, Carter's First Crop, and Earliest of All. Next season, the list may read very differently.

It is to be remarked that the Prince Albert and Dan O'Rourke are comparatively old varieties. I may add also that another planting of Dan O'Rourke, the seed of which was imported from France, was not fit for use until June 25. Among the dwarf intermediates, I am much pleased with Pride of the Market, Stratagem, Market Garden, and Hair's Dwarf Green Marrow.

"ELM."

[The variations in the relative periods of ripening of Peas in different seasons, as stated above, form an interesting subject for experimentation; but it is not only in different seasons, but in different localities in the same season, that such changes take place. In our own garden, this summer, Express was the earliest, being fit for use June 21; this was followed by Cleveland's Impr. Earliest of All, June 23; the Rural New-Yorker, June 24; and American Wonder, June 25, all planted on the same day.—Ed.]

MANURING WITH RYE.

Gardening requires a great amount of manure, and to meet with success one must make use of every available source. One of them, which is strangely overlooked, is Rye. As the result of many years' experience, I consider it more profitable as a fertilizer for gardening purposes than anything else. Its growth is made late in autumn, after most vegetables have been removed, and early in spring before the principal crops are planted; it furnishes the soil with an abundance of plant food, while it saves the expense and hauling of bulky fertilizers.

Three years ago I sowed an acre of Rye, which furnished a splendid pasture all winter until the first of the following April. On the 18th, when three feet high, it was plowed under with the aid of a heavy chain hung from the

end of the whiffletree cross-bar to the plow-beam. A heavy drag was then run over the ground twice, furrowed and planted to Egyptian Sweet Corn. At first the soil was very hard to cultivate, but afterward it became loose and fine, and kept moist throughout the season. The Corn grew astonishingly vigorous, yielded the best crop I have ever raised, and the land still shows the effects of this manuring with Rye.

THOS. D. BAIRD.

ASPARAGUS FERTILIZER.

According to Dr. Goessmann's analysis, the ash of Asparagus contains fifty per cent. of potash, thus plainly showing that wood-ashes, or potash in some other form, constitutes a most essential fertilizer for this most delicious vegetable.

WHITE FRENCH ARTICHOKE.

LONG RED ARTICHOKE.

Peas carefully, with the radicle downward. Last spring (in a carefully conducted experiment) I gained eight days by sprouting my seed in this manner before planting.

Do you ask which is the earliest variety of Pea? Ah! that is a hard question. The earlier varieties seem to have entered into a combination not to give any one all of the credit. In 1882 and 1883, a distinct little blue Pea, sent out by Mr. Laxton, of England, under the significant name, "Earliest of All," led the van in my garden. Strange to say, the present season this ambitious candidate has to retire to the background to give place to eight successful rivals, of which the names are Cleveland's Rural New-Yorker, leading on June 18, followed by one planting of Dan O'Rourke, June 19, and Dexter, Kentish Invicta, Reedland, Shah of Persia, Thorburn's Extra Early Market, Landreth's

The Fruit Garden.

SEASONABLE HINTS.

Strawberries.—Our last month's hints on "Extending the Strawberry Season" elicited several inquiries about the best selection of varieties, and we cannot answer these more practically than by giving the dates of ripening of the principal varieties growing in our grounds:

June 6.—*Crystal City.*

" 7.—*Creseent, Black Defiance, Garden.*

" 8.—*Duchess, Downer.*

" 9.—*Wilson.*

" 10.—*Miner, Lemmig's White.*

" 11.—*Cumberland, Green Prolific, Hart's Minnesota, Juemda, Cinderella, Seth Boyden, Hervey Davis, Red Jacket, Beauty.*

" 13.—*Bidwell, Warren, Longfellow, Capt. Jack, James Vick, Manchester, Golden Defiance, Great American, President Lincoln, Seucea Queen, Prince of Berries, Daniel Boone, Kentucky, Glendale, Col. Cheney.*

" 15.—*Jersey Queen, Finch's Prolific, Mrs. Garfield, Atlantic, Mt. Vernon.*

" 18.—*Marrin.*

The last berries were picked on July 15th, principally of Marvin, and a few Mount Vernon and Atlantic.

Creseent or Duchess for early, Cumberland or Charles Downing for main crop, and Mount Vernon or Finch's Prolific for late, will, for so small a collection, give satisfaction to the majority of people.

Raspberries and Blackberries.—There is no better season in the year for planting these than this month. They start so early in spring, generally before the ground can be brought into proper condition, and time be found for planting, that frequently they receive a serious check by the operation; while now they are dormant, and more care can be bestowed upon them. In fact, most plants and shrubs and trees may be planted to advantage in autumn, provided the ground is dry and in proper condition. In heavy, cold, or wet ground, spring-planting is preferable.

Evaporating Fruits.—To within a recent date the only means for disposing of abundant fruit crops that could not be sold profitably were the cider-press and the pig-pen. The great improvements made of late in the artificial drying of fruits and vegetables, however, have opened some new channels, and the time is not far distant when an evaporator will be found in every fruit-growing neighborhood, if not on every farm.

Our export of evaporated Apples amounts already to over six million pounds annually.

The process of evaporating fruits is exceedingly simple, and with ordinary care in the management of any of the improved apparatus failure is almost impossible. A good evaporator is one of the best investments that can be made on a fruit farm.

Plant a Grape-vine this month. If you have no Grapes at all, and have room for one vine only, plant a *Concord*. This is still the surest; but if you have room for more than one, try some of the newer and far better kinds in addition. *Worden* (black), *Brighton* (red), *Duchess* (white) are all excellent varieties, and succeed in any locality at all favorable to Grape culture.

PREVENTING FROST.

How far can the fruit-grower and gardener prevent frost? It is one of his most destructive foes. Early fruits and vegetables are always the most profitable; but frost opposes these, and not infrequently destroys the entire crop of fruit-buds, or even the trees and vines. Here, in the West, the orchardist must contend continuously against frost; it destroys more Apple, Pear, and Peach trees than all other agencies combined. Small fruits do not suffer so much, but frost frequently destroys their fruit-buds. Each year it menaces the early gardener.

It was the old theory that dew was condensed from the air, the earth being cooler than the atmosphere. But now we know that the dew is formed from moisture brought to the surface of the earth by capillary attraction and there condensed into dew by the cooler atmosphere. If the earth were perfectly dry, there would be no dew; and as frost is frozen dew, there would be no frost. We cannot make the earth perfectly dry, but we can reduce its moisture, and just as we reduce the amount of moisture in the ground will we reduce the amount of frost. We know that the amount of frost is in proportion to the amount of moisture in the ground; we know that on damp ground there is frequently a heavy frost, while on higher, and consequently drier, ground there is none. Fruits and vegetables in the first locality will be injured, while those in the latter will not.

This presents another point: It is not the low temperature of the air and ground, but the deposit of the frozen moisture, which proves injurious. The high ground and the air above it are of as low a temperature as—very likely of a lower temperature than—the low ground and the atmosphere above it; but the fruit and vegetables growing on the former are not injured. This shows how much we can gain by reducing the amount of frost; and the fact that the damper ground is covered with a heavier frost demonstrates that the frost comes from the ground, and not from the air.

It is plain that to reduce the amount of frost we must reduce the amount of moisture in the ground. The moisture in the ground may be reduced sufficiently to prevent frost without depriving the plants and trees of a proper amount of drink. The plants and trees on the high ground, where there is no frost, thrive as well as those on the lower, damper ground. It is not that amount of moisture in the soil necessary to sustain vegetable life, but its excess, which produces frost.

How, then, can we reduce the amount of moisture in the ground so as to nearly, or quite, prevent early frost? I answer, by thoroughly under-draining the ground. Land under-drained for Corn and Wheat has greatly reduced frosts; but such lands are not thoroughly under-drained—the drains are yards apart. Make them closer together, and frost will be almost altogether prevented. In comparison with the Wheat and Corn producer, the orchardist and gardener occupies so little land that he can afford to make the drains this close together.

Under-draining would reduce the amount of frost, not only by taking away the excess of moisture, but by more evenly distributing through the soil the necessary amount. Un-

der-draining deepens the soil. Frosts are most often produced after a rain or snow has fallen, and the upper stratum of the ground is saturated. By removing the water from the surface, under-draining lessens the frost.

As under-draining in other ways fully compensates for its cost, the wide-awake gardener will hardly fail to avail himself of it. And we can take further measures to prevent frost, which at the same time give a full return by benefiting in other ways.

Of one of these only have I space to write. The more vegetable matter lying on the surface of the ground, the greater the frost. This is because the vegetable matter attracts moisture to itself, and also keeps the ground under it damp. This action is all the greater if the vegetable matter is decaying. My readers have noticed that there is often a heavy deposit of frost upon straw or vines, when there was none on bare ground nearby. Therefore, the neat, tidy gardener who keeps his grounds clean will suffer less from frost than the slovenly man whose grounds are covered with decaying vegetable matter.

JOHN M. STAHL.

HYBRID RASPBERRIES.

Having read some statements that the possibility of hybridizing our different species of Raspberries is still doubted, the results of some experiments which I made several years ago may throw some light on this question.

During the years 1865 to 1867 I sowed seeds of black Raspberries taken from a field in which they grew together with white and red ones. Among the seedlings came up nearly a score which, when transplanted, shot up much higher than the rest, had red or purple canes and imperfect berries. But three of them were smaller, very prolific, with undersized red berries of pleasant flavor.

In 1868, moving to my present home, I took the best of these specimens with me. Here I continued the raising of Raspberries from seed much more extensively. I purposely selected seeds of the Miami Blackcap from rows adjoining rows of Hornet, Herstine, and Brinckle's Orange. The seeds of all of which I sowed; and among my numerous seedlings were many undoubted hybrids. The cross between the Miami and Brinckle's Orange was a curiosity. The bush was like its black parent, but much smaller and weaker. The berries were white, with the ends spotted over with black. I raised many seedlings from the red berries that those hybrids bore; they all seemed to have the same characteristics as their parents, and fully satisfied me as to their being true hybrids.

H. J. SEYMOUR.

OVERLOADED TREES.

A tree overloaded with fruit, P. Barry says, can neither perfect the fruit nor ripen its wood properly, and in a severe climate is quite likely to succumb to a degree of cold which, under proper treatment, it could have resisted. The Grape is very sensitive in this respect. It is safe to say that millions of trees are annually ruined in this country by over-crops.

THE AMBER QUEEN GRAPE.

This new Grape, now introduced by Messrs. Ellwanger and Barry of Rochester, N. Y., is described by the originator as follows:

"Bunch large, shouldered like the Hamburg; berry large, frequently oblong; holds persistently to the bunch; amber-colored at first, but grows darker, till it becomes a purple Grape; flesh tender, rich, and seeds small; plant a strong grower with thick leaves, somewhat downy on the under side. Fruit always eatable in August, and with proper care will keep all winter."

The barrels are placed upon stagings slightly raised, to keep the bottoms from the wet. The cellar is kept dark, and as near the freezing point as possible without freezing the fruit. I have had excellent success in keeping the fruit till very late in the season and with but little loss from decay. Those who adopt this method of storage think that the moist atmosphere retards the time of ripening.

In some respects, the present season has been a remarkable one; the latter part of July and the first part of August have been unusually wet—quite a contrast to the summers of many years past. Next winter's experience in storing Apples may, therefore, show different results, as the meteorological

THE BORDEAUX DISTRICT OF AMERICA.

Grapes of the most luscious kind grow in wild profusion in the Albemarle section, and the most valuable native species are indigenous to North Carolina. In an address before the Press Association of North Carolina, Mr. P. M. Wilson expresses the opinion that the Piedmont slope will be the Bordeaux district of America.

"A glance at any physical map of Virginia, North Carolina, South Carolina, and Georgia," he says, "will prove the wonderful advantages of situation that these States possess for Grape culture. A study of the geological formation of the slope along its entire trend, and of the chemistry of its soil,

will satisfy the inquirer that every variety of soil, and of almost every grade of fertility, is furnished by this sweep of country, which is more than a thousand miles in length, and varies in breadth from fifty to one hundred miles. Meteorological observations, extending over a series of years, have demonstrated the mean climate to be all that could be desired for the growth of vines, and the fruiting and ripening of the various varieties of Grapes that are grown in this belt.

"Humboldt gives the thermal limits of profitable viticulture as follows: The mean annual temperature should exceed 49°, the winter temperature 64°, and the mean summer temperature 64°. These limits are at Bordeaux respectively 57°, 43°, 71°. In the middle section of the Piedmont region in North Carolina, where observations have been made in many localities by the State Geological Survey, the corresponding figures are 58°, 44°, 74°; and a very judicious French writer on this subject, Chaveronvier, has observed that the exceptionally good vintages

PICKING AND WINTER CARE OF APPLES.

Apples that are very fine when on the tree are often rendered almost worthless by being picked at improper times and by carelessness in their storage during fall or winter.

In some sections of New Jersey, those to whom tradition is the only guide say Apples keep best if picked from the tree at or soon after the full of the moon in the month of September. Such people are like the blind leading the blind, apt to fall in a ditch. Nature cannot be controlled by set rules as to dates for the picking of fruits. Apples should be picked as soon as the stem separates easily from the branch, the date of which will vary considerably in different years. The keeping qualities depend in a great measure on removing the fruit from the tree before the ripening process is far advanced.

Handle with care, remembering that every blemish shortens the time of keeping. Place in good, clean packages suitable for storage. All of the so-called Russet varieties should

be securely covered to exclude the air, and not be opened until needed for use, as the keeping of these depends upon having them completely protected against currents of air.

The place of storage is of equal importance. Opinions are divided as to whether fruit keeps best and longest when stored in dry or moist air. As dry storage is the method generally employed and best understood, that of moist will be considered. For several years I have stored Apples in barrels from which the air is excluded by a cover of boards somewhat larger than the opening at the head end just laid over the top. The cellar is that of an out-building with a dirt floor, upon which at times during the winter enough water will collect to become muddy.

conditions of a season have a great influence on the keeping qualities of fruit.

The various natural defects inherent to certain varieties become also decidedly apparent by any process tending to retard the ripening of fruit. Climate, seasons, soils, and locations exert also powerful influences in this regard, and it is only by careful observation and experience that the peculiarities of each variety under given conditions can be ascertained. So, with me, the Baldwin Apple is subject to molding at the core, even when kept perfectly dry, and the more ripening is retarded, the greater this evil becomes; hence the variety cannot be kept very long by any process.

J. B. ROGERS.

correspond to the years in which a high temperature characterized the vintage months, while the thermometer ranged low in those years which were marked by inferior vintage; and it is well known that in our South Atlantic region the summer temperature usually reaches beyond the middle of September, so that the average for that month is 70°.

"The number of vineyards in North Carolina is already encouragingly large. The famous Tokay Vineyard, near Fayetteville, is the most extensive one in the State (and, indeed, the largest single vineyard in the South, if not this side of the Rocky Mountains), and whose fine native wines bore off the premium at the Atlanta Exposition."

THE AMBER QUEEN GRAPE.

The Flower Garden.

BELATED.

A single Buttercup I found,
A star upon my weary way,
As summer closed her heated round,
And ushered in the autumn day.

A little memory of May
That slept too late, as I have done,
And so unknowing gone astray,
And now stood lonely in the sun.

It seemed with anxious look to ask,
Are all my bright companions dead?
Or have I slept, forgetting task,
Until the lovely May has sped?

There waves around me autumn grain;
I see the ripened Apples shine;
I feel the pitter of the rain;
I see the Grapes that blush with wine.

Ay, yes, I slept, I sweetly dreamed
Of babbling brook and azure sky,
And in my foolish fancy deemed
That flowers, like me, would never die.

From such a dream why should I wake,
Afar and in another zone—
Wake, only that the heart may break
To find myself alone, alone?

And this it is to live too long,
To overpass our proper time,
And hear, instead of merry song,
The bells of death in solemn chime.

So, too, with man: youth slept away,
He wakes to find a useless age,
And wearily from day to day
Drags out an aimless pilgrimage.

—Harper's Weekly.

SEASONABLE HINTS.

The first frost, which, in this vicinity, occurs generally in the second week in October, brings with it considerable work in the flower garden. All tender bulbs have to be lifted without delay, and prepared for winter storage.

Hyacinths, Tulips, Narcissus, and other *Dutch Bulbs*, although they may be planted at any time before the ground freezes, will do better if planted now, while the soil is still dry and mellow, and we trust that no reader of the AMERICAN GARDEN will let the month pass without planting a bulb bed, however small. To the lover of flowers nothing can equal the delight of watching and caring for his spring flowers, which will surely reward all the attention bestowed upon them with their fragrance and bright spring greeting.

There is not the least difficulty about their cultivation. They will grow in any good, rich garden soil mixed with some sand, and the only condition absolutely imperative to their success is that there is never, at any season, water standing about their roots. Artificial drainage is, therefore, necessary when the ground is not naturally free from standing water. In small beds, where an outlet is not easily obtainable, this may generally be accomplished by removing the soil to a depth of about three feet, filling half of the space with stones, covering these with a layer of sods and filling up with soil, adding plenty of well-decomposed manure, and raising the bed a few inches above the level. Large bulbs should be planted from four to six inches deep, smaller ones three inches.

GARDEN VIOLETS.

In our country, Sweet Violets, which should be the common treasure, are aristocratic flowers, seldom found outside of old family gardens, where they have bloomed for generations under the same hands, or in fashionable houses in winter, perfuming the air at half a dollar a bunch. Why they should be so reserved a flower it is hard to say. The Violet is a hardy plant, even in the ungracious climate of Boston, in whose suburbs are lovely old gardens, where the Box hedges and the Lily of the Valley beds and Violet borders have kept company for twenty years to my knowledge. How sweet it used to be to stroll in May afternoons past the old Watertown and Cambridge houses, where the Hawthorne showed its pink, and the Elms were in their veils of young green, and the air was soft with the odor of English Violets. I have always meant to deserve well of my country by having a large Violet bed, and stocking my garden so full of Lavender, Mignonette, and Snow-drops, Balm and other sweet things that they never could run out. If you wish to be well remembered, plant Violets.

The Violet is a blossom for all the year round, and there is not a month when one need be without fresh blooms of it from cold-frame, garden, or window-boxes. Planted in a shady corner of the garden, where yet they have an airy, well-drained nook, Violets will take care of themselves, with the kindness of a covering of dead leaves in fall. But they last so long and give such richness that the borders are worth preparing well. What the garden Violet dislikes most of all is standing with its feet in the wet, unlike the fragrant white wild Violet, which we find in meadows and bogs.

My Violet border is planned to give a succession of bloom the year round, the earth from the three-foot bed being dug out two feet deep, and the sides stoned up with rubble laid in mortar with which coal-ashes have much to do. This keeps the Violet roots from gadding, and from freezing, likewise. Nine inches of stone are filled in for drainage, with turf and some old pounded mortar above, to keep the earth from washing down, and the other foot is Violet soil—good strong loam for the basis, with liberal mixture of old barn-yard stuff, and the top leaf-mold, rich garden and sand with plenty of bone-dust, which Violets love. The border lies under the lee of a little wood which skirts the grounds, facing full south, but screened by tall plants the other side of the walk. Here the roots will spread into great crowns nearly two feet across, within the year, and every leaf will bear its blossom, one may say. In this favored spot one may feel sure of finding Violets in any month of the year.

In autumn, a wooden frame and sash goes right over the border; plants that have been growing in the shady corners of the garden are brought under cover, the old ones well enriched and half smothered in dead leaves, which are heaped around the frames, and the Violet season goes merrily into Christmas-tide. New plants are coming into bloom while the old ones are resting. They got their bone-dust, their weak tea of old leaves, old wood, and very old manure steeped in rain-water when the soil is very dry, and they do nothing but grow and blossom. Only one thing they ask—not to get

too wet. You can hardly give Violets little enough water in cold weather. Only till the earth is dry several inches deep, need you water them, which will be once in two or three weeks. They will bear the sashes lifted in sunny noons, and warm winter rains for perhaps half an hour; but avoid letting them get drenched, or having any drip from the sashes. That brings yellow leaf and decay among the crowns.

Very few people know the varieties, even, of sweet Violets which enrich the border. The English, the Neapolitan, and some recall the new Russian varieties, are barely known by name; but you will hardly find one well-educated person, not a gardener by calling, who can tell the difference. As the sweet Violet, *Viola odorata*, is native in England, Russia, Italy, and throughout Europe and part of Asia, we may look for differences of interest in all.

Neapolitan Violets are pale, long-stemmed, and so fragrant that you think of Violet Attar in the room with a cluster of them.

Marie Louise is deeper purple, and a rich bloomer, which with care, in the open garden, starting early in a sunny, sheltered place, will give flowers in spring and autumn.

The English Violet is deeper purple still, and the standard garden variety for ease of cultivation and sweetness. Roots of this should be planted in every sheltered spot, under shrubbery, on light wooded banks, the north side of houses and arbors, wherever one wants the winds to be laden with sweetness.

The true *Russian Violet* is small; the *Czar*, large, deep purple, almost black by the side of others, and very sweet.

The Victoria Regina, a large, deep-hued, scented Violet, is not to be confounded by hearsay with the *Queen of Violets*, which is white, double, and large, vying with the *Belle de Chatenay*, inimitable for its tinged pale petals, which suit the snow-wreath *Heliotrope*.

The winter cultivation of Violets is easy, and they are the most charming of house plants, bearing dry air and neglect with more equanimity than many favorites, only dying of gas and overheating.

EAST DEDHAM.

THE COLEUS.

All things considered, I think the Coleus is our best bedding plant with ornamental leaves. Of course we have other "foliage" plants with finer leaves and more attractive coloring, but none with which I am acquainted so sturdy and self-reliant, so tractable and so little given to disappointing the grower.

The best new varieties that I have grown this year are *Retta Kirkpatrick* and *Felbet Mantle*. *Retta Kirkpatrick* is a very robust variety, with large leaves, considerably waved on the edges. The center of the leaf, and the largest part of it, as a general thing, is a creamy white; the balance of the leaf is a bright green, and the contrast between the two colors is very pleasing. The plant is not only an acquisition of great merit when used as a single specimen, but is even more valuable for bedding uses, as it forms a striking contrast to all other varieties of Coleus in which dark colors predominate.

Velvet Mantle is so much like the old *Verschaffelti* that I almost thought that variety had "turned up" again when my plant was small. But as it grew, I discovered that it was a finer variety. The leaves are very dark, of a purplish, velvety color, veined with dark crimson when given a good light, and when grown with *Retta Kirkpatrick* the effect is very rich and fine. To bring out the color well in the house, it must be placed near the glass and get plenty of sunshine. If not grown near the glass, the color will be neither maroon nor green, and not at all satisfactory.

Mrs. Garfield is a very fine variety, having a leaf with a large maroon blotch in the center, veined with pink and edged with green, with occasional markings of yellow. *Harlequin* is another very showy variety, being striped, blotched, and spotted with all the colors known to the *Colens* tribe. It fades, along toward the end of summer, into pale tints that have a peculiar "autumn-leaf" effect, and it is then that I like this variety best.

I have always grown the *Colens* in pots, in a mixture of ordinary garden loam, made quite rich with well-rotted barn-yard soil, and made light with sand. In such a compost the plants grow rapidly, but not too much, so as to be weak or spindling. Keep the leading branches pinched in, and you will never fail of having bushy, well-shaped plants.

To have good plants of the *Colens* in winter, I take cuttings before frost. They root so readily that I stick them down anywhere until large enough to

put in small pots. These soon make good-sized plants, and they help to brighten the window during a dearth of flowers. In March I cut the old plants up, and root as many new ones as I expect to use in the garden during the summer.

E. E. REXFORD.

PYRETHRUMS.

If any one of our commonly grown hardy perennials may be said to have become improved of late, says *Gardening Illustrated*, from which the accompanying illustration is reproduced, it is the *Pyrethrum*, both single and double.

The varieties of each are numerous, and

an inferior flower is now the exception. From pure white there are many ascending shades up to deep magenta, approaching crimson. Not less varied and bright in color are the single flowers, and the tints are generally soft and pleasing. There is nothing of the rigid formality of the *Dahlia* in the build of the *Pyrethrum*. It is true that the flowers are full and symmetrical, but there is an outer fringe of guard petals that saves them from being too formal. If any one will examine a flower of a double *Pyrethrum* they will observe that the outer edge is made of a zone or ring of florets, while the center is filled up with a very large number of short, quilled florets, and the

the soil; and the better it can do this, the more vigorous is the growth and finer the flowers. It is by no means difficult to cultivate, and is perfectly hardy if reasonably dry at the roots. It is wet which kills the plants far more than hard frost.

If the plants can be grown permanently in a bed, they can be better cultivated; they are greatly helped by some mulching in early summer, by keeping the surface soil stirred in hot, dry weather, by watering freely when necessary, and by giving a good surface dressing of manure and leaves in autumn, which can be forked into the soil in early spring just as the plants begin to make growth. *Pyrethrums* are very effective in the mixed border, and some clumps should be dotted about in association with kindred plants, but they cannot be cultivated so successfully as in a prepared and well-tended bed.

WINTERING ROSES.

To winter Hybrid Perpetual Roses in a climate where the thermometer occasionally indicates thirty degrees below zero is an important question. The principal aim of the grower should be to so ripen and harden the plants that, by the first of November, they are in a comparative state of rest. In this condition, and, if possible, just before hard, stinging frosts, take up the plants, cut out all soft, watery growth, sort carefully, tie up in neat, snug bunches of twenty-five or less, and they are ready for winter quarters.

Select dry, well-drained ground, dig two trenches, each a foot or more in width and about two feet deep, parallel to each other, leav-

ing a wall of earth a foot wide between; pile all the soil that will stay on this middle division, the rest outside; then put in the bunches closely together, the tops meeting over the middle ridge. At the proper place put long stakes with name and number; throw in enough soil to thoroughly cover the roots, firm it down, take clean, long straw, covering completely all the exposed portions, fill in the trenches with remaining soil, on and against the straw.

Just before winter sets in, we finish by banking up with soil on both sides, entirely covering the plants, reminding one somewhat of *Celery* when banked up for the last time. — *S. T. Phoenix, before the American Nurserymen's Association.*

PYRETHRUMS.
(Natural size.)

thicker these are developed, the more double is the bloom.

The single forms have one or two circular rows of large flat florets, much larger and broader than in the case of the double types, with a showy and striking golden disk. Both types are very pretty, and both have their special admirers.

To propagate *Pyrethrums*, they are divided in autumn and potted. By spring they have become well rooted and are then in good condition to plant out in the open ground. In order to grow a collection, it is best to plant them in a prepared bed of free, rich loam, made light and friable by digging, and further enriched by the addition of manure. The *Pyrethrum* strikes its roots freely into

The Window Garden AND GREENHOUSE.

WINDOW GARDENING FOR OCTOBER.

We should now be more fully prepared for winter by having all our tender plants ready to take indoors as soon as frosty weather or other occasion requires. Providing we can protect our Carnations, Geraniums, Fuchsias, Chinese Primroses, Cactuses, and other net too tropical plants on the piazza for a while, it is better not to introduce them to our windows. Although they may require a little protection at night, the warmth and genial weather of the day-time is far more beneficial to them than the indoor atmosphere of our dwellings. But in the event of severe weather, do not take risks by leaving your plants on the piazza, but take them indoors. Many house-plants, as Century Plants, Myrtles, Carnations, and Mignonne, may not appear to be injured by a few degrees of frost, but please remember, frost does not benefit any of them. And frost is far more injurious to plants after being petted than while growing out in the garden.

Besides, unless you are well acquainted with the nature and needs of your several plants, you may, in mistake, submit some of the tender ones, as Heliotrope, Celens, or Poinsettia, to the cool treatment that an Orange, Sweet Bay, Verbena, or Meteor Marigold might bear with impunity, and find that the tender plants have been hurt. Therefore, be on the safe side, and keep all of your pot-plants from frost.

CLEANLINESS.

Before housing your plants, see that they are entirely free from parasitic insects. Buhach and other sorts of Pyrethrum powder may dislodge aphides and thrips, but if your plants be infested with red spiders, you had better wash every stem, branch, and leaf with a sponge and soapy water, using water unstintingly; if with scale, rub or scrape them off, but not so as to scratch the plant, then wash clean; and if with mealy bugs, brush them off. Fumigating with Tobacco smoke is very well in a greenhouse, but almost impracticable in a dwelling-house, notwithstanding stereotyped advice to the contrary. Besides, Tobacco smoke only destroys aphides and thrips, and has no visible injurious influence on red spiders, mealy bugs, or scales.

WASHING FLOWER-POTS.

No matter how fresh, and gay, and pretty your plants may be, if your flower-pots are covered with green, slimy conserve, they will give an ill-look to your treasures, and cry aloud your own slovenliness. "It is too hard work to wash the pots" is worse than no excuse. I know precisely how hard, or rather how easy it is, and should not excuse any one who is not an invalid.

STAKING PLANTS.

If plants need support, stake them; but let your stakes be neat, not taller than the plants, and do not use more of them than are needed. So arrange the stakes and tyers that they shall not be conspicuous; but, if

possible, hidden among the branches and leaves.

WATERING.

Callas, Cinerarias, Chinese Primroses, Carnations, and other plants that are in full growth require plenty of water, but so much as to render the soil sodden should never be given. Fancy and show Pelargoniums (Lady Washington Geraniums) starting into growth should not be watered much at the root, but slight sprinklings overhead encourage fresh growths to come from all the joints about the stem. Zonal Geraniums that have been lifted from the open ground need very little water, and they should be kept perfectly dry overhead till they get a fresh start. Cactuses and Century Plants need no water, providing they are kept in cool quarters. Evergreen plants, as English Ivy, Camellias, Azaleas, Oleander, and Oranges, if kept in a moderately cool place, need very little water; still be careful never to allow them to get dry, else you will hurt them seriously, even although they may not show it at the time. Ferns should be kept moderately moist all the time.

WINDOWS FOR PLANTS.

The north-facing, or sunless windows, will do very well for Chinese Primroses, Cinerarias, Calceolarias, Camellias, Azaleas, Ivies of all sorts, Begonias, Ferns, and Mosses; also, pots filled with rooted slips of Geraniums, Ageratum, Heliotropes, and the like for next summer's garden. East or west windows may be allotted to most kinds of plants, over which, if they wilt while the sun shines on them, a muslin curtain may be drawn in front of them. South-facing windows should be allotted to Roses, Geraniums, Callas, Petunias, Oxalis, Pansies, Heliotropes, Paris Daisies, and other winter-blooming plants that require sunshine to bring them into full blossom.

VENTILATION.

Do not coddle up your plants, with the idea you are doing them good. Let them have plenty of fresh air, by lowering rather than raising the window if possible; or, better still, if raised a little and lowered a little, too. But, at the same time, keep the door shut, as plants are sensitive to drafts and injured by them. In the event of a gentle, warm rain, set your plants, or some of them, out-of-doors, to get the benefit of it.

CHRYSANTHEMUMS.

What splendid flowers they are, so large, so bright, so gay, and borne in such extreme profusion! And how accommodating! As outdoor garden or indoor pot-plants they are amenable, and will repay the room and care they need. We may lift them from the open garden plots even when they are in flower, and pot them or transplant elsewhere in the garden with success. I grow them in summer in plots in the vegetable garden and orchard, and as my summer flower-beds have been emptied of their Geraniums, Celenses, and other tender plants, I fill them up with Chrysanthemums. I also pot many of them. Those in pots I can stand closely together under an awning, keep them on the piazza, or any place that is warm and sheltered, take a few into the house or greenhouse, and thus secure all their blossoms. In lifting, secure all the fine roots (and this you can do

better in dry than damp weather), pot or transplant immediately, and water copiously.
WM. FALCOONER.

A GREENHOUSE FOR EVERYBODY.

Small, inexpensive greenhouses are increasingly in demand, and directions for their construction inquired about. If to be attached to the dwelling, the location, arrangement of the house and its rooms, and many other conditions, will naturally necessitate changes and modifications of almost any plan that could be given. But, after all, nothing can convey a clearer idea of their management than the description of actually existing, satisfactorily working structures of this kind. It is, therefore, with pleasure that we have received the following from Mr. N. T. Lackner, Astoria, N. Y.:

"My greenhouse, 12x3½, and 10 feet high, constructed by myself last fall, leans against two east windows of my house, through which the plants receive the necessary heat. The top sashes can be raised, and another window communicates with an airy cellar, so that complete ventilation can be given. Water drains readily through the ground, so that the syringe may be used freely whenever necessary. There is some space between the greenhouse and a fence in front, which I had filled out with hay up to the glass and covered with boards. This secured a temperature of from 40° to 50° all winter, which was sufficient to produce an abundance of flowers all the time, mostly from plants raised from seed. A Wistaria, which is inclosed, was in splendid bloom in December and again in February, deliciously perfuming the whole house. A Honey-suckle, which is also inclosed, had but few blossoms, and as it shades too much, will be taken out.

"When I built the greenhouse, I expected that it would make the room too warm in summer, and therefore arranged it so that it could be taken down. But at the approach of summer the whole structure, filled with bright colors and fragrance, gave the room so enchanting an appearance, that I could not bring myself to sacrifice it, and to my great satisfaction I found that it not only was not objectionable, but kept the room most comfortably cool."

POT-BOUND PLANTS.

After plants have been growing for a long time in pots or boxes quite too small for the capacity of the roots, the rootlets and fibers will form a thick mat all around the inside of the pot. Of course, as the roots cannot spread out, the plant will usually cease to appear as thrifty and luxuriant as the florist may desire. The remedy is to dump the contents of the pot and place them in a larger vessel. Prior to replanting, run a sharp knife up and down the mat of roots in half-a-dozen places about the ball of earth, so that new roots will strike out readily after the plant has been placed in a larger pot. It is a grave error to attempt to keep certain kinds of flowering plants in pots that are not one-fourth as large as they should be. Geraniums and Roses especially need pots of good size. Small pots tend to dwarf the growth of most plants, and unless, when used, liquid manure is applied frequently, but little satisfaction can be obtained.

S. E. T.

BULBS FOR WINTER FLOWERING.

Among all the many flowers for adornment of our apartments in winter, bulbs must always take front rank, not only on account of the ease with which they are cultivated, but also for their brilliant hues and exquisite fragrance. What can excel the perfume of Hyacinths, Lilies of the Valley, and Easter Lilies? And every one can raise them in profusion if they will plant them in due season and cultivate them properly.

HYACINTHS.

Hyacinths are the most desirable bulbs for winter blooming, and every one knows the richness of their fragrance and the beauty of their coloring. But some persons think them too sweet for parlor flowers; yet if they are put into the hall or an open way at night, their odors will not be too overpowering to the most delicate constitution. In fact, growing, healthy plants of all kinds are the most desirable adjunct for city and country houses as a sanitary measure.

The bulbs may be grown either in pots filled with sandy soil, or cocoa-nut fiber, or damp sphagnum, or in glasses of water, with a small bit of charcoal at the bottom to keep it sweet. The bottom of the bulb should just touch the water, which will soon evaporate, so as to be a little below the base of the bulb. A layer of cotton batting can be laid around the edges of the bulb within the glass, and kept moistened, so as to prevent the evaporation of the water.

If you desire to have your Hyacinths in bloom for Christmas, put them into pots or glasses as early as possible in October, and you will have a fine display. If required at Easter, plant them early in December or January. A large bulb will flower well in a small pot; but it is a better plan to plant three or six in large pots and produce more flowers.

After the bulbs are planted, put them away in a dark cellar for three or four weeks, or until their roots have struck far down into the glasses or pots, and their leaves are beginning to show themselves. Then place them in a sunny window, and keep the soil well moistened in the pots. A furnace-heated room of 73° or 78° is too hot for a good development of stalk and buds, so place them in an upper chamber where the frost will not touch them, and where the mercury rarely rises above 65°. Thus treated, they will grow finely and fully repay you for the little labor you have given them. If the stalk does not incline to shoot up well, twist a cone of white paper and place the wide part over the bulb, then cut off the top a little, and the buds will shoot upward to the light. Always

water bulbs in pots with water quite warm to the hand, and once a week drop into it five or ten drops—according to quantity of water—of ammonia water.

Single Hyacinths will flower more satisfactorily in the house than the double varieties. Roman Hyacinths make a pleasing addition to a collection of bulbs. Their bulbs are smaller and cheaper than the ordinary Hyacinth, but the flowers and odor are almost as beautiful and delicious.

THE LILY OF THE VALLEY.

This most exquisite flower can be forced for the window-garden as easily as Hyacinths,

ground plant them out, and possibly they may flower again. The florists keep pots of Lilies of the Valley started, for sale, and in purchasing a supply of winter-blooming flowers they should not be passed by. The roots can be dug up after the ground has frozen in December and be brought forward to blossom by Easter.

THE BERMUDA EASTER LILY.

This Lily has not been long known to flower lovers, but it merits their recognition as a very beautiful Lily especially adapted to forcing for winter flowers, and for Easter decorations it is unequalled. Its flowers are of waxen whiteness, and trumpet-shaped, like *L. longiflorum*, of which it is a variety. It will continue in blossom from ten days to a fortnight, and a large bulb will give from eight to ten flowers, and in some cases as many as thirty flowers.

In Bermuda it bears a much greater number of buds and flowers, and they are much sought for in that flowery island. It will also bloom two or three times in succession, thus making it doubly valuable both to the florist and the amateur gardener.

A large bulb should be planted in a six or seven inch pot, filled with sandy, peaty soil, and set aside a little while to develop its roots, yet not in a damp, dark place. The culture of these Lilies should be the same as is given to the English White Lily, and *L. longiflorum*. Keep the soil duly moistened, but not too wet; and a sunny upper window would develop its growth, in the house, better than a heated atmosphere. After its flowers are well developed, it can be brought down-stairs for an ornament to library, hall, or parlor; but always place it in a cooler place at night, where it will not be chilled.

AMARYLLIS.

The Amaryllis will force finely for Easter flowers, and the new hybrids which have been raised by *M. Louis Van Houtte* and *M. Fouchet* are very beautiful for this purpose. Some of the flowers of these bulbs have a white ground, lined and striped with red and rose color, while others have red petals striped with white. *Amaryllis Johnsonii* is also a most beautiful bulb for the window-garden, and if planted in October, it can be made to bloom in glorious beauty by March. Its flowers are very large and of a most vivid red with a band of white through each petal. Several flowers are borne upon one stalk, and they are the admiration of all beholders, and cannot be too highly recommended to all lovers of winter-blooming bulbs. Tulips, Narcissus, Crocuses, are all desirable for house culture.

DAISY EYEBRIGHT.

ROMAN HYACINTH.
(One-third natural size.)

Tulips, or Crocuses, while its waxen bells and rare perfume far exceed that of any other flower. After their leaves have become well dried off, dig up a large clump from the garden—if you are the fortunate possessor of a Lily bed—and plant them in sandy soil or moss or Cocoa-nut fiber, then dampen it well and place the pots or boxes in a cool place where the sun will not touch them, until you see the hooded leaves springing upward; now place in a sunny window in a well-aired room, not stiflingly hot, and in six weeks you will have lovely clusters of most perfect flowers. After flowering, take the roots from the pots and put them in the cellar, and as soon as the frost has left the

Lawn and Landscape.

GROUPING OF SHRUBBERY.

Shrubs may be used to ornament a lawn in two ways, singly or in groups. Their charm consists in their rounded outline, their low, broad growth, and their bloom. If left to their natural development without other pruning than that of shortening in redundant growth, they all suggest the idea of concealment. This is preëminently the case with wild suckering shrubs, like Elders, Aldors, Hazel bushes, etc., which hide the borders of forests and conceal swamps, stumps, logs, stone-piles, and Virginia fences from view with pleasing masses of verdure and gay flowers. Their more civilized congeners, Weigelias, Syringas, Lilacs, and many others, have the same habits, of which we cannot deprive them without making unnatural, hideous specters of them. They even maintain this character when grown singly.

The specimen Tartarian Honeysuckle, that graces and beautifies your lawn with its swelling outline, its wealth of tiny bloom and translucent fruit, may in its broadest development hide from your favorite window or porch a neighbor's barn-yard, with its array of wagons and sheds, its half-consumed straw-stack and manure-heaps. On the other hand, if improperly placed, a shrub or group may shut out a beautiful picture, as I once saw a group of Quince bushes hide from a sitting-room window an exquisite view of a miniature lake and a mountain-side beyond. The rounded contour of shrubbery eminently fits it for the curves of drives; and some of the most delightful effects in large parks and cemeteries come from the proper using of masses of shrubs.

Taller-growing shrubs might often be used to advantage in farmers' door-yards. In many cases the carriage-drive goes straight from the street to the barn-yard, revealing much that is not especially attractive. A graceful curve leading toward the house, while the direct line of vision became broken by a group of such shrubs as now encumber the front yard in unmeaning clutter, would be a gratifying change that many a farmer could afford to make just for the greater ease with which the surroundings of the house could be kept in order.

In grouping shrubs, those of upright growth and the habit of bearing their flowers on the topmost boughs are ominently fitted for the center, while the outer plantings should be of weeping or pendant forms. The taller Lilacs, the *Syringa grandiflora* and the Altheas, belong to the former, while the Weigelias, some of the *Spiræas*, and many others belong to the latter class. As a general rule large masses of shrubbery should, as far as practicable, be of the same genus, diversity being obtained by planting different species and varieties. In this way a group of Lilacs, for instance, can be made more effective than when only one variety is used, and with different species the defects of one may often be covered by the peculiarities of another. The double Altheas, for instance, are deficient in foliage and branches in their lower parts, which makes them unfitted for grouping alone; but set one in the angle of a fence or building, with a Golden *Spiræa* or Rose Weigelia in front, and you secure all

that is beautiful in both, while occupying the room of but one.

Sometimes shrubs of marked beauty can be planted with an overgreen background, to the advantage of both; a *Syringa* or Rod Dog-wood in front of a Norway Spruce, or a *Spiræa prunifolia*, or *Deutzia gracilis* near an overgreen hedge, form beautiful contrasts.

Even shrubs of dissimilar habits look better in groups, when by that means the lawn is left with large areas of clean grass. Three shrubs that once nearly filled one side of a village door-yard were dug up, and small rooted slips of the same planted six feet apart in a triangular group near the gate. Now, after twelve years, they have grown into a pleasing group whose beauty is greatly enhanced by the unbroken grass-plot between them and the house. The shrubs were *Spiræa prunifolia*, *Pyrus Japonica*, and the Sweet-scented *Syringa*.

The nooks in shrubbery groups may often be used to advantage for planting herbaceous or annual flowers, as Cannas, Hollyhocks, or Peonies.

L. B. PIERCE.

CONSTRUCTING ROADS.

Walks and paths are located and constructed either for utility or ornament. When for use entirely, they should be as direct as possible, without unnecessary windings or detours. When an adjunct to ornamental grounds, some people fall into the error that because it was once said "the line of beauty is a curve," all things crooked must be pleasing, and they lay out their avenues on this principle, the seeming excuse for a curve being that there is a corresponding or a worse curve somewhere else. At all points where avenues deviate from a direct line, there should be a close plantation or clump of trees, so that it may appear as the most natural thing for the detour to be made.

Water is the bane of an avenue; as ordinarily constructed, it saturates the earth, swells the subsoil, if clayey, when frozen, and leaves it a mortar-bed in a thaw. The two principal things for a properly constructed avenue are to resist the wear of travel above and the flow of water beneath.

The customary plan has been, after the location was decided on, to dig up the turf and loam, filling the shallow trench thus formed with any clean material that might be convenient, and to rake and roll the surface, which in spring becomes little better than a puddle. The result frequently is the substitution of a plank or concrete walk. Half the expense of either would have constructed a walk of equal width that would be smooth, hard, and dry at all seasons.

If a simple path is required, three feet in width is sufficient; but if it is wanted to be wide enough for two persons to walk abreast, not less than five feet will suffice. Cut a clean trench of this width from twelve to fifteen inches in depth according to the nature of the soil; then lay an inch drain pipe in the middle, care being taken to avoid sags in the grade, either of the walk or the drain, but when unavoidable be sure to have a sufficient outlet at the lowest point. Obtain good coarse gravel and screen it twice, next, and reserve the finest for the top layer. On the second layer put a thin covering of gneiss drift, composed of mixed clay and

sharp, angular, unwashed gravel, and packs firmly together, so as to be impervious to water. On this put the final coating of fine gravel and roll carefully and well.

Such a walk is not only cheaper than wood or composition, but will not decay like the former, or smell of the gas-house like the latter. The color of gray gravel and the absence of heat are much more agreeable to the eye and the foot than if the composition were used.

For an avenue the construction is substantially the same, but the excavation should not be less than eighteen inches deep, and should be lowest in the middle, where should be a drain pipe, increasing in diameter as we proceed from the highest part. The bottom half of the excavation makes an excellent place to deposit all the old walls and rough stone to be found everywhere in Massachusetts. This should be dumped carefully, and so disposed as to present a tolerably fair surface. On it lay screened gravel exactly as directed for walks, but use a heavier roller, and the avenue is completed. In selecting gravel, avoid all that has a washed or pebbly appearance, as it will never become compact.

Gutters not only give a nice finish, but prevent the continual wash of the margins. Catch-basins should be introduced at intervals, particularly at any change of grade, and connected with an underground drain, which in some cases should have a connection with the drain beneath the center of the avenue; but this detail must be specially studied, as it will vary with circumstances. The surface should be crowned slightly, only sufficiently to cause the water to flow away easily in a violent shower.—Col. H. W. Wilson, before the Massachusetts Horticultural Society.

THE BEST AUTUMN-FLOWERING SHRUB.

If we had to name the best spring-blooming shrub, a first choice among so many beauties might be hard, but among fall-bloomers the *Hydrangea paniculata grandiflora* stands supreme above all competitors, and, considering its many excellent qualities, it seems strange that it is still comparatively rarely found in cultivation. For small inclosures it is rather large, and not as well adapted as for large, open lawns, where its effect, especially when seen from a short distance, is really grand.

In a neighboring lawn, in full view from the window near which we write, and several hundred feet distant, stands a group of half a dozen large bushes in full bloom, completely covered with their large panicles of white and rosy pink. A superb specimen of *Abies Nordmanniana*, with its deep-green, glossy leaves, furnishes a splendid background; on one side stands a *Magnolia macrophylla*, which by the slightest breeze turns the under side of its monstrous leaves to view, giving a peculiar shining, glaucous tint to the entire tree. A little further distant on the other side is a beautiful, well-shaped Koutneky Coffee-tree, the tips of its branches just clinging to golden yellow in pleasing contrast to the bluish-green of the main foliage. It would be useless to attempt to describe in words the imposing effect of this magnificent combination of rich colors and graceful forms, which, we fear, shows to better advantage from our window than from the proprietor's own grounds.

Foreign Gardening.

A GARDEN IN PARA.

Sunday in Brazil, as in all Catholic countries, is a great festa. Early mass finished, the rest of the day is given to pleasure. There are no excursions, no noisy and drunken revels, but all is quiet enjoyment,—walks into the country, rides in the horse cars, or visits to friends; often on great church festas music and fire-works in the evening; but very seldom, although crowds of people come together, the slightest disorder.

Let us, this lovely Sunday morning, visit the garden of our friend Señor Olinda, who is always at home on Sunday, and to whom a visit from any lover of plants is always welcome. The time is eight o'clock; coffee is over, and breakfast will not be ready till eleven, so we have three hours before us. The garden is just outside of the city in the precinct of Salvaterra, but yet only twenty minutes from the business center. The morning is perfection, like the loveliest June day, as indeed every morning in the year is in Para. Let us, therefore, take a less direct route, and walk out by the great Estrada of St. José.

We leave the Palace Square, with its large Mango-trees (*Mandigofera Indica*), which at this season (August) are bright with the new bronzy leaves, and hanging full of the green, odd-shaped fruit, which in January will be bright yellow with a red cheek,—a fruit varying much according to the tree, the poor ones tasting like a mixture of tow and turpentine, the best more delicious than the choicest Peach,—and see before us the Estrada, with its long lines of Royal Palms (*Oreodora regia*), the great frouds meeting over the broad street, and the columnar trunks seeming to converge in the distance.

On each side are houses and gardens; a short distance out is the once famous betanica garden, now, alas! utterly neglected, but still preserving many rare trees, and in winter a mass of bright-leaved Caladiums, chiefly *bicolor* and *Chantini*, the leaves of which grow to an immense size and are very brilliant. Many other Palms attract us, of which the Assai (*Euterpe edulis*) is the most graceful and beautiful and the ugliest; in fact, a Palm of which one rarely sees a good specimen is the Coeca-nut (*Cocos nucifera*).

Should we linger to describe all the bright, attractive plants that we meet, the various flowering vines which cover the fences, the White Paneratiums in the ditches, the Coral Erythras and the little Orchids and Tillandsias perched in the trees, we should never reach the garden; but an easy walk of half an hour brings us to Salvaterra, and we are at Señor Olinda's gate.

The house stands back from the road, with a little garden in front. The entrance is through a huge plank gate, with a little door cut out in the middle of it for foot-passengers, and the whole is covered by a tall structure supported on great posts, roofed with red tiles, and sloping inward nearly to the house.

As we enter, we see that the posts are covered with climbers; on one is *Clerodendron Balfourii* covered with masses of white and scarlet bloom larger than our hat; on another *Allamanda Hendersonii* full of immense

yellow flowers; Jasmines of several kinds, which fill the air with fragrance; *Stephanotis floribunda* hanging with long garlands of white sweet-scented flowers; the Wax Plant (*Loya carnosa*) with jeweled blossoms; some very brilliant species of perennial Convolvulus, Trumpet Flowers and Passion Flowers, the latter both with flower and fruit; the beautiful *Hexacentris Mysorensis*, with long pendant racemes of rich bloom,—and, indeed, many others. Blue is supplied by *Thunbergia Harrisii*, which, if not kept well pruned, would soon fill the whole garden, and pink by the lovely *Antigon leptopus*, the beauty of whose masses of rosy flowers no words can describe.

Trained along the whole front is *Cissus discolor*, which hangs almost to the ground in long streamers, and in the play of sun and shade shows a wonderful brilliancy of foliage. And all these are in bloom all the time; it is perpetual spring in Para, and beyond pruning off the too rampant branches, they require no care, save at times, when the afternoon shower does not come for several successive days, a little water in the morning.

The little front garden is a mass of brilliant foliage and flower. Crotons, Poinsettias, Dracenas, and Acalyphas are dazzling, and the Madagascar Periwinkle forms beds which are always covered with bloom.

There are Roses, but, beyond giving plenty of flower, the plants are not attractive, as in this warm climate they cannot be pruned, but must be allowed to grow at will, and Hybrid Perpetuals are six feet high, with flowers only on the end of the shoots.

The most striking plants in the front garden are a *Russelia juncea*, eight feet high, and at least three feet in diameter, which forms a fountain of Coral Flower and delicate spray, and an *Alocasia macrorhiza variegata*, which has great white leaves, three feet long by two feet broad, on tall foot stalks.

A long fence is a blaze of Bongainvillea, many of the shoots ten feet high, rich masses of color, and, just beyond, an *Ixora cuneata* is even taller and covered with crimson blossoms.

On our right is the house, the windows full of Tydaeas and Achimenes covered with flowers, and before us stretches a path shaded by Orange-trees, the branches weighed almost to the ground with fruit, and with borders on each side full of choice flowers and plants. All the trees are hung with Orchids, many being in bloom; but here we must divide our letter, and at present only write of the flowers and foliage plants, reserving a description of the Orchids for a future time.

E. S. RAND.

AN AUSTRALIAN DROUGHT.

In February last, in New South Wales, a correspondent of a provincial newspaper traveled for some two hundred miles by railway, and throughout the whole journey he saw on either side nothing but a desert—"a wilderness destitute of any green thing, without any water worthy of the name, of cattle in the paddocks, dead or dying; the sun's scorching rays fell on fields as hard as iron. The leaves of the trees were as motionless as death itself, there being not a breath of air stirring. The state of affairs was quite as bad in other parts of the country. There were thousands of square miles of land, baked

and cracked, with the dry, brown grass flying off in dust, without a vestige of green, or a drop of water anywhere."

The expedients resorted to in this terrible crisis were sometimes of a most desperate character. Some farmers endeavored to send their cattle down to the coasts or to the towns, but they died on the road, and their owners had to bear not only the loss of the animals, but the cost of their conveyance. This double loss largely prevented others from imitating their example. They sat down in mute despair to watch their ruin. One man lost twenty thousand, another fifty thousand, and the third one hundred and fifty thousand sheep, without the slightest power to save one of them. Millions of sheep have died, and hundreds, and probably thousands, of colonists who were prosperous last year are peer and, perhaps, ruined to-day.—*Scientific American*.

MADEIRA AND ITS VINTAGES.

This island, in consequence of its peculiarly rocky, volcanic soil, and the remarkable evenness of its climate (varying only between 60 and 80 degrees), is in truth "The Home of the Vine." Its vines have that specially rich, nutty flavor, which has given them a world-wide celebrity. They were for the last two decades partially forgotten, on account of the almost total failure of the vintages (1851 to 1861); but the late series of full vintages have again given them the prominence their sterling qualities deserve—the demand having trebled within a year. The old-time practice, so universally followed by well-to-do people, of laying down a pipe or more of it from time to time, is again being practiced.

History informs us that in the good old days before the Revolution, it was the custom of John Hancock, and other merchant princes of Boston, on great occasions, to roll out a pipe of this grand old wine on the Common, and allow the people to imbibe at will.

1813, 25,000 pipes; 1814 to 1846, gradual increase to 31,500 pipes, thence a gradual decrease to 1851 (on account of disease of the vine) to 10,000 pipes.

1852 to 1861, very small; 1861 to the present year, gradual increase from 400 pipes, to 14,000 pipes in 1874. The vintages of 1879 to 1882, reaching 20,000 pipes.—*Wine and Fruit Grower*.

A VEGETABLE BOUQUET.

Quite a novelty in the way of a bouquet was produced by Mr. Aldous, florist, of South Kensington, states the *Gardener's Chronicle*.

A lady was desirous of presenting a gentleman with a bouquet—this being the ladies' privilege in leap-year—and gave the order that culinary vegetables only were to be employed in its fabrication, which was tastefully carried out. It consisted of the following items, in their smaller forms: Carrots in two shapes, long and short; Radishes the same; Brussels Sprouts; variegated Scotch Kale; Curled Endive, and the broad-leaved Batavian variety, Parsley being used instead of the usual Fern fronds seen in ordinary bouquets. The whole, including the holder, measured fifteen inches in diameter, and was mounted in the usual way with wires.

Rural Life.

VILLAGE IMPROVEMENT SOCIETIES.

It is the fashion in these days to study institutions and trace them back to their beginnings, however remote. New England town-meetings, Virginian parishes and counties, are all connected with English and even with Germanic institutions. Slow evolution has been the law with whatever has been worth the attention of civilized communities.

Now, when the historians of various American institutions have completed their investigations in social and political departments, they can assuredly find an interesting chapter yet to be written about the evolution of the Village Improvement Society idea on American soil. With the proper sort of fostering care it is quite possible that a national society of great usefulness and significance may yet spring from this germ.

It was about twenty years ago that the ladies of a quiet Massachusetts town met, and determined to do something for the good looks of their streets. They were no dreamy esthetes, but a group of practical and very-much-in-earnest American women. Their ideas of village beauty grew steadily, they improved the appearance of the town in a multitude of ways, by better fences, better roads, tree-planting, street-lighting; every householder in the place felt the presence and inspiration of their work, until the modest little town became a model of a place, and the joy and pride of its inhabitants, and the fame of it went abroad, and other towns began to think of Village Improvement Societies.

Only twenty years, or so, have passed and there is hardly a State in the Union where some organization of the people themselves has not taken the matter in hand. Away over on the Pacific Coast towns in Washington Territory, Oregon, and California have adopted the plan. One of the most successful has grown up in Berkeley, under the shadow of a university of California, where many of the wealthiest and most refined citizens of the metropolis of the State are building residences. There, so mild is the climate and so fertile the soil, an immense range of arboreal growths is available for decoration, and for utility in street and garden.

But few are the villages founded where something cannot be done in the way of suburban improvement and tree-planting. It will be long before Angostota and Hammarfest have Village Improvement Societies, but the dreariest silt in the midst of Nebraska plains or Colorado Caeti needs only patience and energy to become an oasis, a refuge city in the wilderness of neglect.

The natural province of such societies is in the line of outdoor work. They are to clear away the rubbish, the piles of tin cans, the deserted and ownerless "shanties," the waste-heaps of camp or village. They are to secure wide streets and roads, and space for public buildings, and ample squares, or commons, where people can assemble and children play, and where trees, vines, shrubs, and flowers may be planted. They are to interest all property-holders in the usefulness and practicality of their scheme, so that no one wishes to do anything to injure the good-looks of the place. Rustic seats they can

build by the road-side at shady spots; springs they can wall up, and streams they may wish to bridge; sooner or later the work they have in hand will be acknowledged by young and old to be of a cash value to every industry in the place. Men will at last be educated to perceive that to build an ugly house, to neglect one's private garden or fences, to cast rubbish in the street, are all infringements of the unwritten harmonies of the village.

In the long run an active, enthusiastic Village Improvement Society is quite able to drive out the corner groggery, and broak the bottles of fusel-oil, and ruin the occupation of the drunkard-maker. Lovoly, peaceful, refined homes, and such a horticultural atmosphere of growth that to the poorest washer-woman's family the committee of the village improvement society give flower-seeds—these are more than a match for any disintegrating social influence.

The active society, too, is apt to have a care to new enterprises, to the condition of factories and workshops as fast as they are established, to the prompt removal of public nuisances, and to a multiplicity of questions relating to sewerage and drainage. For it is more than the mere loveliness of the village; it is its health, its general welfare, its daily needs, which concern such an organization.

The old New England town-meeting is not a national institution. But if every village that really suffers for the lack of social organization could have an "Improvement Society," something more than tree-planting might come from it all. There might be reading-circles and literary associations, night-schools and social assemblies. The love of a garden, of an avenue of street-trees, of a picturesque public square, might lead an entire community into more unselfish and loving relations as neighbors and friends. It might protect the ancient Oaks and Pines of the region, and gather up the fast-fading traditions and records of the early history of the community. It might go far toward destroying the dullness of village life. It might even give that life so sweet and beautiful an aspect, so deep and lasting a charm that over-worked, brain-tired men and women would learn to seek it as a shelter, and love its old-time simplicities, and its gentle refinement. It certainly seems as if in that organization known us the "Village Improvement Society," lie great possibilities of good to all rural communities throughout America.

CHARLES HOWARD SHINN.

THE RIGHT SPOT.

One of the most important points to be settled by those who are about to build, and after the lot has been chosen, is to determine the exact location of the building upon the site. We refer, of course, to the open lots on which there is room not only for the building, but for more or less spacious grounds upon all sides. On such ground the altitude, the distance from the various boundaries, the relation to other buildings, to the street and to trees, present or future, are all matters that should not be carelessly established, and, although there are special circumstances for each case, there are certain general points of universal application in all village, suburban, and rural building.

Nothing is easier than to make a grievous mistake by placing a house too low, too high, a few feet too far in one direction or another. Nothing is more difficult to correct than such a blunder. Tastes differ in this, of course, as in everything else, and no definite rules can be given, but certain cautions may be observed,—for instance, in fixing the guides which are usually placed at the level of the first floor it is well to remember that the actual front wall of the house, especially if it is of considerable height, will appear much nearer the street than do the stakes or boards that indicate its position. The wall seems to move forward as it rises. Similarly the underpinning, that is, the wall below the level of the first floor, seems less in comparison with the height of the structure after the whole is completed than when there is only a single board or line to show its altitude. There is, therefore, reason for the popular notion that there is no danger of setting a house too high or too far from the street.

Trees are often allowed to crowd a house into an unfavorable location. A beautiful tree of large size and healthful growth ought not, indeed, to be sacrificed for an inferior gain; but when, in order to spare it, the finest views from the house are lost, the sunshine excluded from the windows, and the approach thrown into an inconvenient shape, the loss is on the other side, and the gain consists in destroying the tree. Especially is this true in regard to trees of moderate size, which can be removed, or, in a very few years at most, replaced by others.

We have in mind a row of four Elm-trees that were transplanted from the nursery five years ago. Two of them measure thirty-five inches in circumference at three feet from the ground and the other two forty inches. They are about as many feet in height as inches in girth, and have a corresponding spread of branches. With such possibilities as that in the way of tree planting and growing, it is manifestly absurd to set a house where it will be forever in the wrong place, in order to save a tree for which, if it cannot be spared, a substitute can easily be found.

Keeping a house as near the ground as possible for picturesque reasons may be justified under certain conditions, but it commonly involves sanitary dangers which ought to be avoided, even at the expense of proud humility and lowly picturesqueness.—*The Builder.*

THE REAL HOME.

"What makes a home," remarked the late Doctor Holland, "is the light of love kept constantly burning on its altar, and which welds the tender, sacred ties of the family. Persons who are too busy with the daily affairs of life to find time to adorn and beautify their homes will soon permit the lamp of love to burn low and dim on the altar of their hearth-stones, and then, blindly ignorant of the cause of their unhappiness, they bewail at their lot and marvel at their own wretchedness. The way to be happy is to make your home beautiful and attractive, within, of course, the limits of the means at your command. Intelligence, love, and refinement cannot be found in a home where there are only bare walls and floors, where there are no books or papers on the table, no flowers in the yard, and no music in the hours of its inmates."

Exhibitions & Societies.

NEW-YORK HORTICULTURAL SOCIETY.

The monthly exhibitions of this society were resumed last month, and will be continued during the winter, every first Tuesday of each month, at Horticultural Hall, 26 and 28 West 28th street.

The September exhibition, although it did not present anything unusually meritorious, contained a good variety of all the seasonable flowers, and was fairly attended.

AMERICAN INSTITUTE.

The Fifty-third Exhibition of the American Institute was opened on Wednesday, September 24, at the Exhibition Building, Third Avenue, between Sixty-third and Sixty-fourth streets. Although all the machinery is not yet in working order, there is no doubt that the exhibition will be one of the best ever held by the Institute.

A special Fruit and Flower Exhibition will be held from October 8th till 11th; a Geranium Exhibition from October 15th to 17th; and a Chrysanthemum Show from October 29th to November 1st.

THE NEW ORLEANS WORLD'S EXPOSITION.

The opening of this exhibition, in many respects the most important one ever held on this continent, has been decided upon December 1st, 1884. The exhibition will continue during the winter to May 31st, 1885. The directors, in announcing the establishment of the Northern headquarters at corner Broadway and Chambers street, New-York, take occasion to draw the attention of manufacturers to the great influence this exposition will no doubt exert in creating new outlets for our surplus manufactures.

On the continent south of the United States, are fifteen Spanish-American republics, the Portuguese-American Empire of Brazil, and four European colonies. They have a total population of 40,000,000 consumers, and an area of about 7,500,000 square miles, or more than double that of the United States. In climate, resources, products, supply and demand, they are the reverse and complement of the United States. Commercial exchanges with such countries are, therefore, in accordance with sound laws of trade and political economy. They are exceedingly deficient in manufactures. They need our railway iron and supplies, farming implements, cotton and woolen goods, boots and shoes, and a thousand and one products of our invention and skill.

Their total annual imports are over three hundred million dollars in value. Of this demand we supply but one-seventh part, the rest being monopolized by Great Britain, France, and other European powers.

Of our total exports of all kinds, eighty per cent. go to Europe, and only five per cent. to the fifteen American sister republics. Europe is well supplied with manufactures and has a surplus for export, hence we need not look there for adequate outlets for our surplus manufactures. We should rather look to the unsupplied markets of Spanish and Portuguese America.

Household Pets.

FERRETS.

The Ferret is a useful animal, which makes it more attractive than when kept only to look at. It is very useful for hunting rats and rabbits. The general feeding of Ferrets depends upon their use. The staple food should be bread and milk, or mush and milk, morning and evening, as much as they will eat up clean at the time of feeding, and no more. Raw animal food should be given them once or twice a week. This is the proper feeding when kept for rabbit-hunting; but if the Ferret is kept for rabbiting, it should be fed raw animal food at night, omitting the bread and milk. Keep water constantly before them. If they become too fat, dilute the milk, feed them with water so the feed will be sufficient in quantity but not so rich. They should always be eager for their regular meal.

They should be handled from the time they are placed before the feed-up. Never tease them, as it tends to make them snap at everything that moves before them. If they take hold with their teeth, do not pull away from them, but push toward them—then they will let go. If necessary, put on thick gloves and let them bite. In a short time they will learn to be handled without gloves. To take hold of a Ferret that bites, hold a piece of meat before it; when it takes hold of it and pulls back, it can then be grasped around the neck, close to the head, and about the front legs; then it cannot bite. Handle them often, as frequent handling will make them tame.

Ferrets will hunt when four months old. It is their nature to hunt and kill; hence, if properly fed, they are not apt to sneek the blood and lay down and sleep, but will continue to hunt until tired out. Begin with young by giving them half-grown rats. The first encounter with the rat is very important. Place the rat in a room where it will have a place to hide, put in the Ferret, let them have full sway, and hunting begins at once. When the Ferret has caught and killed one or two rats, he may be considered ready for outdoor work. The small Ferrets are the best for ratting.

It is always essential to the successful breeding of Ferrets to provide a suitable place for their habitation. Ferrets cannot endure the extreme cold, and should have a hutch constructed so as to regulate for cold and heat; the front of hutch can be made of lath or wire. They are very cleanly animals, and will use one corner of their hutch for excrements; clean their hutches twice a week, and use sawdust, or something of that kind, for litter, and give a clean bed of straw each week. Keep each matured Ferret in a hutch by itself, except in fall and winter; after the breeding season is over, then more can be kept together. The habits of the Ferret are nearly like those of the dog in breeding; they usually have from four to eight at a litter, and one or two litters a year; they go with young six weeks. A few days before it is time for the female to litter, give her a good nest of clean straw. More people should keep Ferrets, as they are sure to clean the premises of rats.—*H. E. Spencer, in Pease's Feathered World.*

Miscellaneous.

THINGS THAT NEVER DIE.

The pure, the bright, the beautiful,
That stirred our hearts in youth;
The impulse to a worldless prayer,
The dreams of love and truth—
The longing after something lost,
The spirit's yearning cry,
The strivings after better hopes—
These things can never die.

The timid hand stretched forth to aid
A brother in his need,
The kindly word in grief's dark hour
That proves a friend indeed—
The plea for mercy, softly breathed,
When justice threatened high,
The sorrow of a contrite heart—
These things shall never die.

The memory of a clasping hand,
The pressure of a kiss,
And all the trifles sweet and frail
That make up life's first bliss.
If with a firm, unchanging faith,
And holy trust and high,
Those hands have clasped and lips have met,
These things shall never die.

The cruel and the bitter word
That wounded as it fell,
The chilling want of sympathy
We feel but never tell—
The hard repulse that chills the heart
Whose hopes were bounding high,
In an unfading record kept—
These things shall never die.

Let nothing pass, for every hand
Must find some work to do;
Lose not a chance to waken Love—
Be firm and just and true,
So shall a light that cannot fade
Beam on thee from on high,
And angels' voices say to thee—
These things shall never die.

—All the Year Round.

WEATHER FORECASTS.

It seems to be overlooked by meteorologists, says a writer in the *Journal of Science*, that when a season has taken a decided character, whether as wet or dry, the ordinary indications of change seem to lose their meaning.

In the year 1879 all signs of fair weather drawn from the appearance of the clouds, the actions of birds and insects, etc., were quite misleading. And in the present season I have more than once seen the commonly accepted signs of rain go for nothing. The sky may become gradually overcast, with dark, ragged masses of underclouds; there may be a "hollow and a blustering wind," swallows may fly low, slugs come out in numbers, bubbles of gas rise from ditches, etc., but the weather remains dry, or, at the most, there is a slight shower.

INGENIOUS IDEA.

It is told of a man in Connecticut who wanted to put a water-pipe through a drain several feet below the surface of the ground without digging up the drain: To accomplish it, he tied a string to a cat's leg, thrust her into one end of the drain, and giving a terrific "scat," the feline quickly appeared at the other end; the pipe was drawn through the drain by means of the line, thus saving considerable expense.

IN A MEXICAN KITCHEN.

A Mexican kitchen is a study, and to do it and all its queer utensils justice would require a column's space. There are no cooking stoves in Mexico, or even anything like the fire-places of our grandmothers' days. One side of the room is occupied by a sort of shelf, built into the wall about breast high, in the center of which a small wood fire is kept burning.

There is no wood here which a New England housewife would consider fit to burn—only the gnarled and twisted branches of mountain trees, and around a little heap of these the earthen cooking-pots are ranged. If the family is small, sometimes this smoky process is improved upon by building a charcoal fire in a large earthen pot, and setting the smaller cooking vessels within it. In many houses a mud oven is built at one end of this shelf, or somewhere out-of-doors. To heat the oven, a fire must be built inside of it, and the entrance closed with a hot stone. However, as baked food—"pies and things," according to the Englishman's advertisement—enters not into the household economy, an oven is altogether a superfluous luxury.

In the center of the kitchen stands its most important factor, the metate for tortilla-making. It is a hollowed stone, the size of an ordinary bread-bowl, having two stone legs, about six inches high at one end, which inclines it at an angle of forty-five degrees. The tortilla-maker kneels on the dirt floor at the elevated end of the metate, and the Corn, having been previously boiled in weak lye, and still quite wet, she crushes into paste with a stone rolling-pin, the mixture gradually sliding down the inclined plane into a dish placed to receive it. When a quantity has been thus crushed, it is rolled into balls and left until required. It is astonishing what an amount of Corn a family of ordinary size will consume in a day, in the form of tortillas, the Mexican "staff of life."

When a meal is on the tapis, the last act in the drama—the tragedy, we feel inclined to say, when suffering the pangs of indigestion—is to heat the griddle, or more commonly a smooth flat stone. Then the cook takes a very small lump at once of the prepared Corn paste and shapes it into thin round cakes, with a little water and much loud patting of the hands. The cakes are then baked brown in a jiffy, and as a substitute for bread, one might go farther and fare a great deal worse than subsist on tortillas.

Whatever else American housekeepers may find worthy of imitation in Mexican methods, I am sure that dish-washing, as that disagreeable duty is practiced here, will not be one of them. The Mexican dish-washer does not bother with a table, and thereby saves her arms from scrubbing and her legs from standing, but seats herself serenely on the floor beside a pail of hot or cold water. She has no soap, but a little sliced amole root makes stronger and cleaner suds, and in lieu of a dish-cloth she uses a tiny broom-brush, like our smallest whisk-brushes. The dishes are never wiped, but are turned up to dry, sometimes in a tray or on an adobe shelf, but generally on the hard dirt floor leaned against the wall. Strange to say, they always come to the table clean and shining. But fancy their condition if the average Irish or negro servants were allowed to do likewise!

The brass spoons and steel-bladed knives are kept bright enough to see your face in, though no bath-bricks or patent soaps are employed in their polishing—nothing but pure, unadulterated dirt. The servant whose duty it is, takes them out-of-doors, kneels upon the ground, digs up a little fresh earth, and holding the knife or spoon firmly on a stone, polishes at her leisure. Despite dirt floors and the absence of all those conveniences which we consider indispensable, I have never yet seen an untidy kitchen in Mexico. Everything is kept as bright and fresh as hands and amole can make it, oven to the cooking pottery, which is of necessity smoked black whenever used. If we could combine their innate neatness with our improved methods, the result would be that cleanliness which we are told is "akin to godliness."—*Pansy*.

THE POPCORN TRADE.

The high price of Corn has somewhat discouraged the manufacturers of Popcorn, who are compelled to pay increased money for their product while disposing of their goods at almost the same figures as obtained when Corn was low. One manufacturer in New-York manufactures as high as 70,000 pounds of Popcorn a year. He has now on hand a single contract for shipping 1000 barrels to London. Shipments are made regularly to Hayti, France, Germany, Japan, China, and Italy. The Italians prefer it to Macaroni, and are heavy consumers of Popcorn.

"Many physicians," said the Popcorn man, "are recommending their patients to use Popcorn as a cure for dyspepsia. Several parties who are passing the summer in the Catskills have shipped a quantity by direction of their medical adviser, and go about munching it at all hours of the day. It is easy to carry about. Ladies can carry it in their dress pockets, and gentlemen can put it in their coat-tail pockets. No danger of soiling anything, you know. Children all like it and cry for more. It is far preferable to molasses and other candy."

All the manufacturers of Popcorn have grown rich. There are but nine in New-York. Newark, Jersey City, San Francisco, and Chicago all have one. There is one in Quebec, Montreal, and Toronto. Two men in Lowell, Mass., made independent fortunes in the business. One in Springfield, Mass., distinguished himself in the same manner.—*New-York Mail and Express*.

EATING HOT BREAD.

What to eat and what not to eat is a question every one should be able to answer for himself. What would kill one person may not hurt another in the least. A person in good health may eat and thrive on what would injure him if not in robust health.

The *American Miller* thinks hot bread very injurious. It says: "That hot bread, in nine cases out of ten, will produce dyspepsia in a newly discovered fact, and especially indulgence on the part of those whose pursuits are quiet, indoors, and sedentary. And yet the reformers, or those who call themselves such—the men and women who work themselves into a white heat over the sale of a glass of cider—will go on year after year not only making no outcry

against this pernicious indulgence, but actually filling themselves up, day by day, with the hot and poisonous gases of the oven. This servant of the housewife can be made as terrible a stomach-destroyer as the distillery, and the sworn foes of the latter are apt to be its best patrons. Dyspepsia paints the nose and sours the temper as dram-drinking, and many sufferers from the former, though by their own willful acts, inveigh the most loudly against the latter."

It is nothing new to find "reformers" among those who have not reformed themselves. But all grown persons should have knowledge enough to know, and courage enough to practice, what is good for themselves.

RATS IN CELLARS.

"Shortly before winter, as the stores go to cribs and cellars," says Blairco, in the *New-York Tribune*, "young rats, raised by careful mothers in hollow trees or other safe and sheltered corners, busy themselves looking for winter quarters where there will be defense from cold, and where food will be at hand.

"When a cellar is stored with fruit, vegetables, etc., it is very difficult to drive out rats, and the damage they do in such a place is enormous. All the finest fruits are soon bitten into, defiled, and spoiled. A little anticipatory care, to prevent their establishing a colony, pays well. The openings for ventilation should have rat-proof screens; the floors and walls should be searched for holes; empty barrels or boxes moved, holes stopped with glass and mortar, and a fresh coat of whitewash given. If doubtful places remain, a good sprinkling of copperas and lime is hateful and deterrent to these troublesome animals. If from any cause the cellar itself cannot be made secure, choice samples of fruit may be kept safe in old tin boilers or similar vessels, or in boxes suspended from the joists above by wire hooks.

"The rats that go out to form new colonies are mostly young, and much more easily caught than older ones. If fed for two or three nights on a tray of sawdust a steel trap placed in the tray will not be seen or suspected, and will generally catch and hold at least one marauder."

HOW TO MAKE "KOUMISS."

The word "koumiss" is the name of the favorite beverage of the Tartars. It is sometimes called "Russian Milk Champagne." It is a pleasant drink, and is particularly recommended for dyspeptics. Young children can drink it freely without harm. *Food and Health* gives this recipe for making it: "Into one quart of new milk put one gill of fresh buttermilk and three or four lumps of white sugar. Mix well, and see that the sugar dissolves. Put it in a warm place to stand ten hours, when it will be thick. Pour from one vessel to another until it becomes smooth and uniform in consistency. Bottle and keep in a warm place for twenty-four hours; it takes thirty-six in winter. The bottles must be lightly corked, and the corks tied down. Shake well five minutes before opening." A teaspoonful of yeast may be used in the absence of buttermilk.

HEATING GREENHOUSES.

The heating apparatus best suited to the wants of the amateur is the ordinary hot-water circulation from a boiler about four feet below the level of the house floor, in a well-drained cellar, at one end of the glass, and covered by a shed or office, which, being always warm, will be found a convenient workshop in cold weather. The boiler should always be a size larger than the pipe-fitters advise, to make sure of being sufficient. Much will depend on the draught of the chimney; the same boiler will do twice as much work with a good draught as with a low and small chimney.

To maintain tropical heat in the compartment eleven and a half feet wide and nine feet high will require six or eight four-inch pipes, while the portion devoted to hardy plants will not need more than half as many. In heating, much will depend on location and the shelter afforded by hills and trees on the north and west. The compartments on the north will require about four pipes, and in the portion devoted to the cutting-bench two will pass under the bench, and be so inclosed as to give bottom heat to the cuttings.

An abundant supply of water is almost as important as heat. If the public water-works do not afford this, it may be raised from a well or cistern by a windmill, to a tank fifteen or twenty feet high in the loft of the boiler-house. It is desirable to have it slightly warmed for tropical plants, which may easily be done by having the tank connected with the boiler by circulating pipes provided with valves.

If found convenient, the boiler and shed may be placed in the middle of the structure, carrying the heating pipes both ways therefrom. This is a more symmetrical arrangement, but this point will be governed in great measure by convenience as regards accessibility by coal wagons, drainage of the cellar, and nearness to the supply of water.

The internal arrangement will be best left to the taste of the owner, but any plant will thrive better in a bed where the roots can spread than if confined in a pot, but the confined condition of the roots favors early flowering; moreover, plants that are to be removed out-doors in summer are best potted. The pot, therefore, is a necessity, and is best kept from drying up by plunging to the rim in clean sand.

Such a house as has been described will cost from fifteen to twenty-five dollars per foot of length, according to the style and thoroughness of the work.

Some amateurs will desire only a small greenery of one compartment, attached to the dwelling-house, and heated by a coil of pipe from the furnace in the cellar, or, where steam is used, by a steam pipe, and much enjoyment may be derived from such a structure. It must be partitioned from the house so tightly that it can be smoked without smoking the dwelling. A very convenient greenery may be cheaply made by fitting sashes between the posts of a piazza, to be removed in summer with all the shelves and pots. A heating coil of one-inch pipe, or a water-bath in the fire-pot of a common furnace, connected with a system of circulation around the piazza floor, will suffice for heating, or if steam is used for heating the

house, it may be very conveniently extended to the greenery.

For small greenhouses, detached from the dwelling-house, the hot-water circulation will be found cheaper and more satisfactory than steam, and far better than the old-fashioned flue, red-hot at one end and cold at the other, which is also a cumbersome affair and now little used. Steam has advantages where several houses are to be heated from one fire, since it is easier to divide and regulate the heat; but for so simple a structure as has been described nothing is so efficient and economical as a good hot-water boiler. The combination of flue and boiler is of much practical importance, the saving in fuel being balanced by the impaired draught and the danger of the escape of poisonous gasses into the house to the destruction of its contents.—*Wm. D. Philbrick, before the Mass. Hort. Society.*

BUILDINGS OF THE ANCIENTS.

It would seem that the modern system of hotels and apartment houses on a vast scale is mere child's play compared with the practice of the ancients in the same direction. The recent excavations at Pompeii have unearthed some enormous buildings, of such beauty and solidity in architecture, such perfect drainage, and such provisions for health and comfort, as to fill all who have seen them with astonishment. These newly discovered buildings contain thirty or forty immensely spacious apartments on the first floor, and as many on the second. The rooms looked out on a rotunda nearly forty feet long; courts supported by columns surrounded the bedrooms, which opened upon large ornamental gardens with fountains. Provision for light and air was made upon the most extensive scale. On the second floor were found evidences that there were suites of rooms built upon the flat plan of to-day. In fact, the revelations made by the exhumers at Pompeii show that place to have been one of the most wonderful of watering-places for splendor, comfort, health, and enjoyment, and give every evidence that floor-renting, like many other modern improvements, is not a new thing under the sun.—*Boston Saturday Evening Gazette.*

BUTTERED FLOUR.

"A Connecticut company," says the *Hartford Times*, "makes flour all ready for baking biscuit or strawberry shortcake; it only requires to be mixed with milk or cold water, and the batter is ready for the oven. The process of its manufacture is interesting. A quantity of wheat flour is sifted and dumped into a large tub. Butter cut into large cubes is added to the flour. Then the white-coated operator weighs out certain mysterious quantities of baking soda and fine table-salt, which go to swell the contents of the tub. Then the mixture is placed in a large polished cask, which revolves slowly in one direction, while a sort of dasher inside moves in the opposite direction. The cask revolves about thirty minutes, at the end of which time it is opened. It is found that the ingredients have been thoroughly mixed; every particle of moisture contained in the butter has been evaporated, and that the mixture is as fragrant as new-mown hay. It is then placed in bags and boxed for shipment."

OUR BOOK TABLE.

The American Seedsman.—Prospectus of a new magazine devoted to the interests of seed dealers and growers, soon to be published by F. F. Tillughast, La Plume, Pa.

Mutual Fire Insurance Co. of New-York, 155 Broadway. Second Annual Report, showing the general healthy condition of the company, its cash assets amounting to over half a million dollars.

Kansas Agriculture.—Report of the State Board for the month of August, containing the estimated yield of Corn, acreage of Grass under fence, numbers and products of Live Stock, Fruit and Miscellaneous Statistics. Wm. Sims, Secretary, Topeka, Kansas.

Protection and Free Trade To-day, by Robert P. Porter, published by James R. Osgood & Co., Boston. This paper, which was read before the Arkwright Club, Boston, and ordered printed, gives a clear exposition of the principal facts about Protection and Free Trade, at Home and Abroad, in Field and Workshop, and is well worth the careful study of every thinking man.

The Age of a Horse, by Professor J. M. Heard, published by M. T. Richardson, New-York. A pocket manual, giving full information of the methods employed by professional horsemen and veterinarians to determine the age of horses, with numerous illustrations, showing the shape of the teeth at different ages. And a chapter on Horse Character, or how to determine the disposition of a horse, with portraits of several famous trotters and thorough-breeds.

Outing, Boston, Mass.—The fact that the October issue of *Outing* is the opening number of Volume V. is in itself an evidence of success and growth on the part of this magazine that is very satisfactory to all who believe in the vigorous outdoor life which it exemplifies and illustrates. *Outing* is fortunate among the younger magazines in having found an audience waiting for it. The field it entered two years ago was quite ready for the plowing. The gospel of recreation was alive in the public conscience, and *Outing* finds a warm response, from month to month, to its pleasant preaching in prose, poetry, and pictures. The October number is varied and bright in its attractions.

Man Wonderful in the House Beautiful, by Drs. Chilion B. Allen and Mary A. Allen. Elegantly bound in cloth; price, \$1.50. Published by Fowler & Wells Co., New-York.

The book is an allegory, in which the body is the "House Beautiful," and its inhabitant the "Man Wonderful." The building of the house is shown from foundation to roof, and then we are taken through the different rooms, and their wonders and beauties displayed to us, and all this time we are being taught—almost without knowing it—Anatomy, Physiology, and Hygiene, with practical applications and suggestions.

We are then introduced to the inhabitant of the house, "The Man Wonderful," and learn of his growth, development, and habits. We also become acquainted with the guests whom he entertains, and find that some of them are doubtful acquaintances, some bad, and some decidedly wicked, while others are very good company. Under this form we learn of food, drink, and the effects of narcotics and stimulants.

The illustrations are of the best, and these, together with the happy verbal illustrations, give the reader a clear idea of the subjects treated.

American Association of Nursery-men, Florists and Seedsmen; Proceedings of the Ninth Annual Meeting, held at Chicago. The transactions of this, the largest and most enjoyable gathering of American Nursery-men ever held, are full of interest to every one engaged in horticultural pursuits. The front page presents an excellent portrait of the president, Mr. Myron A. Hunt, and another page is dedicated to the memory of the late Dr. John A. Warder. Among the most important papers read and discussed are, The Transportation Problem, by U. B. Pearsall; Uncertainties, by J. Jenkins; Wintering Roses, by S. T. Phoenix; Influence of Stock on Bud or Graft,

by N. H. Albaugh; The Roses of California, by W. A. T. Stratton; Climatic Conditions of the Year, by J. C. Plumb; Our Work a Necessity, by J. R. Johnson; Advertising, by Peter Henderson; Artificial Fertilization, by John Thorpe; Pioneer Nursery-men, by Edgar Sanders; Reports on Stock, etc. A trip to the new city of Pullman was only one of the many enjoyable features to which those present were treated by their hospitable entertainers; in fact, there were so many entertainments planned that there was not time enough to get around, and therefore the members, very properly, voted to return to Chicago next year and dispose of the unfinished business.

Agriculture of Pennsylvania.—Reports of the State Board of Agriculture, the State Agricultural Society, the State Dairymen's Association, and the State Horticultural Association, and the State College. The combination of these various Reports, all of value to every intelligent farmer of the State, makes a noble volume, which does much credit to its editors and the progressive spirit of the Keystone State. In the limited space at our command we can notice only a few of the essays and papers which, in addition to the reports of the various committees, appear to us of most value. Insect Pests of the Garden and Farm, by Th. J. Edge; the Tobacco Season, by F. R. Diffenderfer; Black Knot in the Plum and Cherry; Diurnal Rapacious Birds, by B. H. Warren; the Guenou System, by W. P. Hazard; Studies for Farmers' Boys, by C. B. Cochran; Peach Yellows, by Prof. D. P. Penhallow; Gathering and Marketing Fruit, by G. Helster; the Lung Plague, by Prof. R. S. Huidekoper; Root Crops, by E. Reeder; Bee-keeping, by G. Prizer; Carp Culture, by Capt. M. P. Pierce; Food and Feeding of Domestic Animals, by Dr. E. Harvey; the Corn Worm, by Prof. S. S. Rathoon; Potato Culture, by M. W. Oliver.

The Horticultural Report especially is brim-full of interesting articles, among them papers on New Fruits, Pear Blight, Forcing Hardy Roses, Raspberries, Grapes, the Codling Moth, Yellows, Insects in general, Orchards, and many others of not less importance. Taking it all in all the volume is worth many times its cost to the agricultural interests of Pennsylvania.

CATALOGUES RECEIVED.

Jenkins' Nurseries, Winona, O.—Fall Catalogue of Fruit and Ornamental Trees, Small Fruits, etc. Tree Seedlings a specialty.

Geo. S. Josselyn, Fredonia, N. Y.—Catalogue of American Grape-vines and Small Fruits. Headquarters for Fay's Prolific Currant.

John E. & A. Murdock, Pittsburgh, Pa.—Descriptive Catalogue of Fruit and Ornamental Trees; also Fall Catalogue of Hyacinths, Tulips, Lilies, and Winter-blooming Plants.

Wm. Parry, Parry P. O., N. J.—Circular and life-size illustration of an entire branch of Wilson Junior Blackberry, showing the marvelous productiveness of this excellent new Blackberry.

Chas. A. Green, Rochester, N. Y.—Illustrated Catalogue of Trees, Plants, and Vines, with many valuable hints on Fruit Culture.—James Viek Strawberry, Shaffer's Colossal Souhegan, Gregg, Marlboro Raspberries, Kleffer Pear, and Nelson Apple are specialties.

J. T. Lovett, Little Silver, N. J.—Illustrated Catalogue of Small Fruits, Trees, and Plants, giving "honest" descriptions and much useful and practical information. Also special and very original circular about the Hansell Raspberry, for which this establishment is head-quarters.

The Mapes Manures.—Analyses by the State Experiment Stations of New Jersey and of Connecticut, together with the Guaranteed Standard, showing that they are not only up to their published guaranteed high standard, but that they have improved in concentration and solubility.

Goff's Hand-book of Ready Reference, for Advertisers, with Universal Compendium for Business Men, published by *Azro Goff*, 150 Nassau St., New-York.—A neat volume, containing a classified list of all the leading newspapers of the United States, and a large amount of useful information about business matters in general.

P. J. Berkman's, Fruitland Nurseries, Augusta, Ga. Descriptive Catalogue of Fruit and Ornamental Trees, Shrubs, Roses, Evergreens, Hardy Flowering Plants, etc.—This pioneer southern nursery, while, in point of quality and variety of its stock, it is equal to any establishment in the United States, for trees adapted to the southern climate and the wants of southern fruit-growers, stands ahead of all competitors.

Ellwanger & Barry, Mount Hope Nurseries, Rochester, N. Y.—Descriptive Catalogue of Fruits; also Descriptive Priced Catalogue of Small Fruits; Descriptive and Illustrated Catalogue of Bulbous Flower Roots, etc., for fall planting; Supplementary List of Novelties and Specialties, prominent among which we notice Windsor Cherry, Amber Queen Grape, Industry Gooseberry, and all the leading novelties in fruits and ornamental plants.

ANSWERS TO CORRESPONDENTS.

Plant for Name.—*L. R. D., Great Bend, Pa.*—The name of the plant sent is *Saponaria officinalis*, Soapwort or Bouncing Bet. It is native to Europe, but has become so common here along road-sides as to be almost a weed. The root was formerly used as medicine.

Renovating Lawns.—*Several Subscribers.*—On page 150 of our August number we published an excellent article on the subject, by Mr. Chas. E. Parnell. We could not improve it if we tried, and as we do not feel inclined to reprint it, the inquirers are referred to the same. Do preserve your papers.

Tomatoes in Greenhouses.—*J. F. T., Framingham, Mass.*—The object of brushing the flowers of Tomatoes growing in greenhouses with a camel's-hair brush is to produce better fertilization or pollinization. It is but little trouble to do this and insures a better setting of fruit, although we have seen good crops of greenhouse Tomatoes raised without this operation.

Winter Garden at the Holidays.—*S. C. P., Laprairie, Canada.*—To have Holland bulbs bloom at Christmas, they should be planted at once in pots, which are to be kept out-of-doors until hard freezing weather, when they have to be brought to a warmer place or covered so that the pots will not break. When the pots have become well filled with roots they may be brought to a warm room, watered more copiously, and forced into bloom.

Wintering Antigonon leptopus.—*P. P. S., Medford, N. J.*—This is not hardy in the latitude of Philadelphia, but the tubers may be easily lifted after the vines have been touched by frost, and kept in dry sand in a warm cellar, similar to Dahlias. It propagates easily from cuttings.

Ipomoea noctiphylon (grandiflora), the Queen of the Night, is an annual species, and has to be raised from seed every year, or it may be propagated by cuttings in the fall, planted in small pots, and wintered in the greenhouse.

Reducing Bones.—*W. L. C., Eldred, Pa.*—To prepare a ton of bones for manure it will hardly pay to buy a bone-mill, and to dissolve them in acids is disagreeable and not undangerous work. We have prepared many tons of bones by crushing the largest ones with a heavy sledge, and mixing the pieces through a freshly made compost heap, or with the manure of a hot-bed. For vegetables, and in fact for everything growing in the garden, such a compost is invaluable. Bones may also be decomposed by placing them in a water-tight hogshend, in alternate layers with unbleached wood-ashes, keeping all constantly moist with house-slops. They will crumble into pieces during one summer. Small quantities of bones cannot be used to better advantage than to bury them near Grape-vines or fruit-trees.

Bearing Age of Fruits.—*E. B. G., Wyoming Ter.*—Blackberries, Raspberries, and Currants, if planted in spring, will bear a partial crop the following year, and a full one the year after. If selected, to weigh not over four pounds per hundred plants. Plum-trees bear their fruit on spurs produced on wood two years old and upward, so that under favorable conditions they will commence to bear the third year after planting.

Strawberry-tree.—*S. W., Mexico, Mo.*—The botanical name of this small tree is *Euonymus americanus*. It grows wild on wooded river-banks from Western New-York to Illinois and southward, and is frequently found in cultivation, as its crimson fruit is very ornamental in autumn. The fruit is not edible, however, and, except in color, resembles a Strawberry about as much as a dry Pea-pod resembles a Baldwin Apple. Plants of this, as well as the still more ornamental species, *E. atropurpureus*, may be had at any good nursery establishment. They grow readily in any good garden soil, and are worthy of a place in every extensive shrubbery.

The Niagara Grape.—It will be agreeable news to all who have for the past half a dozen years watched the development of this remarkable white Grape, that the company which owns the stock has decided to place the vines on the market. *T. S. Hubbard, Fredonia, N. Y.*, has been appointed general agent, and will supply nursery-men and dealers at a fixed, uniform rate. The favorable opinion we had formed of this Grape when we first saw and tasted it has been confirmed with each succeeding year, and we are fully convinced that Grapes like those now received from Mr. Hubbard will more than satisfy by far the greater majority of people.

Meal-choppers.—We call the attention of our readers to the Enterprise Meal-choppers, advertised in our present issue. The demand for these choppers has attained such immense proportions, that the manufacturers have been compelled to largely increase their facilities for making them, and we are assured that they are now being turned out at the rate of 2500 per week, 150 hands being steadily employed on them.

There can be no doubt as to the excellence of these choppers, as they have been tested by the editors of nearly 100 agricultural papers, who have given them a hearty indorsement. We cordially recommend them to our subscribers as the best machine of the kind ever introduced to public favor.

Art Note.—Jean Robie is unquestionably one of the foremost living flower-painters. His pictures excel in their fidelity to nature, the warmth and richness of their coloring, and his subtle rendering of the spirit of the flower. His Roses are unrivaled. Like every artist of genius, Robie has been very unwilling to permit the publication of copies of his most cherished works. It is a matter for just congratulation to Americans that he has, at last, accorded this privilege to one of the most famous Art publishers. Mr. Louis Prang has undertaken to reproduce one of the artist's masterpieces as a satin print. The picture selected is of medium size, and includes Roses of various kinds, intermixed with Spirea, and arranged in a deep blue vase, which contrasts charmingly with a crystal bowl in the foreground, which reflects, as it seems, every ray of light. The copy is absolutely faithful to the original, and is the most ambitious publication of the kind ever attempted.

Michigan Farming.—The following extract from a correspondent of the *Cultivator and Country Gentleman*, referring to lands in Otsega Co., Mich., gives a fair idea of the productiveness of Michigan lands. Those desiring more complete information should write to Hon. O. M. Barnes, Lansing, Mich.: "Dr. N. L. Parmater, who has a homestead of 150 acres, four miles north-west of Gaylord, with 25 acres under cultivation, gives his average yield of corn at 60 bushels to the acre, and potatoes 250 bushels. Last year his oats grew 1 1/2 feet high, and weighed 40 pounds to the bushel. This year he has a field of timothy which must yield two tons or more to the acre, and a handsome field of winter-wheat, which ought to return 30 bushels to the acre. The doctor also has 200 standard and 80 dwarf apple-trees, the oldest set out two years ago, and all thrifty. They show an average growth of 18 inches last year, and about 12 inches to date this year. Last year he raised ruta-bagas at the rate of 300 bushels to the acre, sown broadcast, and a specimen Marbled cabbage, which weighed 20 pounds after the stem and loose leaves had been removed."

AMERICAN GARDEN PREMIUM LIST

A Desirable, Useful, and Valuable Present

To every subscriber to the AMERICAN GARDEN for 1885, and the remaining numbers for THIS YEAR FREE to those subscribing NOW.

ALL ARTICLES offered as Premiums are of guaranteed, first-rate Quality, including many wanted in every Home, and by every Person, Young or Old.  Read the Descriptions in the Premium List.

FINE PRESENTS FOR HOLIDAYS.

DELIVERED RIGHT no matter how far off you live! Many of the Good Articles **PREPAID** TO YOU, in the Premium List will be delivered, **CARRIAGE** to any place in the United States or Territories, however near or distant.

N. B.—The articles not offered post-paid, will be carefully packed without charge, and forwarded by express or otherwise, as may be desired, at expense of the receiver, or delivered free at our office. The expenses of carriage will not be great.

A DOLLAR AN HOUR can easily be secured by many persons, **LADIES** included (also by **BOYS** and **GIRLS**), thus: Show to friends and neighbors a specimen copy of the *American Garden*, its beauty and usefulness, and low cost. An hour's time should suffice to get 2, or 3, or 4 to take it. This will give you a dollar's worth, or **MORE**, of the valuable articles in the Premium List—articles better than their money cost. Why! it would *pay* many persons to continue this as a constant employment, and sell the premium articles received when not needed by themselves. **N. B.**—Any Premium club may contain subscribers from many Post-Offices.

ALSO NOTE, that in addition to your premium you can offer to every subscriber a **FREE** Premium, as noted on this page. (Several of these Seed and Plant parcels will be worth a full Dollar, or more, leaving the Journal free.)

A Present to Every Subscriber TO THE AMERICAN GARDEN.

While we offer a choice of many fine things to those who take time and trouble to aid the publishers in extending the circulation of THE AMERICAN GARDEN, as a recognition of their kind efforts and as a Reward or pay for such aid; and while we intend to and shall make THE AMERICAN GARDEN worth to every reader many times its small cost, yet we desire to give a friendly recognition of some direct kind to each one of our readers as far as possible; and having unusual facilities for securing valuable seeds, etc., desirable for use or for trial, we offer to every subscriber to THE AMERICAN GARDEN his or her own choice of any one of the Seed, Plant, or Bulb parcels named below.

 THIS OFFER IS TO EVERY SUBSCRIBER for one year, whether subscribing singly or in Premium or other Clubs.

 In sending your subscription or giving it to club gatherers, give in each case the number below of anything you desire.

 Our readers will notice that many of the things named are new and rare, and of extraordinary merit. To purchase these (if they could all be bought) would cost 25 to 50 cents each.

POSTAGE FREE. All the articles offered on this page as presents will be sent postage prepaid.

FLOWER SEEDS.

Directions for culture are given with each package.

No. 1. *Wild Garden Seeds.*—A half-ounce packet. This novelty in flower gardening, which was first introduced as an AMERICAN GARDEN premium, continues to be a general favorite; and being in greater demand than ever, we retain it among our premiums. The present selection contains over 100 varieties of choice flower seeds, which, in single packets, could not be bought under \$5.00.

No. 2. *Pansy, Bliss's Perfection.*—This strain eclipses anything hitherto offered, and for variety of markings, beauty of form, large size, good substance, and splendid satiny texture, is likely to remain unrivaled for a long time to come.

No. 3. *Single Dahlias.*—A packet of seeds carefully selected from over 100 varieties, comprising all the most brilliant and decided colors. If sown in early spring, in pots in the house or in the hot-bed, flowering plants may be had by mid-summer.

No. 4. *Hollyhock, choice double mixed.*—This plant has become very popular of late, and deservedly so, for its stately growth and varied colors commend it to a place in every collection. The seed offered has been saved from an unsurpassed European collection.

No. 5. *Balsam, "White Perfection."*—The immense pure white flowers of this variety are of the most perfect Camellia form, and for pot culture or cut flowers in winter is most desirable.

No. 6. *Everlasting Flowers.*—A mixed packet of 12 distinct varieties. This class of flowers is constantly increasing in favor, and for winter bouquets and decorations generally nothing is more treasured. All are annuals of easy culture.

No. 7. *Ornamental Grasses.*—A mixed packet of the 12 best varieties. As an accompaniment of flowers, fresh or dried, in bouquets or vases, nothing can be more appropriate and graceful than sprays of ornamental grasses.

VEGETABLE AND FARM SEEDS.

No. 8. *Pea, Bliss's Ever-bearing.*—A sample packet of this extraordinary new wrinkled Pea; for large yield, excellent quality, and continuity of bearing, it has no equal.

No. 9. *Pea, Bliss's Abundance.*—One packet. A new early dwarf variety, pods 3 to 3½ inches long, containing 6 to 8 large wrinkled Peas of excellent quality.

No. 10. *Chou de Beryhley.*—One packet. A remarkable new vegetable. It is hardy, and of a distinct, delicate, and delicious flavor.

No. 11. *Onion, Giant Zillan.*—One packet. An introduction from Europe, of handsome globular shape, bright yellow skin, and pleasing flavor. They grow to an enormous size.

No. 12. *Water-Melon, American Champion.*—One packet. No other variety combines so many valuable qualities.

No. 13. *Potato, Charles Oak.*—One tuber. Flesh snowy white, fine grain, well flavored, cooks dry and mealy. It is one of the most promising of the new varieties that have lately been brought into notice.

PLANTS AND BULBS.

No. 14. *Tritoma uvaria* (Red Hot Poker Plant).—A highly ornamental herbaceous plant, producing in summer and autumn dense flower spikes, averaging about two feet in length, and of a brilliant Orange-red color. The effect produced by these flame-colored flowers is admirable, and considering its easy culture, we consider this one of the best hardy plant premiums we offer.

No. 15. *Calla Ethiopica* (Lily of the Nile).—Every one knows this stately plant, so popular on account of its easy culture, and so desirable on account of its fragrance and free flavoring habit. We offer a strong root, which, with proper treatment will flower this season.

No. 16. *Clematis crispa.*—This is a beautiful and distinct species, recently introduced, the flowers of which are from one and one-half to two inches in diameter, and in form resembling a bell-shaped Lily; the color is best described as a beautiful lavender-blue, with a peculiar combination of opaque white, while the perfume is of a delicious piquant bergamot flavor.

No. 17. *Tigridia grandiflora alba* (new white Tigridia).—This splendid acquisition was the center of attraction wherever exhibited the past season. The flowers are pure white, and larger than the other varieties of this family.

No. 18. *Lily of the Valley.*—Six flowering crowns of this charming universal favorite, the pleasing and delicious odor of which no one ever tires of. It thrives well in shady places, and as a winter window-plant its deep green foliage and white flowers make it always welcome.

No. 19. *Clematis coccinea* (Scarlet Clematis).—One of the most desirable climbers for covering verandas, trellises, arbors, screens, etc., as it grows from eight to ten feet in one season. Its coral red flowers are produced in great profusion.

No. 20. *Valuable Seeds.*—Any one sending subscriptions to THE AMER. GARDEN at \$1.00 a year, can select, from the previous columns, one premium for himself or herself in addition to the one offered to the subscriber; or, in lieu thereof, send for the "Hand-book of the Farm and Garden" (to B. K. Bliss & Sons, 34 Barclay street, New-York), and select twenty-five cents' worth of any seeds therein named for each subscriber sent in.

No. 21.—Those sending 4, 5, or 6 subscribers may select 30 cents' worth of seeds for each.

No. 22.—Those sending 7, 8, or 9 subscribers may select 35 cents' worth of seeds for each.

No. 23.—Those sending 10, 11, or 12 subscribers may select 40 cents' worth of seeds for each.

No. 24.—Those sending 13, 14, or 15 subscribers may select 45 cents' worth of seeds for each.

No. 25.—Those sending 16 or more subscriptions may select 50 cents' worth of seeds for each.

PREMIUMS

To those securing and sending Subscribers to American Garden.

The publishers of the AMERICAN GARDEN offer a choice from any of the valuable articles described in the following pages, to all who will send the number of subscriptions named with each article. Everything described is first-class in every way, and CAN BE FULLY RELIED UPON. Great care has been exercised to offer none but the best and none but those possessing GREAT MERIT.

Almost any one can in a few hours gather names enough to get a valuable article that may be desired or needed WITHOUT EXPENSE.

No. 26.

A VERY GREAT CONVENIENCE

For every House, of Excellent Quality, and at only One-third of Former Cost!

A thousand times a year every Family finds it convenient to know the accurate weight of something—of articles to be sold and those bought (to "detect" cheating or "accident" in weight, so common among dealers, butchers, ice-men, etc.); to salt butter, make cake, put up fruit, etc., etc. Steelyards are very inconvenient; spring-balances are inaccurate for large weights, and are changeable; when good for pounds, they are quite too large for ounces. Good scales have been costly and cumbersome. NOW, in the "Little Detective Scales," we have great convenience, accuracy in weighing anything, from one-quarter of an ounce (for letters and papers and packages for mailing, etc.) up to twenty-five pounds. (Tens of thousands of dealers are now

using these on their counters.) They can be set on a shelf, be moved about, have both fine graduated brass scale arm and extra weights, from one to twenty-five pounds. Owing to their good quality, great durability, simplicity, and utility, the immense demand makes it possible to supply them at one-third the old price for such good scales. Value, \$3.00.

We will present the same with weights complete, packed safely to send anywhere, to any one sending 5 subscriptions to the AMERICAN GARDEN at \$1.00 each (or 2 of them for 9 subscribers).

No. 27.

LOUPE MAGNIFYING GLASSES.

A very convenient Pocket Magnifying Glass is shown in the engraving. It has two GOOD LENSES, 1 1/4 and 1 1/2 inches in diameter. These may be used singly or together, both closing into a strong, neat, polished Hard Rubber Oval Case, 1 1/2 by 2 inches and 5/8 inches thick. They magnify objects quite plainly, and may be used as a Sun-Glass to strike fire. PRESENTED, post-paid, for three subscriptions to the AMERICAN GARDEN at \$1.00 each. Two for 5 subscriptions. Value, \$1.15.

No. 28.

A GRAND OPPORTUNITY.

THE WORLD'S CYCLOPEDIA AND LIBRARY OF UNIVERSAL KNOWLEDGE. Will be forwarded FREE to any one sending us, BEFORE the first of December, two subscriptions to the AMERICAN GARDEN for 1885.

THE WORLD'S CYCLOPEDIA AND LIBRARY OF UNIVERSAL KNOWLEDGE

Is an elegantly bound volume of 800 pages, 50,000 separate and distinct references, 1200 engravings, illustrating various topics, accurate and concise information on art, science, philosophy, and religion, including learned essays by the compiler, Professor H. L. Williams, and several hundred other authors. The articles on Anatomy, Architecture, Agriculture, Astronomy and the Fine Arts are full and explicit. Botany, Chemistry, Engineering, Geography, Geology, and History are each treated ably and explicitly. The article on engineering is still further amplified by a full description, illustrated with plates and diagrams, of

THE GREAT BROOKLYN BRIDGE.

Mechanics, with plates illustrating mechanical motions; Mineralogy, Medicine, Law, Languages, and Governments are so clearly treated of that every one who reads can understand. In addition to the full and complete Cyclopaedia arranged in alphabetical form, we have bound up in the volume

A COMPLETE LIBRARY OF KNOWLEDGE,

including a Guide to Correct Speaking and Writing; Book-keeping, a Complete Guide to Business; Chronological History; Mythology;

AN INDEX TO THE HOLY BIBLE;

A Complete Brief Biographical Dictionary. Full and Complete Statistical History of the United States, corrected down to 1884. The Interest, Banking, Usury, Insolvent, and Homestead Laws of the United States are for the first time gathered together in one volume.

A LIST OF COUNTERFEIT NOTES,

with Rules for Detection of Counterfeits; Separate Dictionaries of Musical, Nautical, and Geographical terms. A carefully prepared treatise on Pronunciation, giving rules and examples whereby every one can become his own teacher.

AN APPENDIX OF THE ENGLISH DICTIONARY,

giving hundreds of words not contained in the ordinary dictionaries.

FLAGS OF ALL NATIONS,

beautifully illustrated by colored plates. In fact, the book is a complete library in itself. It is profusely illustrated, and contains a mine of information on almost every subject known to man. Every one of the many departments is worth more than the cost of the book. As "knowledge is power," this Cyclopaedia will be a source of wealth to thousands in all ages and conditions of life. This handsome octavo volume is printed on good paper and handsomely bound in cloth embellished with gold.

On receipt of two dollars for two subscriptions—not necessarily at the same Post Office—we will send the AMERICAN GARDEN from now till December, 1885, to the addresses given, and a copy of the World's Cyclopaedia and Library of Universal Knowledge to the sender of the club. Each subscriber is also entitled to one of our regular premiums, the same as if the subscriptions had been sent singly.

We make this extraordinary and liberal offer to compensate our friends for whatever exertions they may make toward extending the circulation of the AMERICAN GARDEN, and also to induce our readers to send in their subscriptions now, that we may be enabled to arrange our lists and books as much as possible before the close of the year.

No. 29.

AUTOMATIC LIGHTER,

FOR LIGHTING

LANTERNS, LAMPS, AND GAS,

Cheaper, Quicker, Easier, and Safer than Matches.

No irritating ends to be thrown down by careless persons, which the public know has caused fearful loss of life and valuable property.

THE AUTOMATIC LIGHTER

Is attached to lanterns, lamps, and gas-burners, and will instantly light the wick or gas sixty times in succession, without removing chimney or globe, lights equally well in the wind or in the shelter than a decided improvement over matches. We have given these lighters a trial and compare.

We offer either the Automatic Lighter for Gas Burner, the Automatic Lighter and Burner attached for Kerosene Lamp, or the Automatic Lighter and attachment for Burner for Kerosene Lantern, post-paid, for one subscriber.

The Automatic Lighter and Lantern complete for two subscriptions to the AMERICAN GARDEN at \$1.00 each, receiver to pay expressage. A box containing 200 lights accompanies each Lighter.

No. 30.

COMPOUND MICROSCOPE.

THE WONDERFUL UNSEEN WORLD
Brought to Your Eyes.

A most Remarkable Instrument, that every reader of the American Garden can now easily possess. Full of interest and of great Practical Utility.

The publishers of THE AMERICAN GARDEN are happy to announce that they have secured a most interesting and valuable Compound Microscope, that cannot fail to give great pleasure to every one that obtains it, and that they cannot only supply it at a very low price (not a quarter of the old price for so excellent an instrument), but multitudes can obtain one WITHOUT COST.

The engraving shows the instrument (in part) which is three times as large as this picture. It magnifies objects from 2500 to 10,000 TIMES their natural size, and even more if desired (50 to 120 diameters).

This instrument is of the most perfect make, and it has all the chief parts of compound microscopes, costing from \$50 to \$500, including solid STAND, Joint for inclinations, Stage, Clamps, swinging concave Mirror (for transparent and opaque objects), Draw tubes for greatly increasing magnifying power, two very fine Object Lenses, a very fine Eye-piece, very delicate Rack and Pinion for easily adjusting the focus, etc. The Body and Draw Tubes are fine nickel-plated. A very important adjunct is the

CAMERA LUCIDA,

which throws upon paper a highly magnified image of very small and even invisible objects, so that a child can make accurate drawings of them.

The whole instrument and parts are fitted into a very neat walnut Case, with handles—both for keeping and for carrying anywhere. Each instrument has several Accessories, such as glass cell for fluids, plain slides, glass covers for objects, and a mounted object.

It will afford wonderful interest to every possessor, and be useful in a thousand ways—in detecting the minutest adulterations in food, the infinitesimal insects that destroy plants, etc., etc.

Value, \$10.00. Every Instrument is guaranteed by the best makers in America (the Bausch & Lomb Optical Company). We will present this superb instrument complete, to any one sending us 15 subscriptions to the AMERICAN GARDEN at \$1.00 each, carriage prepaid.

No. 31.

A BEAUTIFUL GRAPHOSCOPE.

We offer to our friends a very beautiful Graphoscope, having a large, clear Lens, 4 inches in diameter, and Stereoscopic Lens combined with it, all arranged to be put away as desired, in the Case, which answers as the stand. The CASE is neat, polished, solid Walnut with imitation Ebony bottom and feet. This shows full-sized single pictures clearly, and well magnified, as well as stereoscopic views. The large lens can be held in the hand by its frame as an excellent "Reading Glass." Value, \$5.00. We will present it for 10 subscriptions to AMERICAN GARDEN at \$1.00 each.

No. 32.

VERY SERVICEABLE POCKET COMPASS.

We have secured a first-rate Pocket Compass, in a strong, polished Brass Case, very similar to a watch case, 1 1/2 inches in diameter. The Dial is white (bright Silver), easily seen at night. The large NEEDLE is very sensitive, taking its place quickly. It has a stop-bar, which is very important, as it holds the needle fast when not in use, and thus preserves it in order many years, no matter how rough the usage of the case. This excellent compass, valued at \$1.50, will be PRESENTED, post-paid, for 3 subscribers to the AMERICAN GARDEN at \$1.00 each (or two compasses for 5 subscriptions).

No. 33.

THE ELECTRO RADIANT.

The most Popular Magic Lantern ever introduced

The body of the ELECTRO RADIANT is a conical-shaped reflector which gathers each divergent ray of light and concentrates them all on the main reflector, whence the whole mass of brilliancy illuminates and projects the picture with startling clearness. No combination of lenses, however ingenious, has ever been known to produce equal effects with the light used.

The Lantern is made entirely of metal. Including the smoke-stack, it stands over 16 inches high when ready for use, but when taken apart it goes into a box 11 x 9 x 12, small enough to carry in the hand. There are 12 slides with 2 1/2-inch pictures packed with each Lantern.

For Parlor Entertainments hardly enough can be said in praise of the ELECTRO RADIANT MAGIC LANTERNS. They are now so constructed that youth of either

sex can readily operate them, and amuse, time and time again, the young and old friends, too. Children gaze with sometimes silent and sometimes very loud wonder at the pictures on the screen, and if parents or friends wish to be held forever in remembrance, a present of a Magic Lantern will do the business. Parlor exhibitions are not alone for the young.

Grandpa and grandma, papa, mamma, uncles, aunts, cousins, the minister, the doctor, the visiting friend, and neighbors far and near enjoy it just as much as the youngsters. Through our improvements thousands of homes may now be supplied with a Lantern outfit at a moderate outlay, and joy be given not for a year only, but for a life-time.

In Institutions for the instruction of those thousands among us who are bereft of one or more faculties what more direct way of appealing to the remaining—often acutely sharpened—senses is there than through the medium of an illuminated, magnified picture on the screen in a darkened room?

For Earning Money by giving Public Entertainments the possessor of an ELECTRO RADIANT has something that will "draw" with the combined power of the Theater, the Circus, the Prestidigitator, the County Fair, the Temperance Crusade, and the Camp-Meeting. A room that will hold 100 persons may be filled nightly and a good profit be cleared. Our photograph slides represent faithfully Beautiful Works of Art, Scriptural Scenes, Portraits of Prominent Persons, and Comic Subjects that are a never-ending source of delight.

A comparatively small amount of money will set a person up with an exhibition outfit which will make better returns than the same amount invested in any other business we know of. A small outfit may even be carried in the hands, and the preparation for an exhibition can be made in a few minutes. There are no heavy expenses for transportation, corps of assistants, intricate stage accessories, and illumination. Only a screen and the apparatus to transport and set up, and you are ready for business. If you succeed in getting only a small audience together it will pay, because the expenses are so small. And you can have almost any subject illustrated, and that one set of slides will carry you as long as you like. Value, \$12.00. The same will be furnished to any one sending 20 subscribers to the AMERICAN GARDEN at \$1.00 each.

No. 34.
Purdy's Perfect Pen
"Ever Ready."

Just See those People Write—An Amusing Scene — "Dips."

Did you ever carefully watch a number of people writing together in the same room? If not, do so, and you will find it very amusing indeed. No two will act alike. One sits bolt upright; others bend their heads forward, right, left, over way. One sits still; others constantly move necks, shoulders, heads,—one making a direct bow to every long letter, and others a quartering one. Every second or third person has a particular position of the tongue in his cheek, teeth, or mouth,—in short, there is a distinct "mannerism" in every writer, aside from the letters he makes on paper, that would enable you to name each of a large party of writers if standing behind them. Try the experiment. But they all agree in one thing,—they keep up an everlasting "dip," "dip," "dip"—in the inkstand. And in this they differ greatly. One does it deftly; another makes an "inky way" between bottle and paper, often on to it, saying nothing of blots, soiled fingers, etc.

CURIOS FIGURES.—Ordinary writers take a "dip" about every 40 seconds, depending upon the kind of ink, pen, etc., and this "dipping" means a great deal. As the previous "dip" runs out the letters grow faint, and the next ones are over-inked. On the average it takes at least one-fourth of all the time to go for ink and get the pen back and properly join on the words or letters where you left off to "dip." This is a serious loss of time and a bad interruption to a man writing figures, and especially to one putting down a train of thought. A dozen persons, writing steadily and rapidly for a single hour, will take about a thousand "dips." A clerk or business man writing a dozen years has spent one to three years in taking "dips"! (Not "tips," mark you.)

All the above easily saved, and other disadvantages. We write this with a first-rate Gold Pen that has not taken a single "dip" in four days, though it has written over thirty pages of letters! When it stops, we can in one minute give it a new supply of ink that will last as much longer. It is "PURDY'S PERFECT POCKET PEN." It is always with us, ready on the instant, at home or abroad, in the business office, in the study or library, in the cars, in the hotel room, EVERYWHERE! No inkstand needed. It is used in place of lead pencil, always ready pointed, and an indelible one, too. It pays for itself every month in the year! In every house it will save table covers and carpets enough to pay for itself. It is very durable and, allowing a round interest on its price and a good "sinking fund" on the purchase money, it does not cost a cent a week! You, and your Wife and your Children, and your "cousins and sisters and aunts" and uncles too, want it. Its Gold Pen is the best. Its holder is neat, hard rubber.

This neat and durable Pen, valued at \$4.00, will be presented, post-paid, to any one sending 8 subscribers to the AMERICAN GARDEN at \$1.00 each, which can be quickly gathered among your friends and neighbors.

N. B.—In sending for the pen, say whether you want a *stiff* or *limber* or *medium* one. If the first does not suit your hand, you can exchange it for another at the cost of postage each way.

Every Man, most Ladies, and even every Boy, need a Good Watch that can be depended upon.

Very few can afford trustworthy Gold or Silver watches at the high prices they have hitherto cost.

There are now some very good watches made at reasonable prices, which are pretty reliable if you can get the right ones; but,

Not one in ten of those which are claimed to be of this kind are really trustworthy. There is more deception and swindling in watches than in almost anything else.

Nine-tenths of all the troubles with good watches come from dust that gets into the delicate wheelwork during the opening for winding and through the key-hole. The inside of every key collects more or less dust, which, though invisible to the eye, is large enough to injure the works, into which it slips in winding. It is hardly possible to wind a watch a year (365 times) without the works being more or less soiled. Therefore, the Stem Winders and Setters are of great importance, as with these a watch need seldom be opened, but will go on for many years, without cleaning. The saving in this will pay the interest on even a very costly watch.

No. 35.

How to Get A Good, Cheap, Reliable Watch.

The publishers of THE AMERICAN GARDEN are happy to announce to their friends that they have succeeded in securing a most Valuable Watch, which they can recommend with the greatest confidence, and which they can supply at a very low rate; also, that they can put it in the power of several thousands of people to obtain this most valuable Watch WITHOUT COST.

Description.—The engraving (Fig. 35) shows the size and general appearance of the Watch, which is very tasteful. The Case is pure coin silver, solid and substantial; the Face is clear white, easily seen by day or night, and is covered with a thick, flat, bevel-edged, clear Crystal, so strong as to endure heavy pressure. It is a Stem Winder and Stem Setter. (See importance of this above.) The Works are of very superior excellence, every way equal to many Gold Watches sold for \$100 to \$150. The balance runs in Jewels. It has an expansion balance (to counteract heat and cold), and Nickel Movements; in short, it is so substantially made as to wear a life-time, and is abundantly accurate for all ordinary purposes of Business men, Professional men etc., etc. The Works are specially made for us, at one of the best Establishments in Switzerland, where long practice, cheap labor, and the most improved machinery enable them to supply such watches at a very low rate, and our special arrangements secure them to us at very near the cost of making.

This Watch, valued at \$15.00, we will present, post-paid, to any one sending us 25 subscribers to the AMERICAN GARDEN at \$1.00 each.

No. 36.

SAME WATCH IN HUNTING CASE.

Same Watch as No. 35 every way, but with the solid silver cap, or "Hunting Case" (as shown in figure 36), will be presented, post-paid, to any one sending 27 subscribers to the AMERICAN GARDEN at \$1.00 each. Value, \$16.00.

The Works ("the movements") of a Watch are the important part, and, if these are right, it will keep just as good time and last as long, whether in a nickel case or in a silver or gold one. A Silver case is just as good as a Gold one, and will last quite as long.

No. 37.

A WATCH CHAIN

is as indispensable as a watch itself; in fact, most people would as soon be without a watch as to wear it without a chain.

A Solid Gold Chain is an expensive affair which cannot be indulged in by every one. The chain here offered as a premium—and which by a little effort may be secured without cost—is Heavy Rolled Gold Plate, and cannot be distinguished from solid gold.

It is of most elegant and fashionable pattern, and of the best possible workmanship. With reasonable care, such a chain will last and look like new for a great many years. Even those who possess a solid gold chain will, when traveling or on other occasions when articles of much value are apt to be lost or stolen, find such a one a convenient substitute.

This chain, valued at \$3.50, will be presented, post-paid, to any one sending 6 subscribers to the AMERICAN GARDEN at \$1.00 each.

No. 38.

SLEEVE BUTTONS.

Like the above, these are not of the so-called Cheap Jewelry style, but are so well made and so heavily gold plated that no one can see the difference between them and solid gold ones at many times their cost. They have the Patent Acme Lever Fastening, and can therefore be put on with ease, and will stay after being put on. The center consists of a genuine Tree Agate, and they are, all in all, of us choice and tasteful appearance as any in market. For a Philopona, Birthday or Christmas Present for a lady or gentleman, nothing can be more appropriate. Value, \$1.25.

We will present a pair of these sleeve buttons to any one sending 2 subscribers to the AMERICAN GARDEN at \$1.00 each, post-paid.

No. 39.
BEACH'S NEW IMPROVED AMERICAN
COMBINATION FRET SAW.

The many advantages of the above implement can be seen at a glance. It is chiefly built of iron and steel; has tilting-saw table; saw swings twenty inches for large brackets, and swings straight up and down; blower for dust. It will cut Horn, Bone, Ivory, Pearl Shell, Brass, and all kinds of wood up to one and one-half inches thick. It has Drill Attachment always ready for use; also Turning Lathe for wood twelve inches long and four inches diameter, and can be speeded to 1500 revolutions per minute. Has set of best steel Turning Chisels, Morse's Flint Drill, Oil Can, Screw Driver, a three-sixteenths-inch wide SAW for cutting up timber, etc., and 6 improved FRET SAWS. Value, \$8.00. We will PRESENT it for 16 subscriptions to AMERICAN GARDEN at \$1.00 each.

No. 40.
JUST HOW TO MAKE THEM.

EVERY LADY in America, young and old, and all the GIRLS, too, will be greatly delighted with a New Book, costing but a trifle, yet giving 400 beautiful Illustrations and Patterns of Fancy and Needle Work, in wonderful variety, with plain directions how to make at home. It is even worth many times its cost to keep to look at. The eminent writer, JENNY JUNE, says of this Book:

"It supplies within its compass a greater variety of excellent designs, every one of which is useful for dress or household decoration, than have ever before been gathered within the leaves of one Manual."

This is not too high praise. It is a Reliable Book for Daily Reference, enabling one to do artistic Embroidery, Lace Work, Knitting, Tatting, Crocheting, Macramé Lace Work, Net Work,—indeed, all kinds of Fancy Needle Work. This Valuable Book is beautifully printed on fine tinted paper, with handsome cover. It is entitled "The Ladies' Manual of Fancy Work." But this does not fully express its real, practical, and general value.

We will present, post-paid, a copy in return for 2 subscriptions to the AMERICAN GARDEN at \$1.00 each; and will send an extra copy for every additional new subscriber. Value, 50c.

No. 41.
EVERYBODY NEEDS
THIS

AMERICAN DICTIONARY and CYCLOPEDIA.

No matter how many other Dictionaries they may have, large or small. This book is a neatly bound volume of over 600 pages (3 columns a page), giving the accurate Spelling, Pronunciation, and Definitions of

OVER 50,000 WORDS,

and 41 pages containing a great number of small engravings illustrating the words. The book is worth far more than it costs for these alone; but it contains in condensed form a VAST AMOUNT OF OTHER

VALUABLE INFORMATION

that everybody wants for constant reference. It is in this respect a comprehensive *Baeyelopedia*, embracing 84 interesting subjects, too numerous to describe here. Among these are 24 pages of Vulgar and Incorrect Words and Expressions corrected; 30 pages of Difficult Words; 24 pages containing all names in the Scriptures and Apocrypha rightly pronounced; 340 business words and terms explained, such as "Drafts," "Days of Grace," "Checks," etc., etc.; 400 words and terms used on Ships; 24 pages teaching how to Write and Speak properly and easily; Metrical System explained fully; Tables for readily reckoning Interest; Census population of States, etc., including 250 Large Cities and Towns; 53 past years' Prices for Wheat, Flour, Corn, Cotton, Sugar, Coffee, Beef, Butter, Iron, etc.; 500 common names of Men and Women, their derivation and meaning; Mortality Rate, and how long a person may on the average expect to live beyond any age; Wages Tables, etc., etc.,—to 84 subjects.

We will mail the above comprehensive and most valuable work, post-paid, for 2 subscriptions to the AMERICAN GARDEN at \$1.00 each. Value, \$1.00.

No. 42.
FOR PLANTS, CLOTHES, ETC.

If you have plants you can hardly do without the Elastic Plant Sprinkler, and for sprinkling bouquets, dampening clothes, etc., it is very convenient indeed. It is of elastic India Rubber, with a flat bottom to stand on, and a Rose which sends forth a fine spray on simply pressing the sides. It sucks in the liquid through the Rose, thus clearing it of coarse impurities. It is very durable. Everybody wants this. Value, \$1.50. We will PRESENT one, post-paid, for 3 subscribers to the AMERICAN GARDEN at \$1.00 each, or 2 Sprinklers for 5 subscribers.

No. 43.
THOSE TROUBLESOME SKATES NO MORE!

EVERY BOY, almost every Man, especially a heavy one, knows the trouble of keeping Skate Straps tight enough, without stepping free circulation of the blood in the feet to keep them warm. The heel would slip off in spite of you, even when you carried round a heavy metal plate fixed on its bottom. All such troubles are avoided in the N. Y. Club Skate. You clap it on the sole, turn the double-working screw, and the front is fast. With the same key turn another screw behind, and three flanged Clamps firmly grasp the boot heel in its front and on both sides of the rear. The whole is done in a moment, and away you go,—with the skates immovably fixed on the soles, and the feet warm by the freely circulating blood. These fine Skates have excellent Steel Runners and strong Frames. Send five subscribers to the AMERICAN GARDEN at \$1 each (it is worth \$10 a year to anybody), and we will PRESENT you with a Pair of these Splendid Skates and deliver them carriage paid. For nine subscribers we will give you two pairs.

N. B.—Send a paper, out just the size of your boot sole, and we will select the right size skates.

GRATEFUL-COMFORTING.
EPPS'S COCOA
BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of selected Cocoa, Mr. Epps has prepared our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle miasmas are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."
 Made simply with boiling water or milk. Sold only in half-pound tins by Grocers, labeled thus:
JAMES EPPS & CO., Homeopathic Chemists, London, England.

NEW EARLY RHUBARB—"PARAGON."

This variety, although now offered for the first time in this country, has had extensive trial in England, and has more than verified the claims made for it. It is unquestionably one of the finest varieties of Rhubarb ever offered, being the earliest of all and wonderfully prolific. The crowns and stalks are produced in such profusion that more than twice the weight can be gathered from "PARAGON" than from any other sort. It has also the qualification over all others that it NEVER SEEDS, a claim that we have tested and found well sustained last summer. The leaves are remarkably small, white in color the stalks are a beautiful bright red, and in flavor unsurpassed. Price, strong plants, 50 cents each, by mail, post-paid; six for \$2.50, postage 25 cents extra; twelve, \$4.00, postage, 50 cents extra.

THE KEYSTONE WASHER. OVER 300,000 IN ACTUAL USE And all giving perfect satisfaction. **AGENTS WANTED.**

The American Garden

A Monthly Journal of Practical Gardening.

Dr. F. M. HEXAMER, Editor.

B. K. BLISS & SONS, Publishers.

Vol. V.

NEW-YORK, NOVEMBER, 1884.

No. 11.

A FRIENDLY REQUEST.

Our offer of last month, to send the remaining numbers for this year free to all subscribing now for 1885, has been promptly accepted by many of our older subscribers. In many cases the free copies were directed to be sent to friends at a distance, a number of whom had never seen THE AMERICAN GARDEN before, and were so much pleased with it that they became subscribers at once.

It is in this connection that we wish to remind our friends of the great service they can do us by bringing our paper to the notice of their friends interested in gardening matters of any kind, be it in city or country. We will gladly forward sample copies to any one whose address is sent us.

This surely is not much trouble, and a postal card costs but a cent; yet the aggregate results would add so large a number to our subscription list that it would enable us to considerably improve our paper and enhance its usefulness, thus benefiting our readers as well as ourselves. A favorable mention to a friend will have more influence than a whole column of our own advertising could have.

A HORTICULTURAL LIBRARY FREE.

The amateur horticulturist, as well as the experienced professional gardener, will at times require a work for ready reference, but on examining available books they will find that many volumes and a considerable amount of money would be needed to furnish all the desired information.

A set of the yearly volumes of THE AMERICAN GARDEN contains more reliable practical information about the cultivation of Flowers, Fruits, Vegetables, and any and every branch of Gardening than many a whole library. Each volume is carefully indexed, so that any subject may be found in a moment. The volumes for 1882 and 1883 we have constantly on hand, and the present year's will be ready in December.

For One Dollar either of these will be mailed to any post-office in the United States. To those who wish to obtain them free, we make the following liberal offer:

To any one sending us Ten Dollars for ten subscribers to THE AMERICAN GARDEN for 1885 we will send, free of all charges, the set of three volumes.

To any one sending us Four Dollars for four subscribers to THE AMERICAN GARDEN for 1885 we will send, free of all charges, either one of the three volumes he may choose.

Each member of such a club will receive

RENEW NOW! SUBSCRIBE NOW!

Remember that every person sending a renewal of, or a new subscription to, THE AMERICAN GARDEN for 1885, NOW, is entitled to the remaining numbers for 1884, free of expense, also to any one of the premiums offered to single subscribers. Those who are already subscribers for 1884 may have the remaining numbers of this year sent to any address they may designate, free of expense.

ABOUT BOOKS.

Failure may be guaranteed to any one embarking in a new enterprise who neither avails himself of the experience of others, nor takes pains to inform himself by reading on the subject. Judicious persons will make use of both of these means of information.

Books were formerly the principal, if not the only, source of information through reading, but the periodical publications of the present day have, to a considerable extent, superseded books. Specialists who in former years would have written books are now—if they wish to reach the greatest number of readers—devoting their time and work to magazines. The perfect journal does not give the ideas and views of one brain only, but it draws together within its pages and disseminates the best thought, the most reliable teachings, and the results of the experiences and experiments of all the best workers in its special field everywhere.

Such a paper, in the horticultural world, is THE AMERICAN GARDEN. However complete a library

you may have, and how many papers come to your table, if you are at all interested in gardening or any branch of it, you cannot do without it.

FRIENDLY WORDS.

Of all the agricultural papers I have ever seen, I prize THE AMERICAN GARDEN most highly.—R. S., Akron, O.

I am well pleased with your excellent monthly. It looks well, reads well, and best of all, is full of practical knowledge.—Mrs. M. J. P., Lynn, Mass.

FALLING LEAVES.

THE wind its trump hath blown
Adown the dell:
And, lo! what leaves are strown
On yon grey stone
And o'er the well!

Like human hopes they fall—
Hopes born in spring,
When Nature's cuckoo-call
Wakes life in all
And everything!

Leaves matron Summer nurs't
On sunny slopes,
Where their young verdure first
To beauty burst—
Leafage and hopes.

But the autumnal gust,
That sweeps life's dell,
Blows leaves as red as rust
Into the dust,
And Death's dark well.
ISABELLA BANKS.

the remaining numbers of this year free, and will also be entitled to one of the premiums named on page 221, the same as if the subscription had been forwarded singly.

INDEX FOR 1884.

WITH our next number will be sent, free, to all old and new subscribers, a complete alphabetical index for the current volume, in addition to our regular number of pages.

Copyright, 1884, by B. K. BLISS & SONS.

The Vegetable Garden.

SEASONABLE HINTS.

Celery.—If banked up too early, becomes very liable to rust and rot; and, except what is wanted for early use, need not be banked up at all; it will bleach during its winter storage. Thick wrapping paper tied around the stalks has been found to answer the purpose satisfactorily.

Wintering Celery.—The digging of trenches as deep as the Celery is high, and eight or ten inches wide, placing the plants with their roots and the adhering soil upright and close together in these, giving sufficient protection against freezing as the weather grows colder, is still the usual way of preserving this delicious vegetable.

Last winter we tried the experiment of leaving the plants in the ground where they grew, without taking them up at all, and the result proved so satisfactory that we shall leave all of our crop outdoors the coming winter. About the middle of November the plants received their final banking up, so as to cover all but the tips of their leaves. Early in December about six inches of additional soil was thrown on the top of the ridge, and all well patted down with the back of the spade. Leaves raked from the lawn and old corn-stalks were placed on the ridge a few inches thick, and on the top of this some branches of an old unsightly Norway Spruce which had just been cut down. The soil froze a few inches, but there was never any difficulty in digging the Celery, which remained as sound and fresh as could be and improved constantly in quality. About every two weeks we dug a good-sized soap-box full, which was placed in the house-cellar for the family supply. The last digging was about "Pea-planting time," and we are sure it was not less delicious than the first.

Keeping Squashes.—The best keeping variety is undoubtedly the Hubbard, but last winter we kept Perfect Gem in good condition till the end of January, when the supply gave out. The principal condition for keeping Squash is to gather them before they are injured by frost. It is thankless work to try to keep them after being frosted. It is also important that they should be handled carefully, so as not to bruise or chafe the skin. They should be placed in single layers on shelves in a perfectly dry place, where the temperature does never fall below 40°. A cellar best suited for keeping Apples or common Potatoes is too warm for Squashes.

Sweet Potatoes require about the same temperature as Squashes. They should be carefully handled, placed in barrels or boxes, and covered with sand or dry soil.

Water-cress is constantly growing more in favor as a winter relish. Cuttings may be made at any time this month, and planted about four inches apart on a greenhouse bench. The terminal shoots three to four inches in length are best for this purpose. They require rich soil, full sunlight, and plenty of fresh air on all mild days, else they are liable to "damp off." Three or four crops may be taken off during the winter months.

POTATOES FOR SEED.

There exists quite a diversity of opinion among Potato growers as to the portion of Potato to plant. It is a custom with many to cut off and reject the seed-end, and the results of trials, oftentimes conflicting, are quite often given to the public as proving one theory or another. When these experiments, however, are carefully studied, it becomes evident that the terms of the problem do not admit of exact representation in figures, but should rather be expressed in terms of greater or less.

With the view to determine whether one portion of the Potato is more valuable for seed than another, last year Dr. Sturtevant, director of the New-York Experiment Station, laid out a plot to be planted with single eyes, in order, as cut from the Potato. The Potatoes used, the White Star variety, furnished from 9 to 27 eyes apiece, and 30 Potatoes furnished the eyes requisite for planting 1-20 of an acre in drills 3 1/2 feet apart, each seed being placed at one foot distance in the drill. At harvest time, each Potato was gathered in three portions to be designated as the stem third, the central third and the seed-end third.

The total number of eyes planted was 582, and of these 16 from the stem-end, 5 from the center, and 4 from the seed-end failed to grow.

The total crop was 388.77 pounds of good Potatoes, 86.23 pounds of small Potatoes, and 192.62 pounds which were rotten. By multiplying by 20 the yield per acre will be obtained. In order to get figures which can be readily compared, the yield was calculated per 100 eyes, or 100 hills, and this may be represented by the following tables:

	NO. OF POTATOES PER 100 HILLS, FROM			
	Good.	Small.	Rotten.	Total.
Butt eyes.....	195	290	122	607
Center eyes.....	234	269	176	679
Seed-end eyes.....	229	256	147	632

	YIELD IN POUNDS, PER 100 EYES PLANTED.			
	Good.	Small.	Rotten.	Total.
	Lbs.	Lbs.	Lbs.	Lbs.
Butt eyes.....	62.18	15.48	26.81	104.47
Center eyes.....	72.88	15.23	43.05	131.16
Seed-end eyes.....	73.73	15.72	33.41	142.86

The four eyes from the extreme seed-end of these same Potatoes, calculated in like manner, yielded, per 100 eyes, 213 good, 272 small, 150 rotten—total, 635 Potatoes; and the weights were 32.55 pounds of good, 20.33 pounds of small, and 40.32 pounds of rotten—total 143.20 pounds.

The lesson taught from these tables is that there is certainly no inferiority of the seed-end when used for seed. On the contrary the figures not only absolutely, but relatively, show a distinct advantage for the seed-end eyes in weight and crop, while the figures do not show the same advantage in the number of good Potatoes. That this relation is not an accidental one is made clear by the calculation of the yield of the four extreme eyes from the seed-end which give figures yet more favorable.

Indeed, the general summary of his experience with the Potato as heretofore represented, as well as the result of the present experiment, goes to show that the vitality of eyes used as seed improves according to

the position they occupy upon the Potato toward the terminal position.

During the season of growth the plants from the central eyes showed slightly more vigor of growth than did these plants from the ends of the Potato. This fact was, however, so little marked, that it could only be observed by taking a comprehensive glance over the plot, which showed a slight undulation from the, in general, greater size of the central plants of the Potato.

Perhaps the influence of the position of the eye upon the Potato is best illustrated by the total yield from the 100 hills, which, as we have seen, is 104 pounds for the butts, 131 pounds for the centers, and 142 pounds for the seed-end eyes. Allowing 60 pounds to the bushel, and expressing our results in bushels, allowing each hill to have grown, we have, for the total yield, 206 bushels for the butt eyes, 259 bushels for the center eyes, and 282 bushels per acre for the seed-end eyes; or, for the yields of good Potatoes from the several kinds of eye, 123 bushels, 114 bushels, and 146 bushels of merchantable crop.

While one experiment hardly affords sufficient data for generalization, says the Doctor, yet an experiment as carefully conducted as this one, and with the method of planting, should possess some value as indicating the influence of position upon the seed eyes used. Yet we must remember, however, that if we had used more or less of the eyes in our trial the result would not have figured, in all probability, relatively the same. We can, however, truthfully express the fact that in this experiment we have gained increase of crop from the eyes taken from the seed-end portion of the Potato, and we may be justified in coming to the general conclusion that until further evidence is obtained the seed-ends, hitherto rejected by many, may be considered of equal value with that portion of the Potato usually selected for planting.

The summary for the Potato experiments made this year at the Station furnished scarcely any positive conclusions. There are, however, a number of inferences which can be drawn with quite an assurance of certainty, and which the Directors sum up as follows:

Single eyes used as seed yielded satisfactory crop per hill, and more uniform crop per hill than whole Potatoes or ordinary cuts.

Single eyes yielded a smaller percentage of small Potatoes than did ordinary cuts or whole Potatoes used as seed.

Ordinary cuts, upon the whole, yielded more favorable results than whole Potatoes, markedly so when the seed used is subtracted from the crop gained.

Single eyes cut deeply, so as to contain some substance, gave far superior yield to eyes cut shallow.

The small seed-end eyes gave results by no means inferior, but rather superior, to those gained from central and butt-end larger eyes.

Early planting showed far more favorably in crop than later planting, not alone in quality, but in total yield.

Too close planting diminished the yield of good Potatoes, and increased the yield of small Potatoes, by measure.

Fertilizer left over from last year's application exercised a marked influence upon the crop.

TOMATOES IN WINTER.

It seems strange that those who have greenhouses do not oftener grow Tomatoes during winter, as their management is quite easy, and a few pots properly cared for will give a constant supply all winter.

For this purpose it is best to raise the plants in pots, from cuttings made before frost has killed the outdoor vines. The young plants have to be repotted frequently, and finally in ten to fifteen inch pots. They should be trained to stakes or some form of trellis, as shown in our illustrations. The lateral shoots should be well pinched in to prevent the formation of too much foliage, and plenty of sun is necessary to their healthy development.

They may also be trained to the rafters of the greenhouse, and in a light, sunny plant room, where the other plants would not suffer by the shade, a Tomato vine might be trained around a window, and, if kept pruned properly, present a not unattractive appearance.

ROOT CULTURE.

When harvesting roots it is frequently observed that, while seemingly the best care has been given to the crop, it is not all that might be expected. A chief cause of this is that in the average farm-garden all seeds are put into the ground at about the same time. Very little thought is given to the difference in lengths of time needed for maturing the different varieties. The main idea seems to be to get the ground prepared and planted in one job, so that it will not call for another application in that line.

I have noticed this particularly with regard to the different root-crops. Onions, Parsnips, Beets, Mangel-wurzels, Carrots, Radishes, Turnips, etc., etc., are assigned their little spaces, and disposed of at one fell swoop, and the garden is laid aside, with, no doubt, a sense of duty well performed.

Now the largest share of these roots are intended for use during winter and spring, and if sown as early as the summer garden vegetables should be sown, they will mature in late summer or early autumn. Before cold weather sets in they will become shriveled up and tough, when they should be crisp and tender.

The fore part of June is early enough for sowing Beets, Carrots, Renta-bagas, and similar roots that are intended for winter use, while winter Radishes and common Turnips may be sown two months later.

By the first of June the ground is usually in better condition, and can be made deeper and mellow than is possible where it is planted early in the spring. At this time the earth has usually become thoroughly warmed through, and there is much more certainty of the seed germinating than if put into the ground when it is cold and wet. The rush of work will be over, and the better attention can be given to this part of the gardening.

In preparing the ground for the seed, thus late in the spring, the first start of young weeds is killed out, and the young plants coming up quickly under the favorable conditions, stand a fair chance with them for an existence. Not so with those that have been sown early; they were a long time in getting up through the ground, and grow slowly for weeks afterward. The disadvantages under which the plants have labored do not

seem to have retarded the weeds in the least, for the whole ground is matted over with them, and by the time the plants are well above ground, a search for them must be commenced although the rows cannot be distinguished except by a practiced eye and by the aid of imaginary lines.

HOOP TRELLIS.

Without any exaggeration, it requires double the labor to cultivate those sown early as it does those that are sown the fore part of June. We can endure this where it is necessary in order to procure early vegetables, but in raising roots for winter use, it is worse than useless.

Where roots are raised in considerable quantity, I would certainly have the rows as far apart as twenty inches, so that horse-power could be used for cultivating. The cultivator used should have small teeth that will not throw much soil, and then it can be run close up to the rows, and loosen all the

FLAT TRELLIS.

surface of the ground thoroughly. This will save an immense amount of hand-work in weeding along the rows.

In thinning out, there is usually more hand-pulling done than is at all necessary. The hoe can be used in this work by cutting out spaces the full width of the blade, thus

leaving the remaining plants in clumps which are much more quickly thinned out by the help so given. Carrots will do very well if these clumps are allowed to remain, as the plants have a chance to crowd out on every side. There are few roots that will stand as much crowding as the Carrot.

W. D. BOYNTON.

APPLYING MANURE IN THE FALL.

After winter grain is sown in the fall there is generally some spare time on the farm that can be profitably employed in carting and scattering all the manure available. My plan of hauling out manure is to plow the ground first, then scatter the manure on top and then harrow well. The natural course of manure is downward, and if it is applied upon the level ground and then turned under in the fall the best part of the fertilizing substances is buried too deep to be of any special benefit to growing crops.

While I do not advocate the use of fresh manure, especially in the garden or truck farm, preferring generally to pile it up and work over until well rotted; yet in the fall, if there is plenty of time and the soil has been plowed, I would haul out all the manure on the place, whether it was rotted or fresh.

I have never found it a profitable plan to put manure in piles and scatter afterward. A man can scatter better and more evenly from the wagon than he can on the ground, and he can spread a load almost as fast as he can unload in piles. Manure to be of the greatest benefit should not be too lumpy or scattered in heaps, but should be spread as evenly as possible so that one or two harrows will work it well into the surface.

The advantage of fall manuring is that the soluble parts of the manure will soak into the soil and be available for the feeding roots of the crops planted in the spring. One of the principal causes of the failure of the first crop planted on land that has been well manured is that the fertilizer is not applied so as to render it available as plant-food. This is especially the case where fresh or coarse manure is applied in the spring.

N. J. SHEPHERD.

MORE ABOUT EARLY PEAS.

Commenting on "Elm's" "Talk upon Peas," in our last issue, B. F. O., of New Jersey, says: "I think sprouting Peas for early planting is a mistake; it has a tendency to weaken the seed. Peas can be planted out-of-doors as soon as the ground is thawed deep enough to get in the seed. I have planted Early Kent in March, and had Peas May 26th. When four inches high, they were snowed under. This year I planted Kentish invicta April 9th, and had first Peas June 13, and when the vines were done bearing they sprouted again near the ground, producing a second crop of larger and sweeter Peas."

[Differences of soil should be taken in consideration in this regard. While in a naturally dry and warm soil "planting as soon as the ground is thawed deep enough to get in the seed" may prove perfectly successful, in a heavy, cold soil seed thus deposited would in most seasons rot, or at best produce poor, sickly plants. This we know from oft-repeated experiments.—ED.]

The Fruit Garden.

SEASONABLE HINTS.

Do not cover your Strawberries too early, is an injunction which we cannot too strongly impress upon our readers at this season. The novice in fruit culture is always in great haste to protect his plants so soon as the first snow-flakes fall or frost kills tender vegetation.

The object of winter-mulching being to prevent the ground from too frequent thawing, it is evident that any process that guards it against freezing does more harm than good. Of course, it is possible to mulch plants so heavily as to keep the ground from freezing at all, but not without smothering or seriously injuring them, unless they were in a cold frame.

In this latitude it is not advisable to cover Strawberry plants much before the last week of this month, and never before the ground is frozen hard. Freshly cut evergreen branches, the concave side placed downward, make the very best and most conveniently applied covering material, and may be turned to the additional use of serving as Pea-brush the following summer, for which the straighter branches are excellently adapted. On farms or country places, where some out-of-the-way land is available, it would be worth while to plant a number of Norway Spruce or other quick-growing evergreens for this purpose alone. In the absence of evergreen branches, straw, leaves, or corn-stalks may be used. A covering of two or three inches at the utmost is sufficient.

Root Cuttings.—Blackberries, and all varieties of Raspberries that sucker freely, may be propagated by root cuttings; and when it is desired to increase a new or scarce kind as rapidly as possible, this is the plan pursued.

At any time after the plants have ceased growing, and before the ground freezes to a great depth, the roots are dug up and cut in pieces of about two inches in length if for outdoor propagation, and much smaller when to be started on a cutting-bench. If it is desired to preserve the old bushes, some of the roots may be cut off at about a foot from the stools, without detriment to the parent bush.

These pieces are then put into a box, by first scattering an inch or two of soil over the bottom, on which a layer of cuttings is placed, then a layer of soil, a layer of cuttings, another layer of soil, and so on till all are disposed of, when the box is filled with soil to the brim. They may be wintered in a cool cellar,—a warm place will not do,—examining them occasionally, and moistening the soil if it should become so dry as to cause the roots to shrivel. Or the box may be dug in the ground outdoors on some dry spot, and covered sufficiently with soil to exclude frost.

In spring, as soon as the ground is fit for working, they are to be planted about six inches apart, in drills two to three inches deep and eighteen inches from each other. The planting consists in simply placing the pieces in the drill, covering with fine soil, pressing down firmly, and filling up the drill.

COVERING AMPUTATED LIMBS.

When limbs of considerable size, or indeed any limbs not so small as to heal over in one or two seasons, are removed from a fruit-tree, it is very desirable that the wound should be covered with something to protect it from the weather. If this is not done, rot will soon commence, and extend rapidly inward and downward, affecting the whole tree below the wound, making it unsound as well as short-lived, and more or less unproductive while it does live.

Various preparations are recommended and used for this purpose, most of them being cements of a water-proof character, such as grafting-wax, a solution of shellac in alcohol, or "mastic," made by boiling pine tar to expel most of the volatile matter, adding about ten per cent. of bees-wax and thickening with finely powdered clay, six or eight ounces to a pound of tar. This is added to prevent the cement from running, under the heat of the sun. We have used such a cement for many years, and have found it preferable to any other of a similar char-

THE RANCOCAS RASPBERRY.

acter. Shellac scales off, and does not yield to the growth of the wood and bark as the wound heals over. Grafting-wax becomes oxidized and crumbly, cracking and splitting off so as to expose the wood, on large cuts, before they are well healed. But the tar mastic never scales off, cracks, or becomes hard. It will be found still perfect in the form of a ball adhering to the center of the scur, after healing is complete. On trees of vigorous growth, hard-wooded and entirely iron-clad, like the Siberians and Russians, it answers every purpose.

But all these various water-proof cements have the serious defect of not only excluding moisture from without, which is desired, but also of confining the moisture from within, which is, of the two, the more potent cause of decay. For several years past I have been using for this purpose the ready-ground Venetian red, common (not chroma) yellow, raw or burnt sienna, and the like. As they come in the cans they are quite thick, requiring to be thinned for ordinary painting, but

just right for covering tree wounds. I use a small flat badger brush, an inch or an inch and a quarter wide and rather thick, for applying the paint, and find one coat usually enough, though as I go around the orchard every spring to cover the new cuts I often give the old ones of large size another dab. If you desire to make the wounds conspicuous, so as to be easily seen and repainted, Venetian red is the best paint to use for this purpose; but if, on the contrary, you desire to make them inconspicuous, raw sienna gives a color nearest to that of the surrounding bark.

This application has the great merit of allowing the transpiration of inward moisture, while excluding external wet. Trees with the least tendency to black-heart (which indicates injury from severe cold, and a lack of hardiness of the iron-clad sort), will always "bleed" more or less from cuts, the disorganized sap exuding and loosening the shellac, wax, or mastic covering, and often running down and blackening the bark. I have not seen any of this where thick paint has been used, the inward moisture evaporating through the paint covering as fast as it comes to the surface. I consider this a great advantage, as the overflowing sap has a cankering effect upon the bark around the wound, and prevents healing. It also seems to injure the bark of the trunk over which it flows.

S. H. HOSKINS, M. D.

THE RANCOCAS RASPBERRY.

Among the new fruits to be introduced the coming season this chance seedling Raspberry seems, according to the opinion of several experts, to be one of the most promising. Not having seen the berry ourselves we give the description by Mr. A. Hansell, on whose farm it was found:

"I found the Rancoas in a most unfavorable spot, surrounded by briars, and in every way neglected. Its vigor, productiveness, size, and earliness led me to transplant it. The bush starts late in the spring, when it branches freely. These branches load themselves with fruit, so as to almost conceal the leaves, presenting a mass of solid, red, ripe berries. This habit of the bush, in connection with the fruit ripening so quickly, renders it the easiest and cheapest variety to pick that we have over grown. It is a common remark of our pickers that they would rather pick the Rancoas for two cents per quart than any other variety for three cents.

"The plant suckers freely, and so vigorous is it that it effectually smothered the quack grass that would otherwise overrun our ground. We do not hold back the suckers, or even trim out the old fruiting canes during the summer; but in the fall, after the rush of work is over, we go through and cut out the old canes, and thin out the suckers, leaving only sufficient for the next season's fruiting. The canes left for fruiting are then holed about two and a half feet from the ground. It is the busy man's if not the lazy man's berry.

"It will produce twice as many quarts per acre as the Brandywine. The bushes have never been in the least injured by the severest winter weather, and the foliage has never shown a trace of yellows, scald, or burn."

THE MAY KING STRAWBERRY.

Another now candidato for public favor and supremacy in the field and garden, at this time, is the May King Strawberry, well represented in our life-like illustration. It is now first offered by John T. Collins, of Moorstown, N. J., who says:

"Of Strawberries in fruit, the past season, the best that I saw, taking all points into consideration, was the May King, a seedling raised by Thomas Zaue, of Camden County, N. J., from seed of the Creseent, and ho claims it earlier than the Creseent.

"The vine is very vigorous and healthy, prodnetivo, with perfect blossoms; the berries are of largo size, very bright scarlet color, and of best quality.

"Thomas Zane had one-quarter aoro in fruiting this season on sandy loam, moderately rich soil, from which ho picked, May 24th, 12 quarts, and during the season 1822 quarts, which sold at wholesale for \$330.

"I never saw a finer crop of nice fruit than of this variety, and intend to plant it largely for fruiting for market, and do not hesitate to recommend it either as a profitable market berry or one that will give best satisfaction to amateurs."

GRAPE CUTTINGS.

Of the different fruits, Raspberries and Grapes only give me complete satisfaction. These never fail to yield a full crop, and I find it no trouble to secure a healthy growth of wood. A Pear, Plum, Peach, or an Apple orchard, or a Strawberry patch, I can maintain only at the price of unceasing vigilance.

I propagate Grapes entirely by cuttings, and have always had highly satisfactory results. The plan I have pursued during the past

two or three years is this: I take the cuttings either at the time when I prune the vines in autumn (which is the easier and better plan) or later. If I select them at the former time, I plant them at once. For this purpose a rich, loamy, warm soil is necessary; and it must not bake or crack. If the cuttings are not made at the time of pruning, I pack them in damp earth in the cellar. It will do as well to place them in the open ground, if they are protected from freezing. They are thus allowed to remain till spring, when they are planted out.

The best soil for cuttings is a light, porous one; and I have to make mine so by the addition of sand. To plant, upon a trench six or seven inches deep. This can be done with a single diamond plow; but better, though slower, work is done with a shovel. It is a good plan to stretch a line and make the trench along one side of it. The side of the trench nearest the line should slope

toward it at a considerable angle. This work is done as soon as the soil can be stirred in the spring. The cuttings are laid against the sloping side, five or six inches apart, and placed so that the upper bud is just below the level of the surface. I then fill the trench till the dirt comes above the lower bud, and make it solid. I then take a light spadeful of fine earth and press it against the cuttings, covering all but the top. This dirt should be patted with the back of the spado till it is quite compact, and should then form a layer about half an inch thick. The trench is left in this condition—partly open—till the beginning of the growing season. Then the side of the trench next the cuttings is given a liberal application of fine, well-rotted manure. The filling of it is completed with the hoc or cultivator in rooting out the first foreign growth which appears. But if the weather

sand. They are covered to a depth of half an inch. The sand is kept moist, and as roots are produced more slowly and at a lower temperature than leaves, at a temperature of 40° or 50°, to encourage the growth of roots. The air above the sand should be several degrees yet colder. After a sufficient root formation has formed, the temperature of the sand is gradually raised. When the plants have made a growth of two or three inches they are "potted off," which must be done two or three times during the summer, each time using larger pots; or the plants may be put in a cold frame and gradually hardened till they can bear exposure.

"Mallet cuttings" are made by leaving a short section of the older wood attached to the cutting, or by using strong laterals with a portion of the cane attached. This requires much wood, as only one cutting can be made of each shoot or lateral. The only advantage mallet cuttings have over ordinary ones is that in the case of light cuttings the mallet increases the probabilities of success, as it furnishes additional material for the needs of preliminary growth.

JOHN M. STAHL.

FALL PLANTING STRAWBERRIES.

To the question, What are the wants of the Strawberry when planted in the fall? the veteran Strawberry-grower, M. Crawford, of Ohio, answers as follows:

"Now, what are the wants of the Strawberry when planted in the fall? The soil for the Strawberry should be rich and moist, but not wet. It matters not whether it be sand, clay, or muck, so that it furnishes anchorage for the plant and contains an abundance of the elements necessary

to its growth. It should be stirred to a good depth, but little or no poor subsoil should be brought to the surface. It is well to have it prepared some little time in advance, so that it may have time to settle somewhat before the plants are set. The surface should be rich. This is especially important with fall-set plants, as their roots have comparatively little time to go far in search of food.

"There is another advantage in encouraging surface roots; they are not drawn out nor broken by the expansion of the water in the soil when it changes to ice, but rise and fall with the ground. Roots that run deep are apt to be broken or drawn out—as Red Clover—while White Clover roots remain uninjured, although frozen and thawed a dozen times. If the soil has been enriched for a previous crop, so much the better; but if not, well-decomposed stable manure may be worked into the surface either before or after setting the plants."

THE MAY KING STRAWBERRY.

is droughty (which is not the case here one spring in ten, however), I fill the trench sooner. I make the trenches east and west, with the slope facing the sun. This I consider a point of considerable importance.

Cuttings must be of well-ripened wood. Some say to take large ones, but I prefer a medium size. They may have only one bud, or as many as can be cut on a growth of six inches. Perhaps two or three buds are the best numbers. Cut immediately below the lower bud and about an inch above the upper one. Make a smooth, slanting cut, on the side opposite the bud. Cuttings of single buds are generally made when wood is scarce, or when the variety to be propagated is rare and valuable; but such cuttings are often made when common varieties are to be propagated extensively.

With cuttings of a single bud I have not had so much experience. They are placed horizontally (end upward) in clean, sharp

The Flower Garden.

THE GOLDEN FLOWER.

(*Chrysanthemum.*)

Ere Advent dawns with lessening days,
While earth awaits the angel's hymn,
When bars as branching coral sways
In whistling winds each leafless limb,
When spring is but a spendthrift's dream,
And summer's wealth a wasted dower,
Nor dews nor sunshine may redeem,
Then autumn coins his Golden Flower.

Soft was the Violet's vernal hue,
Fresh was the Rose's morning red,
Full-orbed the stately Dahlia grew—
All gone! Their short-lived beauty shed;
The shadows lengthening stretch at noon,
The fields are stripped, the groves are dumb,
The frost-flowers greet the icy moon—
Still blooms the bright Chrysanthemum.

The stiffening turf is white with snow;
Undimmed its radiant disks are seen,
Where soon the hallowed morn will show
The wreath and cross of Christmas green,
As if in autumn's dying days
It heard the heavenly song afar
And opened all its living rays—
A herald-lamp of Bethlehem's star.

Orphan of summer, kindly sent,
To cheer the waning year's decline,
Of all that pitying heaven has lent,
No fairer pledge of hope than thine;
Yes! June lies hid beneath the snow
And winter's unborn heir shall claim
In every seed that sleeps below
A spark that kindles into flame.

Thy smile the scowling storm-cloud braves,
Last of the bright-robed flowery train,
Soft sighing o'er their garden-graves,
"Farewell! farewell! we meet again!"
So may life's chill November bring
Hope's golden flower, the last of all
Before we hear the angels sing
Where blossoms never fade and fall.

OLIVER WENDELL HOLMES.

SEASONABLE HINTS.

November may well be termed "the *Chrysanthemum Month*" as appropriately as June "the Month of Roses." *Chrysanthemum* shows are becoming as established and attractive features in the proceedings of our horticultural societies as any other special exhibitions of the year. It is safe to assert that in no other class of plants has so much and so rapid improvement been made as in this; and those who have never seen the newer varieties can hardly form an idea of their glorious beauty, and should not miss an opportunity of visiting some of the special exhibitions to be held in most large cities during this month. The principal types of *Chrysanthemums* are well shown in the excellent illustration, for which we are indebted to Mr. A. Blanc, the celebrated artist of Philadelphia.

Autumn-sown Flower Seeds.—Wherever the hardier kinds of annuals, biennials, and some of the perennials have been growing, and the ground has not been disturbed, many young plants will be found coming up in the beds the following spring. These self-sown seedlings are generally better and will bloom earlier than those from spring-sown seed, plainly showing the advantage of sowing this class of plants in autumn, especially those wanted for early blooming. Most biennials sown in the fall will bloom the following summer, if lightly protected during winter.

NEW ROSES.

The number of new Roses introduced this autumn is not inferior to that of previous seasons. Some of these novelties will, of course, never supplant any of the many valuable older kinds, but others are decidedly distinct and possess real merit. As it may interest and serve as a guide to the readers of THE AMERICAN GARDEN, I have condensed the following list as comprising the very best introduced this season by Freuch growers.

TEAS.

Annette Murat (Lovet).—Lemon-yellow, free bloomer, very fine.

Alexandrine Brunel (Levet).—Very pure white, fine shape.

Charles Legrady (Pernet fils).—Light crimson or dark pink, best shape, nearly full.

Souvenir de Gabrielle Drevet (Guillot).—Large, full, white, shaded light salmon, center rose.

HYBRID PERPETUALS.

Nathanielde Rothschild (Pernet père).—Very large, globular, nearly full, delicate tender rose.

Admiral Courbet (Dubrenil).—Fine shape, full, pinkish carmine, exquisite fragrance, very free bloomer.

Madame D. Wettstein (Levet).—Cherry-red, very free bloomer, fine shape.

Doctor Dor (Liabaud).—Very large, full, dark cherry-red, shaded darker, scent of Teas.

Etandard de Lyons (Gonod).—Large, fine shape, purplish-crimson.

Madame Pitaval (Liabaud).—Large, full, light cherry-red, good shape.

Madame Stingue (Liabaud).—Large, purplish-red, fine.

Monsieur Hoste (Liabaud).—Large, full, velvety crimson, good shape, very fine.

Gloire Lyonnaise (Guillot).—Large, full, fine shape, vivid creamy-white, center yellowish, fine fragrance, very free bloomer.

BENGAL.

Jean Sisley (Dubrenil).—Medium size, full, fine shape, pure white, very free bloomer, very desirable for pot culture and forcing.

Lyons, France. JEAN SISLEY.

THE DWARF NASTURTIUM.

(*Tropaeolum nanum.*)

One of the best annuals we have for bedding purposes where vivid masses of color are desired, is the *Tropaeolum*, or *Nasturtium*—"Sturton," our grandmothers used to call it. Some varieties are given to climbing in a kind of straggling, sprawling fashion, which suits them for any very effective use anywhere; but the dwarf varieties are very good for beds, not growing much over a foot in height, and sprouting out into well-shaped plants, which will be covered the greater part of the season with brilliant yellow, unmarred, and velvety crimson flowers. Some varieties are a pale sulphur yellow, striped and spotted with vermilion.

This summer I had some in my garden that were almost a pink,—a sort of rose-color suffused with buff,—very unlike any I had ever seen before, and, though not as showy as the darker varieties, they were really prettier. This flower is extensively used for bedding purposes. The foliage is a pea-green usually, and shows off the brilliancy of the flowers well.

SPRING FLOWERING BULBS.

During this month, and frequently until late in December, the lovers of beautiful flowers can plant hardy bulbs, which will bloom from early spring into the autumn and delight the eye, while they perfume the air with their sweet odors.

"Well they reward the toil,
The sight is pleasant, the scent regal;
Each opening blossom freely breathes around
Its gratitude, and thanks us with its sweets."

When scarcely a blade of green grass is to be seen, their tiny leaves, closely shrouded in a green hood, push forth from the ground, and in a short time the most fragrant flowers, and also those of the gayest and loveliest hues, repay us for all the labor expended upon them.

Good sound bulbs are requisite for perfect success, and yet the highest-priced bulbs will not always give the best satisfaction. The beds in which bulbs for early flowers are planted should be well cultivated, i. e., a portion of the soil should be taken out, and a good supply of year-old stable manure should be dug in deeply. Then restore the soil, and mix it with at least one-third sand. A sunny location, and one exposed to the morning and midday sun, will make the best position for a new bed. It should be raised several inches above the turf or walk, to enable all the rain and moisture to drain off and not settle upon the bed. Raise it in the center, and let the sides slope very gently.

Most spring flowering bulbs may be planted directly, amidst the shrubbery, or in beds of perennials, the tops of which are to be cut off when decayed. There is room for bulbs in the smallest of gardens, as the most of them will have finished their work of beautifying the earth before other flowers are in bloom. According to localities the time for planting bulbs should be decided, and before the ground freezes they should all be snugly laid away to await the resurrection of the spring.

THE HYACINTH.

The Hyacinth, so aptly called the *Domestic Flower*, because it is so greatly loved by many hearts, is the most desirable of all early flowers. Haarlem, in Holland, is the chief source from whence come the thousands and hundreds of thousands of bulbs imported to this country. The florists of that city make their culture a strong feature of their nursery gardens, and the soil is exactly adapted to them, being of a light vegetable mold, well mixed with sand, and a substratum of sand, which drains off the heavy rains of early spring.

In making separate beds of Hyacinths for decorating the lawn, and edging them with Snow-drops and Crocuses, remove the soil at least a foot in depth, and spread over the bed a compost of one-third well-decayed stable manure, one-third leaf mold, or rotted sods, and half the quantity of the whole compost, of a sandy loam. Spade up this mixture well, and let it lie a few days, then spade again. But if you can procure the black, sandy soil under the forest's pines, you will have exactly the compost fitted for growing all kinds of bulbs. Plant the Hyacinths in circles, clusters, or straight rows, and at the depth of two, three, or four inches, according to size of bulb. Have a panful of scouring sand close by (not sea-

sand), and at the bottom of each bulb put in a small handful of sand, then press the bulb down upon it closely. Dig the holes with a small trowel, and press down the soil well. When the ground is frozen solid, spread over the beds a layer of four to five inches of leaves, or straw, or coarse stable litter. This will keep the ground from alternately freezing and thawing, which is so apt to kill the bulbs. When first planted, a top dressing—half an inch or more—of sand will help to draw the heat of the sun in early spring. When a part of the strawy covering is removed, which should be done as soon as the tops of the sheathed leaves are seen, press the soil closely round each bulb, to prevent the cold night air from injuring the flower, and in a fortnight or so take off all the winter coverings, and soon the flowers will appear.

In the choice of bulbs, select those which are firm and solid at the base of the root. For outdoor culture, the double varieties are the most showy, as their flowers will form an upright cone of perfect beauty. Also due heed should be given to their height of stem and flower and their time of blossoming. The early varieties of tall growth should fill the center of a bed to be edged with Crocus and Snow-drops, and the spaces can be filled in with other kinds of low early bulbs. Some thought should be given to the mingling of the shades—dark and light blue, porcelain, and white, and of the shades red, carmine, rose, and blush; also of the tints of yellow and cream color. A bed of Hyacinths makes one of the rarest of flower shows in spring-time, and seems an almost indispensable adjunct to every real flower garden.

THE TULIP.

This "Pop of Flowers," as it has been correctly styled, is truly a gorgeous addition to the flower beds, and so easily are they raised that clumps, elusters, or whole beds of them, should be planted this month or next; and then one can patiently wait for the time when a blaze of glory will attract every passer-by, as well as fully repay to

one's self all the care and expense in their gorgeous brilliancy. They are natives of Persia, and called *Tulip*, from *tulipan*, a turban, which the calyx of the flower resembles. The Turks brought the bulbs from thence, and sent some of them to Vienna, where they were cooked like Onions, and not proving palatable, were then preserved in sugar; but not being a success as *compotes*, the remainder were thrown upon a compost heap, where they grew and bloomed in perfect beauty. The Swiss botanist, *Conrad Gesner*, did not see the Tulip until 1559, and as he described it scientifically, *Thunus*,

Tulips are divided into three classes, viz.: *Roses*, *Byblomens*, and *Bizarres*. The *Roses* have rich crimson, cherry, pink, and scarlet stripes and veinings on a pure white ground; they grow eighteen inches high and have large, well-formed cups. The *Byblomens* are marked with black, lilac, and purple stripes and veins on a white ground; while the *Bizarres* have a yellow ground, feathered and veined with scarlet, pink, purple, lilac-crimson, rose, and cherry. These classes are again divided into flamed and feathered, striped and veined Tulips, until their number is multitudinous. A feathered Tulip has a

dark-colored center, shading lighter toward its edges.

Besides these there are the dwarf *Duc Van Thol* varieties, which bloom the earliest and will make lovely beds of flowers, mingled with Hyacinths, Crocus, and Snow-drops. The *Tournesol* varieties bloom next to the *Van Thols*, and the two kinds, when planted together, will make a gorgeous bed in spring. The *Double Tulips* and the *Parrot Tulips* come next in order, the latter being the most unique of all the varieties, the edges of their petals being fringed like fringed *Petunias*. These two kinds can be mingled in a bed, which will prove extremely brilliant; or, if planted around low Evergreens, in a circle or in groups, they

many years after, gave it the specific name of *Gesneriana*, in honor of the botanist *Gesner*.

The Tulip mania of the seventeenth century, doubtless, all our readers are familiar with, as it belongs to the *History of Holland*, having commenced there, but its influences were transplanted to England and France, and had not our mother country been engaged in civil war, the speculations might have been as ruinous there as among the Dutch. It proceeded, however, from the love of gambling, far more than the love of flowers, and Tulip bulbs were sold on time, as stocks are at the exchange, and those that were short were as badly shorn as are the "lambs of Wall street." But the Dutch amateur florists loved their bulbs as much as rosarians now love their Roses, and the poet Crabbe wrote of them:

"With all his phlegm, it broke a Dutchman's heart,
At a vast price, with one loved root to part."

will show to great advantage.

Sandy loam from sheep or cow pastures is excellent for the growth of these bulbs. Remove the sods from old pastures and dig up wheel-barrow loads of the fresh soil; or prepare a bed as directed for Hyacinths. Rich garden soil, mixed with very old manure and sand, will grow the Tulip in its perfect beauty, but fresh compost from the cow-yard or stable would burn up the bulbs. Plant them early in the season, and set them from three to four inches in depth, and four inches apart. Put a little sand at the base of each bulb, and scatter sand all over the bed, and protect like other bulbs, with leaves or straw compost. After flowering let the leaves dry up, then cut them off. Every three years take up all the bulbs and remake the bed, or plant them in another place.

Crocus, Daffodils, and Lily of the Valley require similar treatment, and are all needed to make up a complete spring garden.

DAISY EYEBRIGHT.

The Window Garden AND GREENHOUSE.

THE WINDOW GARDEN FOR NOVEMBER.

DISPOSITION OF PLANTS.

By arranging your plants so that all of them may be suited, as your convenience will best allow, as regards a high or low temperature, sunshine or shade, you may be able to provide for quite a number of your pets.

Geraniums, Fuchsias, Carnations, Petunias, Ageratums, Meteor Marigolds, Mignonette, Sweet Alyssum, Stevias, and Abutilons in blossom like a sunny place in the window, but not a high temperature; merely keep out frost. Tea-scented and China Roses, Callas, and Begonias also like a sunny window, and warm but not close quarters. Of course these are as hardy as those before mentioned, but in order to get them to bloom well in winter we have to humor them a little.

Chinese Primroses like an east or west-facing window, but if shaded from strong sunshine by a piece of paper or muslin, will thrive in a south-facing one, or, if need be, will bloom nicely in a north or sunless window. Oxalises should be suspended in sunshine. Bonvardias, although warmth-loving plants, will bloom well associated with Carnations. Cinerarias and Calceolarias love the light, but dislike direct sunshine. Grow them in a cool temperature; merely exclude frost.

Coleuses, Iresines and Alternantheras, either as old plants or rooted cuttings in store pots, prefer warm, sunny quarters. Rooted cuttings of Lantanas, Heliotropes, Ageratums, Verbenas, Salvias, Fuchsias, Abutilons, and Geraniums will do with less warmth and sunshine, and may be kept toward the inside while the plants in flower are placed next the windows. At this season these cuttings require but little water, our chief object being to discourage growth, and to keep them as inactive as possible till spring, without hurting them.

Oleander, Camellias, Azaleas, Sweet Bay, Orange-trees, Tea plant, Banana shrub (*Magnolia fuscata*), and English Ivy will do well in a cool room and a north-facing window; of course they would like some sunshine, but in winter it is not indispensable. Indeed, except the Orange-trees (I never like to put them in the cellar), if need be, we may winter these plants safely in a cellar having an average temperature of 35° to 45°, when, although they shall not need much water, we must never let them get very dry at the root.

Ferns of all sorts should be kept in full or partially sunless windows, and never be allowed to get dry. Cactuses of all sorts enjoy light, sunny quarters, but they are very accommodating plants, and providing we keep them dry, we can safely winter them in the most sunless windows we have.

Hard-wooded plants, Abutilons, Lantanas, Fuchsias, Lemon-scented Verbenas, and Grape Myrtles, either pot-grown or lifted and potted, and cut back from outdoor plots, may also be safely wintered in frost-proof cellars; in the case of recently potted plants the roots must be kept a little moist through

the winter, but if they are pot-established plants, getting pretty dry is not likely to hurt them.

Yuccas, Century Plants, and large Cactuses may also be wintered in cool but dry and frost-proof cellars. Camma, Dahlia, and Caladium roots may likewise be stored in a dry place.

FROZEN PLANTS.

When we winter plants in our dwelling-houses, we should never let them get frozen. Out-of-doors, in the open garden, hardy plants submit to frost with impunity; but these same plants, if grown in pots and then subjected to hard frost, would get more or less injured. How much more, therefore, would be the injury done to tender plants, or even half-hardy ones, when subjected to frost? But in the event of some of our house-plants getting frozen accidentally, as soon as discovered we should place them in a low temperature, only a few degrees above the freezing-point, and keep them dark, till the frost has altogether left them, and for some days afterward we should keep them

TULIPA GREIGI.

cool and away from sunshine. If the soil in the pots is frozen hard, bury the plants, roots, and stems in earth or sand in a cool cellar, so that it may thaw out gradually. Should Heliotropes, Coleuses, or other tender plants get "burned" by frost, it is utterly impossible, no matter how soon we "catch" them, to restore to health the leaves or shoots that get frozen. But Geraniums, Century Plants, and many more may bear slight frosts without apparent injury.

WATERING PLANTS.

Don't overwater your plants. Geraniums, Callas, Justicias, and other fast-growing plants, now in active growth or coming into bloom, require plenty of water; succulent plants of all kinds, very little; evergreens, merely to be kept moist; and plants being wintered over for next summer's garden, merely water enough to keep them from wilting. If any of your plants are sick, keep them dry rather than wet, and never, under any circumstances, give liquid manure or other stimulants to a sick plant.

WM. FALCONER.

GREIG'S TULIP.

(*Tulipa Greigi*.)

This as yet rather rare new Tulip is a native of Turkestan, and is one of the most showy and distinct species in cultivation. Its large, goblet-shaped flowers are originally bright orange scarlet, but they vary also to purple and yellowish. The leaves, the margins of which are boldly undulated, are of glaucous color, the entire upper surface being brightly spotted with purple or chocolate brown. The plant is a vigorous grower, its stalks reaching a height of twelve inches or more, and the diameter of its flowers from four to six inches. For forcing in the house, or for outdoor culture, it is equally well adapted.

THE PASSION FLOWER.

(*Passiflora*.)

Not only in collections of greenhouse plants do we see the different species of Passion Flowers cultivated, but also by persons who have no other accommodation for keeping plants but the window; and it is with remarkable success that some window gardeners manage to grow most of the hardier species. As THE AMERICAN GARDEN is found in more homes in Ohio than any other horticultural paper published, and it is for the benefit of its readers that I write, these suggestions about the cultivation of one of the most beautiful climbers will reach the eye of more flower-lovers than through any other means.

Passion Flowers are rapid and rampant growers if liberally treated. The best soil for them is good fibrous loam, thoroughly rotted manure, and well-decayed leaf mold, adding sufficient sand to insure the free percolation of water. Commence to train the shoots when small, and continue to do so, else they will soon get tangled, so that it is difficult to train them properly when allowed for even a short time to grow at will. They require plenty of room, both for roots and tops, and when growing rampant, plenty of water. Unless properly attended to in this particular, they lose their leaves on the mature wood, and soon show a mass of unsightly stems, which deprives them of half their beauty. The best place to train them during summer is on the veranda, or on trellises erected for the purpose in the garden.

Many of the species may be taken from the pots and planted in the open ground, using good, rich soil, and they will grow and flower the greater part of summer. In the fall, they may be lifted, cut back, and potted, keeping them in the house partially dry until they again start into growth. I know several ladies who adopt this mode of culture year after year with remarkable success. If wanted as specimen plants for the decoration of the parlor during winter, they have to be kept in pots, out-of-doors, during summer, carefully attended to, and taken in before frosty weather in the fall. I have seen some beautiful windows, made by training the vines around the frames, others hanging in graceful festoons, thus forming fine surroundings for the other window plants.

Some of the finest species are, in a dry atmosphere, subject to attacks of red spiders; but seldom is this pest seen when the plants are kept outside during summer and properly watered at the roots. When trained

on the rafters of greenhouses, the rod spider is especially apt to infest the plants, greatly marring their beauty. It gets on during summer by keeping them in the house, and unless thoroughly syringed on both wood and foliage, it is difficult to eradicate when once a foot-hold is gained.

Some of the best varieties for general culture are :

Passiflora alata.—The leaves of this species are large and glossy. The stem four-angled, flowers dark crimson, rays crimson, purple, and green; easily grown.

P. edulis.—Perhaps one of the commonest of the white and blue flowered kind; easily grown. The fruit is large, dark purple, and good for eating. It is a native of Brazil, and comparatively hardy.

P. carulea.—This one grows easily; purple flowers, leaves dark green, and will rapidly cover a large space during summer.

P. princeps.—The flowers of this fine species are bright scarlet, produced in long racemes. It makes a splendid specimen plant, especially when trained on a flat trellis.

M. MILTON.

GROWING BULBS IN WATER.

In cities, the procuring of soil and pots for plant culture presents frequently a great obstacle to those who would gladly have their rooms bright and fragrant with flowers during the dreary winter days, if it could be easily accomplished. Whilst, when soil and pots are convenient, we do not advise the growing of bulbs in water, to persons not so situated this mode recommends itself by its simplicity, ease, and pretty effect. The accompanying illustrations show some of the many neat and pleasing forms of glasses used for this purpose.

After the glasses have been filled with rain or soft brook water up to the neck, the bulbs are placed on the top, so that their base just touches the water. They are then put in a dark and moderately warm place—a closet or cellar—for three or four weeks, or until the glasses are partly filled with roots, when they should be removed to the light, and gradually to full sunshine, where they will soon make rapid growth and develop their fragrant flowers.

A GOOD WINDOW BOX.

One of our correspondents gives the following directions for making a cheap and durable window box:

Take rough boards one inch thick and nail them firmly together in the shape desired; six inches high and wide is a good proportion. Nail molding on the corners and bottom and let the top piece project into the box one-fourth of an inch, and cover the outside spaces or panels with some pretty-patterned oil-cloth. Then mix three parts of builders' cement and one of sand together with water, and plaster the inside of the box upon the rough boards, flush with the molding. This will dry hard without a crack, if mixed properly, and will be water-tight for one and sometimes two seasons, and can easily be renewed, if necessary, after the box is empty in the spring.

GOOD AND BAD SEED.

In my early days of garden experience, our most reliable excuse for non-success was "bad seed." At the time I had most confidence in the above dogma, I was just leaving the ranks of the faithful who sow, year after year, greenhouse seeds in the open border, and facing toward the better results careful observation always gives. As opportunity has occurred for the past nineteen years I have subjected seeds to the damp flannel treatment, and my conclusions are as follows:

1. Much less worthless seed is sold than is generally imagined. I have found the larger proportion in packages sold on commission.

2. In nineteen cases out of twenty, germination is governed by conditions *after* planting.

The knowledge of these facts does not insure my invariable success, but does make me charge the failure to my own want of skill. Here, only last spring, I sowed Achimenes and Gloxinia side by side. The Gloxinia came up like Mustard, and I be-

lieve every seed in the package germinated, but only three or four of the Achimenes came up. Here was a case of bad seed at last; but, on comparing results with a lady who had a very small pinch from the package in question, I found that hers had come up remarkably well. I must try it again.

WM. M. BOWRON.

THE FUCHSIA.

A well-grown Fuchsia is one of the most graceful and handsome blooming plants in cultivation, and nothing can surpass the grace and beauty of a perfect specimen during its season of bloom. With the exception of some two or three varieties it is not a winter-blooming plant.

The Fuchsia is easily cultivated, succeeding best in a compost consisting of two-thirds turfy loam, one-third well-decayed manure, and to each bushel of this mixture add two pounds of bone dust. Mix the whole thoroughly, and use the compost rough, but pot the plants firm. Place the pots proportionate to the size of the plants, and see to it

that they are well drained. Use porous or soft-baked pots by all means.

They do best when grown in a light situation, and in a temperature of from 55° to 60°. They love warmth and moisture, but cannot bear full exposure to the bright sunshine, hot soil, or dry air. The secret of obtaining good specimens is never to permit the plants to cease growing until they attain the desired size. Young plants obtained in the spring should be liberally cared for, and repotted as often as necessary until they reach the desired size, and if we wish to produce handsome specimens care must be taken about training them when young, pinching back the shoots as often as they show a tendency to grow out of shape, and supporting the main shoots by neat stakes. When growing, water freely and syringe gently every other evening, and when they commence to bloom give manure water twice a week, which produces large and well-colored flowers.

They may also be planted out early in May, in a deep, well-enriched border, in any situation where they can be sheltered from the hot midday sun. Thus grown, they should be well supplied with water at their roots, and gently syringed every other evening; they must also be supported with neat stakes. On the approach of cold weather they should be cut back, taken up and potted, using as small pots as possible; then they should be placed in a cold frame, or any other sheltered situation, until it is time to bring them inside. When first potted, water thoroughly, afterward sparingly.

The best way to winter Fuchsias is to place them in a dry, frost-proof cellar, or any cool, dry situation, where they can be kept in a partially dormant state until the first of April, when they should be started into growth by removing them to a warm, moist place. Water carefully until growth commences, when they should be turned out of their pots; have about one-half of the soil removed from their roots, and repotted in as small pots as possible; trim into shape, and treat as advised for young plants.

The winter-flowering varieties (*F. speciosa* and Earl of Beaconsfield) succeed best when planted out in the flower border, among the other greenhouse and border plants. Trim into shape when planting out, water if necessary, and take up and repot about the first of September. Give, if possible, a light, sunny situation, an average temperature of 55°, and plenty of water.

Propagation is effected by cuttings of the half-ripened wood, and if the young plants are liberally cared for, nice flowering plants will soon be obtained.

For the benefit of amateur cultivators I enumerate a dozen of the most desirable summer-blooming varieties:

Single varieties.—Aurora superba, Arabella (Improved), Rose of Castile, Rose of Denmark, Striped Banner, Wave of Life.

Double varieties.—Avalanche (Smith's), Avalanche (Henderson's), Depute Berlet, Jules Mongee, Mad. Van der Strass, Snow Fairy.

For winter blooming add Earl of Beaconsfield and Speciosa.

CHAS. PARNELL.

HYACINTHS GROWING IN WATER.

Lawn and Landscape.

TREES FOR SHADE AND SHELTER.

At a meeting of the *Massachusetts Horticultural Society*, the subject for discussion was, "Planting Shade and Shelter Trees; the most desirable varieties and the soils best adapted thereto." It was opened with a paper by Leander Wetherell, who began by speaking of the importance of tree planting as affording shade from the burning sun, in a country remarkable like ours for the clearness of its atmosphere, and shelter from cold winds for gardens and orchards, as well as for homesteads and the contiguous grounds.

Trees for these purposes should be chosen with reference to their adaptation to the soil where they are to be planted; and also to beauty, that they may be decorative as well as useful. An Oak, Elm, or Maple tree, shading a modest dwelling with a grass plat before it, makes it more attractive than a showy mansion unprotected by a tree. The pilgrim and wayfarer welcome trees by the roadside, under whose umbrageous boughs they may pause and rest their weary limbs. Trees should therefore be planted by the roadside, and groups should also be provided in pastures, where cattle may find shelter from the heat of the sun.

The essayist said that one of the most distinct and pleasant recollections of his boyhood was that of four large trees near the house—a majestic White Oak, a stately Elm, and two shell-bark Hickories; and a little farther from the house, three large Chestnuts, which, as well as the Hickories, were quite notable for size and age. They were also good annual nut producers, the nuts from one of the Hickories being remarkable for size and quality; and the Chestnuts, Hickory nuts, Apples, and sweet cider did much to make cheerful the domestic rural life.

The influence of trees upon the healthfulness of the atmosphere was next considered. They not only, like other plants, imbibe carbonic acid, but air charged with moisture is deprived of it by trees. Localities in Italy have been preserved from fever by screens of trees, and it is generally conceded that forest screens are protections against noxious exhalations from marshes when located at the windward of them. The swamps of the Southern States were not unhealthy, even to white men, so long as the forest remained. Let all, therefore, who own land enough to plant a shrub or tree fail not to plant one before another season, if they have not already done so. What shall it be?

THE OAK.

This inquiry led to the consideration of the selection of trees for planting, and the first named by the essayist was the Oak, which has been called the King of the Forest. The essayist spoke at some length of the historical and poetic associations of the Oak, and mentioned several trees renowned for their size, age, and associations,—mostly in England,—but concluding with the celebrated Charter Oak at Hartford, Conn., and the Wadsworth Oak at Genesee, N. Y., near the Genesee River, in one of the most fertile valleys of the Middle States.

The trunk measured thirty-six feet in circumference, and the tree attracted large numbers of travelers journeying to Niagara Falls and the West. The essayist had never seen so remarkable a specimen of the Oak or any other indigenous tree east of the Mississippi River.

The Oak is acknowledged to be the most picturesque of trees, and as a shade tree cannot be excelled. The favorite species with the essayist is the White Oak (*Quercus alba*), of which Mr. Emerson said that it is beautiful in every stage of growth, and concluded his description of it with these words: "Let every one who has opportunity plant a White Oak." He measured one in Bolton that was nineteen feet in circumference just above the surface of the ground, and one in Greenfield that was seventeen and a half feet. The one referred to as near the homestead of the essayist was about fifteen feet in circumference near the surface of the ground. The soil best suited to the Oak is a strong, tenacious loam.

THE ELM.

The next tree named by the essayist was the Elm (*Ulmus Americana*), which is or was formerly a great favorite in New England, and especially in Massachusetts and Connecticut, where there are still many trees of great size, beauty, and grandeur. Some of the most magnificent specimens are found in the valley of the Connecticut River, in both States. It thrives best in rich, moist ground, such as is found along the banks of large rivers, between 42° and 45° of north latitude. The sturdy trunks and graceful boughs are unequalled, and it is among the early bloomers in spring. It is more easily transplanted than the Oak, as it roots nearer the surface of the ground.

THE MAPLE.

The Sugar Maple (*Acer saccharinum*), like the Elm, has long been a favorite shade tree in Massachusetts. It is the most notable tree of the Maple family. Its foliage is dark and beautiful, and free from insect or parasites, which cannot be said of the Elm. It is indigenously less common in eastern than in middle and Western Massachusetts. In Blandford a Rock Maple is mentioned by Mr. Emerson that was four feet through near the surface and one hundred and eight feet high, and when cut up produced seven and a half cords of wood. In Amherst, Belchertown, Stockbridge, Deerfield, and Sunderland are planted double rows of Rock Maples, which are magnificent decorations of the highways. The Sugar Maple is indigenous to sweet, rich, mountain soil.

Other trees named by the essayist were the Linden, a beautiful tree, the Beech, Horse Chestnut, Birches, Ash, Locust, Acacia, Chestnut, Mulberry, Ash-leaved Maple, Hickory, Black-walnut, Mountain Ash, Catalpa, Magnolia, Tulip-tree, Ginkgo, Larch, etc., some of which, he said, are more curious than desirable.

EVERGREENS.

The Evergreens must not be overlooked; among them the Cedars, Arbor Vitæ, American Holly, Yew, Juniper, White Pine, Silver Fir, and the black, white, Hemlock and Nor-

way Spruces were named. They are planted as ornamental rather than as shade trees, and are best adapted for shelter screens or wind-breaks. For the last named purpose the essayist did not hesitate to name the white Pine-tree as best. A white Pine-tree in Hingham was said, on the authority of the late Rev. J. L. Russell, professor of botany to the society, to have measured, at thirty-two years of age, seven feet in circumference and sixty-two and a half feet in height. The Pitch Pine, Scotch Pine, Norway Pine, and Norway Spruce, Hemlock, black or double Spruce, white Spruce, American Arbor Vitæ and Larch—the last a coniferous tree and a rapid grower, though not an Evergreen—should be included among trees for wind-breaks.

RAISING TREES FROM CUTTINGS.

A few varieties of forest trees, notably the Poplars and Willows, are very easily grown from cuttings of the wood, and are commonly propagated in this way. The new wood is used for this purpose,—that is, the wood of the previous season's growth. It should be cut in November or December, before any extreme cold weather occurs, and during mild weather when there is no frost in the wood.

Keep fresh by putting it away in sand, in the cellar, and work up into cuttings during stormy weather in the winter. They are made by simply cutting the wood with a sharp knife, into sections of about eight inches in length; then pack them away in sand or earth, in shallow boxes, so that the upper ends will be exposed to the air. Keep in this way until spring when the callus forms on the lower end, and they will start more quickly into growth than if cut in spring, just before setting them in the ground.

In planting them out, it is important that the lower ends should have the earth packed tightly against them, and to do this successfully it is necessary, if planting them in the nursery, to open a trench by stake and line, or, if in the forest, to throw out a spadeful of earth at each place where the cuttings are to be inserted. They should be set deep enough so as to cover up the terminal bud.

Forest Leaves.

PROTECTING YOUNG EVERGREENS.

All newly planted Evergreen trees are benefited by winter protection of their roots, sufficient to prevent the frost from reaching to their lower extremities. With tender and half-hardy kinds this becomes of still more importance. It is frequently observed that in localities where large specimens of certain species withstand the severest cold, newly planted trees of the same kind are killed the first winter. In most cases this is owing to the fact that the roots of the older trees have penetrated below the frost line; and our young trees, if we would have them live, must have the same conditions provided for them by artificial means—that is, receive sufficient mulching to prevent frost from reaching their lower roots.

With the more tender kinds, the tops should also be protected by loosely tying some coarse Evergreen branches or loose mulching around them.

Foreign Gardening.

A GARDEN IN PARA.

(Continued from last number.)

"What can you do with so many Oranges, Senhor?" we ask.

"Nothing," is the reply; "they give me great trouble by falling off and injuring the plants. I have five kinds in hundreds of bushels, and it would cost me more to gather them and to send them to market than they would bring; I willingly give them to any one who will gather them carefully."

The border on our right is full of Caladiums, of which Senhor Olinda has about fifty varieties, but at this season they are mostly at rest, and only the carpet of *Tradescantia zebrina* appears. From December to June the effect of the Caladiums, many with white foliage, above the dark mass of the *Tradescantia* is very striking. On the left is a long border planted with dwarf Bananas, *Hibiscus Indicus* in many varieties, *Dracaenas*, *Crinum Josephine*, which grows to an immense size and gives stalks of bloom so heavy that one would not wish to carry one away, *Alpinia vittata*, which is very richly marked, and a few Fig-trees in the background. In front, along the path, are great tubs with some of the newer *Hibiscus*, white, rose, scarlet, orange and yellow, double and single, some tall-growing Orchids, Crotons, among which *Mooreanum*, *roseo-pictum*, *Stewartii*, *Andreanum*, and *maculatum Katoni* are especially fine, and tall plants of *Aralia filiofolia* and *Gulfoylei*, the variegation of which last is superb.

Passing onward, we come to a wicket-gate opening into the quintal, or orchard. Long rows of Orange, Alligator Pear (*Persea gratissima*), Sapodilla, or Custard Apple (*Achras (Lucuma) Sapote*), Abio (*Achras Cambito*), Guava, and other fruit trees, extend before us, and on every side are low tables of plants. All the trees and the fences hang thick with Orchids, and the variety of foliage and profusion of flowers are wonderful.

The quintal is fenced on each side by a heavy palisade some ten feet in height, so that the surroundings are wholly shut out and the tables and trees are mostly in parallel lines, so one seems to be in an immense greenhouse with long aisles of brilliant plants. Close to the wicket, climbing up an Orange-tree, is a grand plant of *Monstera deltoidea*, the curiously cut leaves of which are as large as an umbrella. Tables close by hold one plant each of different species of Crotons, of which Senhor Olinda has about fifty. These plants, though by no means as large as many which stand around in great tubs, are each a specimen; all are so fine and yet so different, that it would be difficult to choose between them. A large round table is filled with white-leaved Begonias, *Pteris tricolor*, and Marantas, and another near, with Achimenes in about forty varieties, all masses of bloom. By planting in succession, Senhor Olinda has these in bloom every month in the year; they grow vigorously and flower freely.

Passing on, we come to a fine plant of *Roupelia grata*, which, disdaining the trellis provided for it, has mounted into a tree, and is just opening its shell-tinted, waxy flowers.

Meyenia erecta, both white and blue, forms large bushes, which are covered with bloom every day in the year.

A great plant of *Croton microphyllum* seems to hold the sunlight, and an immense *Anthurium crystallinum* shows great leaves veined with frost-work.

Some of the *Alocasius* are very fine, especially *Veitchii*, with leaves two feet long; *Sedmi* and *metallica*, bearing large, lustrous bronze leaves; and *zebrina*, with zebra-variegated petioles.

Dracena Goldiana and *Sansiviera Zeylanica* and *Guiensis*, all of the same general shading, are very effective.

Some *Ixoras*, especially *salicifolia* and *Williamsii*, were in brilliant flower, and many Ferns and *Lycopodia* on the ground under the tables are very attractive.

At the bottom of the quintal an unexpected sight awaited us. We had seen so much to admire that we thought we had seen the best, but the tables of Tydæas and other gesneraceous plants were, perhaps, more brilliant than anything in the garden. These tables are all covered with corrugated, galvanized iron roofing, supported on high posts so as to allow plenty of air, but yet protect the plants from the heavy rain and the fiercest sun. The iron plates, slightly inclined to shed the rain, are simply laid on horizontal strips of board which stretch between the posts. Violent winds are unknown in Para, and there is no danger of a tornado whirling them through the air to the damage of everything near; they can at any time be removed in a few moments. Some of the Tydæas were four feet tall and two feet in diameter, and masses of bloom. Senhor Olinda has all Van Houtte's best varieties, and the display is very fine. They are grown in very broad pans in vegetable mold, silver sand, and well-rotted manure, and, what is one secret of successful growth, they are never allowed to become dry. The only enemy they have is a small black bee, which bites the tube of the opening flower to get the honey, and thus causes it to fade quickly. Under a broad-roofed shed, close by, were many choice Marantas, Ferns, and other shade-loving plants, while on tables exposed to the hottest sun were Tillandsias and other Bromeliads.

Surely one's whole time must be occupied with the care of such a collection, in all some ten thousand plants! In another climate several gardeners would be needed for such a service; but in Para it is different. Senhor Olinda is obliged to be at his office in the city every day from nine to four o'clock, and no one but himself ever touches or waters a plant. The labor of potting and propagating, to one who understands it, is comparatively light, and the daily afternoon shower does most of the watering.

The Senhor told us that from December to August he had only twice been obliged to give a heavy general watering, but every plant is looked over morning and night. The labor of watering is greatest in October and November; but by a systematic grouping of the plants, it is reduced to a minimum, and all is accomplished in two hours, morning and night. To us it seemed the perfection of gardening—the maximum of pleasure and the minimum of labor; and as we turned our steps cityward, we thought that Para, with its perfect climate, is a Paradise for a lover of flowers.

E. S. RAND.

A HOUSE OF FLOWERS.

Roses and Lilies were wreathing the interior of an ideal London residence. In the entrance hall of this fine house, says a correspondent of the *London Globe*, the fireplace was hidden in pink Geraniums and grasses. The two fire-places in the dining-hall were respectively dressed, the one with Sunflowers and blue-ball Thistle on the chimney-piece, mixed with variegated Ferns and foliage and pink Roses at the base, the other with scarlet Gladioluses and white Hydrangeas; against the deep terra cotta of the walls they showed up splendidly. As one ascended the stairs, three huge balls of Roses, each about three feet in diameter, were hung by long pink ribbons, twined with a creeping plant from the balustrade at intervals; the lowest the darkest, the next a medium, and the top the lightest shade of pink. The large drawing-room had two alcoves. Opposite its entrance was a large mirror framed with Palms that rose out of a bank of pink Lilies, pink Heaths and Roses, interspersed with lovely leaves.

But the other alcove, the wonder of the whole affair, was literally a bower of Roses. Wire netting, covered close with these sweet blossoms and leaves, lined the interior, with the exception of a mirror. It was quite fairy-like. The chimney-piece and fire-place were arranged wholly with pink Gloxinias and variegated foliage, a delicate Cocoa Palm at each end serving as a frame.

The back drawing-room mantel-shelf was similarly arranged with pink Carnations, and that of the boudoir beyond was embowered in magnificent Lilies, Oleanders, pink Geraniums, and the lower part in glorious Roses with most exquisite greenery. The curtains throughout the rooms were all looped back by bands of Roses; in fact, it was a perfect "nocturne in pink," and culminated in the beautiful dress of the hostess, who wore a rich brocade white satin, trimmed with Roses and priceless lace, set off by a superb set of large, pear-shaped Russian emeralds hung from rivieres of diamonds.

A ROYAL FLOWER MISSION.

The Queen of Holland is the leading spirit of an enterprise which is well worthy of commendation and imitation. It is a society for the purpose of encouraging floriculture and horticulture among children, invalids, and aged people. Every year grain and flower seeds are distributed among these classes, and at the end of the season, prizes are awarded to those who have taken the most interest in their work, or have been the most successful. The members of such a society deserve to be known as philanthropists, for they benefit the world just as surely as the founders of insane asylums or charitable institutions.—*Prairie Farmer*.

ASPARAGUS IN POTS.

At the recent exhibition in Turin, Italy, a number of Asparagus forced in pots attracted considerable attention. The pots were comparatively small, and many contained each some twenty sprouts; in fact, they were crowded with them. With sufficient quantities of liquid manure, it would seem not more difficult to raise Asparagus in pots than fruit trees.

Rural Life.

SUBURBAN HOMES.

We have been particularly impressed with this subject the past few days, says Edgar Sanders, in the *Prairie Farmer*. It is interesting to note the difference there is, from a variety of causes, between what one man will do with a fifty-foot lot and what another will not do. To our thinking, for most village people in moderate circumstances, a fifty-foot lot by about one hundred and fifty feet deep will give all the room necessary to make a cozy, home-like place, and about all that most persons of the class we are thinking of can keep in good shape. This can be done with little or no expense, with a few hours' work each week, if rightly managed.

That locality is best where some attention has already been, or is likely to be, paid to a few of the preliminary necessities. For example, a building-line of not less than thirty or forty feet back from the fence is highly desirable, and it will be best if all the residents of the street conform to this, and also that lots all have a fifty-foot front. This gives space enough for the grass and the flower garden in front of the house, and at the sides to afford full light from all quarters.

For the front there is nothing more pleasing than close-shaven grass. Let there be a walk, not less than four feet wide,—and on no account other than straight,—from the fence to the steps. Another walk may reach from this, on one side or both sides of the house, to the back door. These are all the walks this part will require, except where the alleys are defective. In this case one not less than ten feet wide will be wanted so as to permit of keeping a horse or for hauling wood, coal, etc.

There is no necessity for exactly imitating one's neighbor in the management of this front; in fact, there are many reasons why, if each differs from the other, the most pleasing results to the general appearance of the street will follow. Some will prefer having little, if anything, but a close-shaven lawn, and if this be kept in perfect condition it is always a pleasure to look upon.

Another front which we have in our mind's eye is noted for its flower beds, one flanking each side of the walk, of irregular shape; another, toward the widest part, has two rustic vases in the center. There is also a rustic basket, nicely filled on each of the posts at the bottom of the steps; another is fastened on the rail at each opening between the posts of the piazza. There are climbing Roses at various points, but no shrubs in sight, save a bush of the charming Sweet-brier. This front really has a marked floral effect. Not every one would feel like spending twenty-five or fifty dollars every year to get this display. Still, if but one in a street does, it is a help.

Another resident combines profit with pleasure. He has several fine clumps of shrubs. The dividing-line on one side is a Lilac hedge; there are four Early Richmond Cherry-trees, which this year had not less than a bushel and a half of Cherries to the tree, and every year had sufficient for family use. Several quarts of Gooseberries were picked and preserved, and more than a

bushel of Currants. The flower garden is more limited,—only two beds,—the plants doing duty in the garden in summer and in the house in winter. A horse is kept at this place, and a little fancy poultry, the latter, of course, in a confined space. Then we know others who use all the back space as a vegetable garden, and claim that the fresh, crisp Lettuce, Radishes, Cucumbers, etc., are ample recompense for the little morning toil necessary to secure them.

We were this morning on one of these fifty-foot lots, in a more humble quarter, where the house is yet but a small cottage, planned for an addition when the ground is paid for, and found it a veritable kitchen garden. It contains Potatoes, Parsnips, Beets, Peas, Onions, Carrots, Cabbages, Tomatoes, Lettuce, Radishes, and even herbs of several sorts. This is the second summer it has been cultivated, and of course the soil of last year is now in excellent condition for growing good crops. The result is marvelous. The lot will furnish more of the freshest and best of vegetables than the family—man, wife, and five children—can consume during the summer. To show that utility is not altogether master, the straight walks are bordered on each side with flowers of the commoner kinds. Here, however, the lawn is dispensed with. The click of the croquet mallet, in some cases, tells that the back yard is converted into a play-ground.

As we remarked above, it is not desirable to aim at uniformity; indeed, with this the charm would be broken. Let the grounds, like the house, be varied to suit the owner's taste and purse. One will choose a cottage costing, it may be, only from one to three thousand dollars. Another, more pretentious, will now and then run up considerably into the thousands. But let there be neatness in everything, and by no means forget the public street in the front of the place. We are forced to admit that it is too common to see fairly kept inside grounds, with street-front entirely neglected. However well a lot may be kept, much of the beauty is lost to the passer-by if his eye rests on a part utterly out of harmony with that over the fence.

PIAZZAS AND PORCHES.

"A country house without a porch is like a man without an eyebrow: it gives expression, and expression where you want it most. The least office of a porch is that of affording protection against the rain-beat and the sun-beat. It is an interpreter of character; it humanizes bald walls and windows; it emphasizes architectural tone; it gives hint of hospitality; it is a hand stretched out (figuratively and lumberingly often) from the world within to the world without."

This saith the wise author of *Out of Town Places*. Similarly, a country house without a piazza—applying that term to any sheltered adjunct to the main walls of a house, not primarily intended to shelter or embellish the entrance door—may be likened unto a man without ears; it lacks breadth, the readiness and completeness of full equipment for all exigencies. To change the figure, it is like a man of selfish, reserved, ungenerous disposition, who cares for nobody, trusts nobody, invites nobody to share his joys and sorrows. Clearly, then, a house ought to have a piazza somewhere. But it

sometimes happens—in fact, it usually happens—that a broad side piazza, or a full-sized extension of the "front porch," will keep the light and sunshine from rooms inside the house which cannot afford to be deprived of these inalienable rights.

But "one corner" does in many cases suggest a circular piazza which, although having breadth and comeliness, still carefully respects the rights of the interior—by no means an invariable characteristic of the outside trimmings of men or houses.

The little sheltered inclosure is a different affair, evidently holding itself to be the head and front of the corner it occupies, although so modest in appearance. It is justifiable in our variable climate, as affording a middle ground between indoors and out, and should never be allowed to stand before the southern windows, though it may fill an unoccupied angle or rest against a blank space between windows widely separated.—*The Builder*.

THE COUNTRY-HOUSE HALL.

"It is to be hoped," says Ella R. Church, in *Godey's Lady's Book*, "that the entrance door of our country house has a wide, hospitable look; for this is a grace of expression that seems especially to pertain to a rural residence. We will therefore assume that it has; and trust to be ushered into a hall of corresponding dimensions, where the staircase does not thrust itself obtrusively forward, but retires modestly into the back-ground. When it is too far front, and especially if there is no vestibule, a tall screen of simple construction will shut it partially off.

"Shade without gloom, and a certain quaintness of character, are attractive in the country hall, which is too often a bare, glaring passage-way from one part of the house to another. The cutting off of angles is always an improvement; and some one recommends that the corners behind the front door be converted into bracket cupboards, as it can be done without much trouble or expense.

"A panel of wood is fitted across the corner, of a size proportioned to the width of the hall; it is rounded at the top, and an arched opening is sawn from the center. Over the arch a triangular shelf may support a bust or vase; while a similar one at the bottom will accommodate an umbrella-stand.

"A stained or painted floor, with a rug or a width of crimson carpet on the center, looks well in a country hall, and a table of some kind never seems out of place, whether on one side or in a corner. The hat-rack may be of simple construction, pine wood ebouized, and can be made by a village carpenter.

"An inexpensive bracket, placed rather high on the wall, at the foot of the stairs, to hold a receptacle for flowers, is a charming bit of ornament, and we know of one supporting a large white shell, from which a long swooping fringe of *Tradescantia* droops in perennial greenness, for it has taken root there, and is always ready to furnish a back and foreground for the flowers which find their way there in greater or lesser profusion, according to the season. Sometimes there is little or nothing besides the green sprays; but they are always beautiful, and seem doubly so when found in an unexpected place."

Exhibitions & Societies.

NEW-YORK HORTICULTURAL SOCIETY.

The October exhibition of this society was held at Horticultural Hall on the 7th ult. Several rare and valuable plants shown here for the first time made the occasion of more than usual interest.

Mr. J. H. Cockraft exhibited a rare and exquisitely beautiful Orchid under the name of *Cattleya aurea*, the correctness of which was doubted, however, by several specialists who pronounced it *C. Dowiana*. The color of its flowers is very different from all other species of the genus. The petals and sepals are of a peculiar yellowish-buff, while the lip is very deep amaranth-purple, velvety, appearing almost black when seen from some distance, and distinctly and sharply veined with golden yellow. The flowers were fully six inches in diameter and presented a really gorgeous sight.

A *Dracana Lindenii* exhibited by W. C. Wilson attracted deserved attention. The bright green leaves are broadly striped with light yellow, in marked contrast to the red-leaved species.

The collection of foliage plants exhibited by Siebrecht & Wadley was one of the leading and most attractive features. All the specimens were well grown and in healthy condition. Most notable among them were:

Anthurium Andreanum, *Curcuma Roeseana*, *Schismatoglossis Robeleni*, *Sphaerogyne latifolia*, *Dracana Bausei*, *amabilis*, *Goldiana terminalis*, *Adiantum decorum*, *Parleyense* and *formosum*, *Alocasia macrorrhiza*.

The largest exhibitors, as usual, were Hallock & Thorpe, filling about half of the table room in the hall. Their collection of single and double Dahlias, Gladiolus, Geraniums, Zinnias, and cut flowers deserved all the premiums that were showered upon them.

Several collections of Roses, Orchids, and other flowers and plants from various exhibitors we regret not to have had sufficient time to notice specially.

Prominent upon the Fruit table were several plants of the now white Grapo, Jessica, exhibited by J. T. Lovett; some very promising seedlings raised by F. Roenbeck; also seedlings from Chas. C. Copley, and some magnificent bunches of hot-house Grapes raised by Mr. J. M. Kellar.

Mr. Geo. Mathews made a creditable display of vegetables, comprising all the seasonable kinds to be found in a well-appointed garden.

The special Chrysanthemum exhibition, on account of the first Tuesday of the month being election day, will be held on Wednesday the 5th of November.

THE AMERICAN INSTITUTE.

Two special exhibitions of Plants, Flowers, and Fruits were held during the past month at the Hall of Industry, Third Avenue, Sixty-third and Sixty-fourth streets. The first opened on the 8th of October, continuing for four days, and attracting thousands of visitors. Several hundred entries were made, and in several classes competition was so close as to make the judges' task an arduous one. The most notable features were the general

excellence of the exhibits and the tasteful manner in which everything was arranged, giving the whole a most attractive and imposing appearance.

Among the principal exhibitors in the Plant department we noticed Hallock & Thorpe, W. C. Wilson, John Finn, James Buchanan, S. R. Shaw, and J. G. Bechamps & Son. W. C. Wilson's collection of hot-house plants comprised many valuable Palms, Crotons, Musas, Yuccas, Marantas, Anthuriums, etc., all in well-grown specimens. The large collection of Palms shown by John Finn attracted probably as marked attention as any exhibit in the hall. His specimen *Phoenix dactylifera*, *Lantana Borbonica*, and *Pandanus utilis*, with leaves spreading over five feet, were of remarkable beauty, and presented a grand sight. Hallock & Thorpe's collections of various plants covered an entire table running through one-half of the large hall; it was laden with many hundreds of rare and beautiful plants, and was constantly surrounded by an admiring crowd. A collection of twenty species of Selaginellas, the name of the exhibitor of which we could not learn, was highly interesting and meritorious.

In the Fruit department, Ellwanger & Barry, of Rochester, were deservedly awarded all the first prizes for best collections. They exhibited a collection of 112 varieties of Apples and 73 varieties of Pears, in addition to innumerable single plates, which to name would fill more than a page. T. S. Foreo, of Nowburg, showed, if not quite as large a number of varieties, remarkably fine and well-grown specimens. Daniel Van Alst, F. B. Kelly, and Wm. Ottman made also creditable exhibits.

E. and J. C. Williams, of Montclair, N. J., led the van in the Grape division, taking the first prizes for the best collection of ten, as well as that of five varieties, and also a large number for single plates. The new white Grape "Niagara," exhibited by this firm, attracted a great deal of attention; the heavy, full bunches measuring seven inches and more in length, and tastefully suspended from a small trellis, looked provokingly tempting.

C. C. Crosby, T. S. Foreo, C. J. Copley, A. J. Field, and others showed also fine bunches of various varieties. The only exhibit of foreign Grapes were two glorious bunches of Barbarossa, weighing together ten pounds, from Arthur Rich.

The Vegetable table presented a few collections of Potatoes, and the leading vegetables of the season.

A special Geranium show was held from the 15th to the 17th. Messrs. Hallock & Thorpe were, of course, the principal exhibitors, and were awarded most of the prizes. The efforts made by this firm, and the risk incurred in bringing so extensive a collection of valuable plants from so great a distance at this season, deserve high commendation, and probably few of those who enjoyed the sight of their magnificent exhibit can form an idea of the amount of labor and money expended in its production. John Farrel, gardener to William Barr, exhibited also a large collection of single plants, many of them of merit.

The Chrysanthemum show, announced to be held on October 29th has, on account of the lateness of the season, been postponed till November 12th.

Household Pets.

PETS AND CHILDREN.

The care of pets has a beneficial influence upon the health and character of children. In attending to them the time which most probably would be spent in idleness, or worse still, among bad associates, is occupied in healthful and instructive amusement. Children always learn about the habits, peculiarities, etc., of the animals which they keep as pets. And a very dull boy it is, who, having rabbits, will not eagerly read and remember everything he can find concerning them. "From little beginnings great ends are produced," and the love for nature's beauties has often sprung from the keeping of pets. Many great naturalists will say this.

I admit it is very inconvenient to have one's house filled with old bird-cages, squirrel and white mice boxes; the yard covered with rabbit hutches or bantam runs; the garret turned into a pigeon loft, or the choicest spot in the lawn occupied by a fish-pond. But we must remember our children's characters are now forming, and that it rests with us, in a good measure, whether they shall contract habits beneficial or injurious. We must keep in mind the fact that, habits formed in youth, good or bad, will cling to them throughout their future lives; and if we prevent our children from forming evil associates we do a good for them for which they will bless us in future years. And when your son rushes into the room with a rabbit under each arm, and a pair of white mice in each pocket, with eyes beaming with pride and love, and cheeks made rosy by exercise, and lays his pets before us for our approval, instead of greeting him with a cold glance and the pets with a look of disgust, pour words of encouragement into his ears, and kindly pat the little creatures, thanking God that it is not the wine bottle or the card pack with which he is so infatuated.

One bad habit in particular, incident to childhood, the care of pets will overcome; a habit which will have to be shaken off before they can enter on the stern duties of business life. I mean late rising, which, if allowed to get a firm hold, would deprive them of one-fourth of their worldly lives. If upon a son this habit has once fixed itself, buy a pair of rabbits, construct a hutch for them, and tell your boy if he will rise every morning at five o'clock and feed the rabbits they are his; if not, you know a boy who would be glad to do so. Most likely he will joyfully accede to your request. By degrees the habit of late rising will be conquered, and a new one grafted in its stead, worth to him many hundred pairs of rabbits.

Upon the health of sickly or delicate children the habit of early rising and caring for pets has a most salutary influence, and instilling in their minds many ideas of much moral worth.

The care for some living creature dependent upon a child for its wants, tends to develop some of the noblest traits of character.

Before allowing children to keep pets of any sort, it is better to exact from them a promise that they will be punctual in attending to the wants of the little animals placed so entirely in dependence on them for food and attention.—*Feathered World*.

Miscellaneous.

INDIAN SUMMER.

The roadside bright with wealth of bloom,
The soft air sweet with faint perfume,
The birds in ecstasy of tune;
"Ah! this is June, most perfect June,"
We cried, and plucked the flowers gay.
"O perfect June! O perfect day!"

The pathway led thro' forests deep
Where cattle browsed, meek-eyed sweep;
The Maples fired the gloom with bluze
And led us into untracked ways;
"Ah, this October is," we cried,
"October in full pomp and pride!"

The pathway wound a mountain steep
Where Gorse and Heather grew knee-deep;
The summit reached, a chill wind blow,
Cold seemed the overarching blue:
"November 'tis again, we cried;
"Farewell to thee, sweet summer-tide!"

Descending into valleys green
Where cattle browsed, meek-eyed, serene,
Where babbling sped the noisy brook,
And eager fishers baited hook:
"Tis Summer still!" we more cried we,
"O Indian summer, hail to thee!"

M. A. S. in Boston Journal.

FLORAL DECORATIONS AT HOME.

THE HALL.

It is never good taste to place in the corridor any but foliage plants, or cut Ferns, vines, evergreens, and the like. Flowers, whether on or off the bush, are more or less susceptible to draughts, which blight their petals and mar their perfection. It is inconsiderate and inharmonious to garland banisters with Roses, or place bouquets of rich blossoms on newel posts.

Let the former be bound with chains of shaded Ferns, and a specimen *Croton elegantissimus* surmount the latter. A corridor can be made fantastically bewitching with lacy Ferns and brilliant foliage. It may be dressed to represent a Fern lane for festival occasions, or rendered quietly beautiful with a few plants, or bunches of cut vines and foliage. A peaceful aspect is bestowed by verdant foliage, which is most refreshing, delightful, and suitable for the entrance to a house.

A charming bouquet for the hat-stand is one of Dogwood Ferns, *Adiantum tetraphyllum gracile*, which has a reddish cast to its young fronds, Elkhorn Ferns, and *Selaginellas*. If these are laid in a flat dish of water they will remain fresh many days. The dish will look more artistic if fringed with trailers. Smilax and *Ivygodium scandens* will last some time, but *Tradescantia* will grow thriftily in water. A simple flat basket planted with *Lycopodium* is very attractive in this position. All kinds of mosses and wood growth will ornament hall-stands; a bunch of autumn leaves is also very suitable and handsome.

THE DRAWING-ROOM.

All flowers become the drawing-room; the finer and the more choicely selected the varieties, the more elegant the decoration. Roses are the richest and dressiest of all blossoms; Orchids are exceptionally choice, and Lilies are the most effective. The tendency in parlor decorations is to everdo, and

to fill in positions high with coarse and inferior bloom.

The fashion of swinging nondescript designs between doors and over mirrors is born of poor taste. Flowers lose their effect when tied on sticks and woven into silly mottoed balls, knots, and arrows. Small flower glasses should contain but one long-stemmed Rose, a spike of Orchid, or a few Lilies.

Vases demand careful arrangement. Callas and *Euphorbia Japonica* combine well in these, but Callas are more effective with their own foliage simply, and should never, in our opinion, be in company with blossoms, unless related to their family. The same is applicable to *Lilium longiflorum*, *L. candidum*, or the gorgeous throated *Amaryllis*, which are maltreated when placed among a conglomeration of flowers. To see any flower in its entire beauty, its foliage must remain undisturbed.

The habit of snipping the leaves from stems and binding them close about the blossom is ridiculous, as the stem with its growth shares the glory with the flower. For this reason "cluster baskets," the thickly massed bouquet, any arrangement, in fact, of flowers where their foliage is stripped and they are tied to a stick is inartistic, and is usually a make-shift to utilize inferior blossoms. Limoges vases, decorated with floral devices, are handsome holders for Roses.

THE FIRE-PLACE.

As the fire-place is the center of attraction in any room, so the mantel above it is the place where the most artistic effects in floral decoration can be produced. When there is no fire fill the fire-place with pots of blooming plants. These may be sunk in baskets of moss with excellent appearance. Double Geraniums are beautiful for this purpose, especially when the trusses of bloom are at their maximum. A few Ferns should be intermixed.

To bank mantel-pieces seems an intricate piece of work, but it is not. The prettiest plan is to bed the mantel-piece with *Lycopodium*; it makes a cheaper and more effective foundation than massed blossoms. Lay first over the mantel-piece a coat of tin-foil. Cut strings of *Smilax* into a fringing to fall over the edge, and trim it evenly. Place this on the tin-foil; turn out the *Lycopodium* and put the contents of each pot firmly together until there is an even bed of it. Bond it down to fit the edge from which the *Smilax* fringing hangs. Vases of flowers may be set on this, or flat baskets filled loosely with Roses and spring flowers. Upon such a foundation most any effect may be brought out.

FLORA.

FLOWER CULTURE IN BOSTON.

Strangers in Boston during the summer season ever remark the loveliness of the Public Garden, an addition, yet quite distinct from the Common. It is a huge lawn, some twenty acres in extent, dotted with patches of bright-colored flowers, a single kind in a bed of oblong, round, square, or some eccentric shape. The effect of such coloring in the midst of a smooth, velvety lawn is very charming, from the contrast as well as the beauty of the blossoms. The whole atmosphere is pervaded with these sweets. A lake, an ornamental bridge, shrubbery, and great

shade trees at intervals along the winding pathways, make this spot an elysium.

As the season advances the flowers are changed, and so the place is ever harmonious in its beauty and purpose. All through the year flowers are hawked in the business streets of Boston at every hour of the day and evening. Great Roses, and Pansies, and Clove Pinks seem to take the lead in this street trade; while the florists' windows have an embarrassment of riches in the rarest and most costly flowers from their great conservatories.

In no city are flowers and foliage plants more extensively used for decorative purposes. The bordering of a table-cloth made of Roses for a dinner-party is not uncommon, or the ornamentation of the wall of a dining-room or a parlor with the choicest cuttings from a greenhouse. A pretty fashion in calling is the leaving of a bouquet with a visiting-card.

The Roses cultivated near Boston have long been accepted as the finest grown in this country. About five hundred are sent to New-York daily, and as many more in other directions. One florist grows nothing but Clove Pinks in his largest conservatories. Another cut ten thousand Violets in one day in a single greenhouse. The most famous Rose houses in the vicinity are those of Natiek, belonging to Mr. Wood, some twenty-two in number, each over one hundred feet in length by thirty-two in width, and all so connected with underground passages that the workmen can pass from one to another without going outdoors. The Roses are trained on wires and are exceedingly vigorous. The buds are cut every hour and carried to an ice-house lined with zinc, and having three air-chambers, until packed in air-tight boxes for the home market, or to be sent to New-York, Philadelphia, St. Louis, Chicago, Canada, and as far as Kansas City. In February there were seven thousand Marechal Neil Roses cut in one of these houses, and twenty thousand Jacqueminots in another, to say nothing of the thousands of Cornelia Cooks, Baroness Rethschilds, Catherine Mermets, and all the varieties of Roses that are so eagerly sought for at the present time. One house has Tea Roses alone. These Rose houses cover four acres, and require an army of workmen to take care of them.

The very height of floral culture of all varieties in the neighborhood of Boston is, however, reached in the famous "Hunnewell Gardens," or the "Italian Gardens," as they are popularly called. They are open to all who care to visit them. There are fifty acres under cultivation. One portion of the grounds runs down to a pretty lake called "Waban Mero," which is the fountain-head of the Charles River. The terraces are here ornamented with overgreens cut into fantastic shapes, that give an almost weird appearance to the place. Farther up the bank, on the lawn, are walled inclosures of evergreens, with winding paths in the short turf or beds of flowers. Arched openings give egress from those romantic and lovely rooms. One of them is so arranged that an awning can be drawn over it for social purposes, or the display of some rare show of flowers.

The conservatories, fruit and Grape houses are marvels of their kind. In one house are one thousand rare Orchids, from every country where Orchids grow, and they hang in

fantastic grouping from the glass roof, the side of a board, or some other unexpected situation. Figs, Nectarines, Grapes, and Peaches tempt one to pluck them while en route through this tour of the glass houses. The foliage plants are a wonder, as well as the Azaleas, of which there are many varieties.

The house conservatory is admirable for its arrangement. It is a room high and wide, and paved with marble, and having a plate-glass front toward the home mansion. Here the choicest of the blossoming exotics, the Roses, in short, everything that is best from the greenhouses, is arranged to delight the eye of the owners of the estate, from time to time, as they come to perfection. It is difficult to imagine anything finer of this description. In June the Azaleas are placed on the lawn under a canvas cover, and later the Rhododendrons in the same fashion, to the admiration of all who go to see them.

As these gardens are contiguous to Wellesley College, the students of that institution have the rare privilege of rowing across the "Mere," and enjoying the sight of this culture of flowers.

The famous Baker gardens, near the Hunnewell estate, are not so extensive, but have unique features. In Cambridge are some gardens of rare beauty, and a public botanical garden of considerable excellence. The flowers and plants from this last-named garden and its conservatories are used by the classes in botany of both the Harvard University and the Harvard Annex for women.

Indeed, it is difficult, if not impossible, to leave Boston in almost any direction without finding evidences of the unusual admiration and care given to horticulture in its vicinity.—Mrs. Ella Dickinson, in the Churchman.

WOOD FLOUR.

A letter from the Catskills to the New-York Sun says: The chief industry up here is producing wood flour, a kind of cousin to wood pulp. It was first manufactured in the Catskills about nine years ago, and now over twenty mills are in full blast. The process is exceedingly simple. Any soft-wood tree—Poplar is the favorite—is felled and drawn to the mill. The bark and boughs are removed, and the trunk put in a machine which is nothing but a lead-pencil sharpener on a large scale, with four or more knife-edges instead of one. On starting the machine, the pencil sharpener revolves with great swiftness, and in a few minutes converts the log into a hundred miles of fine, clean shavings. These are ground and bolted exactly as in a flour mill. The product is a soft, fine, yellowish white flour, similar in appearance to very well-ground Corn-meal. It possesses a slight woody smell, and is almost tasteless. It is put up in large bags, and then is dispatched, unmarked, to the buyers.

I tried to find out who purchased the article, but with no success. The wood miller was not very communicative. "It makes,"—he said,—“well, I don't know how much exactly. One log may give five bags, or it may give ten. It sells—well, that is, pretty tolerable. I reckon I clear about \$8 or \$9 a day out of it—perhaps more. I never figured it up. What's it good for? Good for many things. It's used to stiffen paper; but if you put in too much, the paper

gets brittle. Paper stock is much dearer than Poplar flour, and that's why they put it in. If you mix the flour with linseed gum and 'biled' oil, you may get a kind of oil-cloth. Some folks mix it with meal to give to pigs and other animals. I guess it's good, but I never give it to my hogs; and even those fellows give it to some other fellows' critters, and not their own. Yes, I heard that some bad contractors mixed it with meal for army and Indian supplies, but I don't take much stock in the story, because they could buy sour meal as cheap as Poplar flour. It wouldn't pay to mill Pine, Cedar, or Hemlock; they are worth too much as timber. But any wood that isn't used that way can be milled into flour. I use Poplar almost altogether, but when I run short of logs I grind up Buttonball, Birch, Elm, or Willow."

The farmers dislike the new industry, as it promises to play havoc with the forests, which are both an attraction to the boarder and a protection to agriculture. The tanneries years ago used up all the Oak and Hemlock; the lumbermen have stripped the country practically of Pine, Cedar, and Walnut; the chair factories are consuming the Hickory and Maple; now the wood-flour mill promises to grind up what remaining trees there may be.

ELECTRIC BOUQUETS.

The latest novelty in bouquets—newer even than pink Water-lilies or blue Hydrangeas—was carried by the Princess of Wales at a ball after the races at Goodwood. It was of Roses, and in the middle of it was concealed a miniature electric lamp, the light from which could be turned on at will by means of a little switch in the form of a lady's brooch. Gentlemen's boutonnières are also so arranged as to contain an electric light.

"These, if they come generally in use," suggests the *Prairie Farmer*, "will deal a death-blow to flirtations in dark places, as a passing friend has but to turn on his battery, and lo! forms and features are revealed with uncompromising distinctness. Paterfamilias will probably be a willing patron of the electric boutonnières, as he can thus not only follow up and drive away ineligible and detrimental, but can collect his scattered forces as the small hours approach and gather them under his wings preparatory to departure."

VEGETATION ON COINS AND BANK-NOTES.

Recent researches of Paul Reinsch, in Erlangen, Germany, have revealed the occurrence of different Bacteria and minute Algae on the surfaces of coins and bank-bills. By long circulation, coins become partly incrustated with a thin film of organic detritus, composed principally of starch-grains and fibers, which furnish favorable conditions for this microvegetation. On the surface of paper money, even of notes which appear perfectly clean to the naked eye, are always to be found the special Bacteria of putrefaction (*Bacterium Termo*); while on those that have been long in use various microscopic plants are found in full vegetation, thus furnishing a ready explanation of how diseases are sometimes transmitted through money.

OUR BOOK TABLE.

The Hearthstone, Farm, and Nation is the title of a new Monthly, a Journal for Domestic and Rural Economy, Agriculture, Horticulture, Live Stock, Current Events, Education, etc., published by W. H. Thompson & Co., Philadelphia. The initial number contains a rich store of useful and entertaining information, carefully and ably edited, well printed on good paper, and is altogether as near the ideal rural family paper as any publication that comes to our table.

Outing.—The November number of *Outing* brings the magazine into new prominence in the added space given to yachting matters. This form of outdoor pleasure is represented in several articles of unusual interest, by a full record of nautical events. "A Scamper in the Nor'-West," by J. A. Fraser, profusely illustrated by the author, is the leading article, and gives the reader some fascinating glimpses of the shores of the "big sea-water" of Superior. Another capital illustrated paper is "Wheeling among the Aztecs," by Sylvester Baxter. This gives some delightful glimpses of the ancient city of Mexico and the pleasant environs that tempt the wheelman to his steed. The editorial department discusses "Art and the Bicycle," and "Physical Education in College," among other topics of the hour. The price of *Outing* is \$2.00 a year. The Wheelman Co., Publishers, Boston, Mass.

Three Visits to America. By Emily Faithfull. 12mo, pp. xii, 400. Cloth. Price, \$1.50. Published by Fowler & Wells Co., 753 Broadway, New-York. The author of this volume needs no introduction to an American public; her work in behalf of struggling women during the past twenty years has been attended with so much success that she has acquired wide-spread celebrity. Her three visits in this country were made for the purpose of studying our society, our industrial methods and organizations in behalf of poor and unfortunate English women, and the record of these three visits is not a rush into print to gratify personal motives merely, or to let the world know "my impressions of America," after the style of so many foreign tourists, but the notes of a warm-hearted, practical observer who is in earnest for the improvement of the condition of her fellow-women, and gives her best experience in the tracings of her pen. Few writers on America have seen so much of our country, talked with so many of our best people, and looked so deeply into our social habits and institutions; and as she relates the notable incidents of her journeys in a lively, agreeable manner, showing everywhere the woman of exuberant good nature, the reader is captivated at the start. Sketches of conversations occur all through the book, most of them with well-known people, all of whom cordially aided Miss Faithfull toward the attainment of her mission. But what will most interest the American reader are the chatty comparisons made of our social mannerisms with those of old England, and the tendencies that she thinks are clearly to be seen in popular sentiment as concerns trade, government, labor, the woman question, and so on. The eminent utility of what Miss Faithfull says here and there makes the book valuable; while it will entertain every one who takes it up, it will be sure to instruct those who are thoughtful.

N. W. Ayer & Son's American Newspaper Annual for 1884 contains a carefully prepared list of all newspapers and periodicals in the United States and Canada, arranged by States in geographical sections, and by towns in alphabetical order. In this list also is given the name of the paper, the issue, general characteristics, year of establishment, size, circulation, and advertising rates for ten lines one month. Then follows a list of all newspapers inserting advertisements, arranged in States by counties, with the distinctive features and circulation of each paper. Also complete lists of all the religious or agricultural periodicals, of medical, commercial, scientific, educational, or any other of the class publications, can be obtained from it. It will show you at a glance all the newspapers published in any one county in the United States and Canada. It gives the location, county-seat, and population of every county in the United States, the character of the surface, the nature of the soil, and its

adaptability to the growth of the various agricultural staples, of every State, territory, and county in the United States, and of each of the Canadian provinces.

In it is given the population of every State, territory, county, and county-seat; of all the large cities and towns, and of almost every place in which a newspaper is published; also the colored population, by counties, in the Southern and South-western States, and the Chinese population on the Pacific Slope. It also gives the political majority of every State, territory, and county. It has a list of the cities, towns, and villages of the United States having a population of five thousand and upward, arranged in alphabetical order.

It is unequalled for fullness, correctness, compactness of statement, variety and value of contents, and freedom from favoritism or prejudice. Price, \$3.00, carriage paid.

New-York Agricultural Experiment Station.—Report for the year 1883. This, the second annual report of Director Dr. E. L. Sturtevant, gives a still clearer insight into the scope and amount of work carried on at the Station than the previous one. Some of the results of the year's work have already been made known to our readers through the Station Bulletins, from which we have given frequent quotations. These weekly bulletins, issued by the director, are of inestimable value to the farmers of the State, and the entire country in fact, not only in giving accounts of the latest discoveries and investigations, but because they are distributed in so judicious a manner as to reach the largest possible number of readers. A million of volumes could not accomplish nearly the amount of good these little, unpretending Weekly Bulletins do. Let us have the Annual Reports for reference in our libraries; but for the most extensive distribution of knowledge, and for effective, practical work, give us the Bulletins.

One of the most formidable difficulties which confront the director, as well as agricultural experimenters generally, is to make farmers understand that the object of experimental work is not to raise the best and largest crops—market gardeners do this—but to discover the why and whereof, to verify and to disseminate.

"Agriculture in its practice," says the doctor, "is a complex art; it deals with factors of varied character and great divergency. Under the concrete terms of seed, soil, fertility, climate, protection, etc., we express the combined results of also varied and divergent factors. Were it possible to give expression to the values of each and all of these factors, not only by themselves, but in their relations, then we could hope to have an exact science, admitting of definite expression, admitting of verification, admitting of duplication in experimental trials. It seems to me that a thoughtful consideration of the principles involved in this idea must give hope that progress can be made, and that sooner or later the results of a careful study into the principles and relations governing agricultural pursuits will enable tables of constants to be established which shall avail to interpret for us the discrepancies now so familiar to practice, and will enable us to secure with accuracy the results for which we may plan. If a practice be claimed as successful, then should we be able by trial to verify its claims, eliminating the effect of local conditions, and getting an understanding of the truth or falsity of the principles upon which the claim may be founded."

The plat system of experimenting generally adopted by experimenters everywhere was, at the station, found more apt to afford incorrect than correct conclusions, caused by lack of uniformity of character in the seed used, differences in the number of plants which survive and attain maturity, and in differences in the soil of the various plats.

"A close acquaintance with the difficulties that beset our path," says the director in regard to this, "leads us to the candid admission that the most important portion of our work is the learning how to experiment, and how to interpret our results. We must expect to find much of our labor thrown away upon efforts which shall not yield an adequate return, and we must expect our path to be marked with failures, saddening at the time, but from which lessons may be derived for future progress. Indeed, in well-directed ex-

perimental trials, failures may be even considered at times of advantage, as teaching lessons which might not otherwise be learned.

"The leading aim of an experimental station such as ours must be by experimental study of the most careful kind to obtain knowledge of the action of the laws which find application in agriculture, and to devise methods for the application of the knowledge gained in order that in practical farming waste of means and effort may be diminished, and gain may be increased, and thus profits be forwarded."

The report of the horticulturist, Mr. E. S. Goff, shows that a conspicuous and important part of the garden work, the past season, has been the careful test of varieties. Seeds were planted of almost the entire list of garden plants offered by our American seedsmen, as well as many others from foreign countries. In this work were had other objects in view than the mere comparison of yields and qualities. All who have made the least study of varieties in vegetables know that there is much confusion in nomenclature. It was endeavored, as far as possible, to discover how many of the so-called varieties planted are really distinct, and how many are only synonyms. It was also desired to study the fixity of varieties, the trueness to which seeds reproduce to name and the variation, which are apt to occur.

The special reports show the period required for the germination of each variety, the percentage of vegetation, yield, and general characteristics. The extent of this work may be imagined when it is stated that of Beans alone two hundred and fifty varieties were grown.

So far the Station work has exceeded all reasonable expectations, and we feel pretty sure that the State of New-York has never appropriated money to better advantage than when it founded its Experiment Station.

CATALOGUES RECEIVED.

John S. Collins, Moorstown, N. J.—Catalogue of Strawberry, Raspberry, Blackberry, and other Small Fruit plants, Grapes, Fruit-trees, etc. A very complete list of all standard kinds, with descriptions and illustrations of the leading novelties, most prominent among which are May King Strawberry, Early Cluster Blackberry, and Comet Pear.

Thomas W. Weathered, 46 Marion street, New-York.—Catalogue of Hot-water Boilers, and everything necessary for Heating and Ventilating Greenhouses. This elegantly gotten up and richly illustrated pamphlet gives, in addition to descriptions of the different patterns and styles of the justly celebrated heating and ventilating apparatus manufactured by this firm, a large amount of useful information about heating and ventilating greenhouses in general, of interest and value to every owner of a greenhouse.

ANSWERS TO CORRESPONDENTS.

Achimenes and Gloxinias.—S. E.—The bulbs of these and other gesneraceous plants should be planted in pots very early in spring, in the month of March or sooner even. Full descriptions and directions for their culture were given in our June number of the current year.

Datura arborum.—H. F. W., Huntington, Ind.—This plant, whose proper botanical name is *Brugmansia suaveolens*, is a native of Peru. It has been in cultivation a long time, but is not as frequently met with as it deserves. It will not stand our winters outdoors, and has to be taken up at the approach of frost, planted in a sufficiently large box or tub, and stored in a frost-proof cellar, giving it not more water than is required to keep its roots from shrivelling. In rich soil it will grow ten to twelve feet high. It is easily propagated from stem or root cuttings.

Lilies and Dutch Bulbs.—H. H., Fort Wayne, Ind.—It is not advisable to plant Lilies and spring flowering bulbs together in the same bed, for other reason, for this, that when removed he comes necessary they cannot be dug up the same without injuring one or the other. The object of having a continuous bloom may be more easily obtained by planting some shallow rooting plants between the rows of bulbs after blooming.

Verbenas are specially adapted for this purpose, or Portulacas may be sown even before the end of the flowering season of the bulbs, and produce a glorious mass of flowers all summer without injuring the bulbs in the least.

Asparagus.—R. S., Putnam Co., N. Y.—Asparagus roots may be planted now or in spring; in either case the ground should be liberally enriched before planting. One hundred plants well cared for will yield enough for a family of four or five. Plants older than two years are not desirable, and unless two-year-old roots have had sufficient room while growing, we would prefer good, strong one-year-old ones. If planted in the fall, a light covering of coarse stable manure during winter will prove beneficial.

Eucharis.—J. J., Parry Sound, Ont.—This is a hot-house plant, belonging to the Amaryllis family, and requiring during its growing season a temperature of not less than 70° in day-time, and not less than 60° during night, with plenty of water and full sunshine. It may be potted at any time. The soil most suitable for its growth is a compost consisting of about equal parts of loam, leaf mold, sand, and well-decomposed manure. After blooming, they should be kept in a lower temperature and receive less water, but sufficient to prevent their drying off entirely, which should never be allowed. During the summer months they may be placed outdoors to advantage. For fuller directions, see May number of this year.

Propagating Dahlias.—R. O., Delaware, Ont.—The clumps may be divided in spring as soon as the buds appear; they may then be separated into as many pieces as there are eyes with a tuber to each. When large quantities are required they are propagated by cuttings. About February the clumps are placed in a warm greenhouse or hot-bed, to be forced into growth, and as soon as the shoots have grown two or three inches in length they are cut off at the base, potted singly in very small pots, and placed in a hot-bed. Where there is a propagating bench they may be planted in this, the same as other soft-wood cuttings. As they grow they have to be shifted into larger pots, and in May, after danger of frost is over, they are to be transferred to the open ground.

Hammond's Slug-Shot and Paint Works, located for the past ten years at Mount Kisco, N. Y., are about to be removed to Fishkill on the Hudson, as the constantly increasing demand for the goods manufactured by this firm requires more extended facilities than an inland village affords. We are glad to notice this indication of success, which, having ourselves used large quantities of the manufactures of this firm, we know to be fully deserved.

Ladies' Art Association.—Mr. Anthony Hochstein, the well-known artist of this city, teaches on Saturday afternoons at the rooms of this excellent society, No. 4 West Fourteenth street. His instruction is specially adapted to the higher education of those who are already teaching in schools and seminaries, as well as to those who wish to draw on wood for book illustrations. To those desiring to perfect themselves in the arts this offers a rare opportunity, as in the delineation and portraiture of flowers, plants, and natural objects generally Mr. Hochstein has few, if any, superiors in this country.

Twenty-five Hundred Meat-choppers are manufactured every week by the *Enterprise Manufacturing Company of Philadelphia*, whose advertisement appears on the outside cover-page. This will not surprise any one who has ever used this excellent machine. Of all the labor-saving implements used in our kitchen this bears the palm. For chopping up meat of any kind and degree of tenderness or toughness, as the case may be, a more effective and complete contrivance cannot be imagined. It is worked easily and rapidly, is readily cleaned, and withal is so simple in construction and so durably made as not to get out of order under decent treatment. It is a gem.

Patterns of your own selection, and of any size, given with every number of *Domestic Monthly*. See advertisement.

PATTERNS OF ANY SIZE. UNPARALLELED OFFER! DEMOREST'S THE BEST Of all the Magazines.

Illustrated with Original Steel Engravings, Photogravures and Oil Pictures. Commencing with November, 1884, each Magazine will contain a Copy of an Order, entitling the holder to the selection of ANY PATTERN illustrated in that number, and in ANY SIZE. Send twenty cents for the current number with Pattern Coupon and you will certainly subscribe Two Dollars for a year and get ten times its value. W. Jennings Demorest, Publisher, 17 E. 14th St., New York. Sold by all Newsdealers and Postmasters.

EVERY LADY

Interested in Art Needle-work, Fancy Work, and every branch of amateur Art Floriculture, Fashion, Cookery, or Music should send 15 cents for the current number Strawbridge & Clothier's Quarterly, 120 pages, 4 pages new and, and over 1000 engravings each number. Address STRAWBRIDGE & CLOTHIER, Eighth and Market Sts. Philada.

Our Autumn Catalogue, containing 72 pages, beautifully illustrated, will be mailed to all applicants for 10 cents. If you send us an order for Bulbs amounting to FIVE DOLLARS or over, we will present you with a subscription to the AMERICAN GARDEN for one year.

NEW EARLY RHUBARB—"PARAGON."

B. K. BLISS & SONS, 34 Barclay St. New-York.

WHAT EVERY ONE SHOULD KNOW!

A cyclopaedia of Practical Information, containing complete directions for making and doing over 5000 things necessary in Business, the Trades, the Shop, the Home, the Farm, and the Kitchen, viz.: Recipes, Prescriptions, Manufacturing Processes, Trade Secrets, Chemical Preparations, Mechanical Appliances, Aid to Injured, Business Information, Law, Home Decorations, Art Work, Fancy Work, Agriculture, Fruit Culture, Stock Raising, and hundreds of other useful hints and helps. This book tells how to make and do everything needed in our daily wants. A very useful book for reference to all. Handsomely bound in cloth. **512 Pages.**

A Few of the Many Things this Book Contains:

It gives Recipes for Liniments, Balsams, Balm of Gilead, Bitters, Syrups, Wines, Brandies, Harness and Boot Blackings, Blood Purifiers, Camphor Tablets, Cements, Cherry Pectoral, Cholera Mixture, Cholagogue, Cleaning Compounds, Cordials, Cough Cures, Croup Remedies, Dentifrice, Doplatories, Diarrhoea Remedies, Diuretic Tincture, Dysentery Cordial, Dyspepsia Remedy, Eye Lotions, Felon Cures, Fever and Ague Cures, and many others.

It Gives Medical Prescriptions for Abscesses, Acid Stomach, Ague Cure, Asthma, Bad Head, Bad Breath, Bad Sores, Biliousness, Bites and Stings, Black Tongue, Nose Bleeding, Wounds, Blisters, Bolls, Bots, Bruises, Burns and Scalds, Cancer, Catarrh Tonics, Chapped Hands, Chicken-Pox, Chillsblains, Cholera, Colic, Colic, Consumption, Convolusions, Corns, Costiveness, Whooping Cough, Croup, Dandruff, Deafness, and many others.

It Tells How to Make Harps, Attar of Roses, Baking Powders, Barometers, Baby Baskets, Axle Grease, Beer, Bengal Lights, Bureaus, Candles, Candles, Carpets, Castor Oil, Chewing Gum, Cologne, Copying Paper, Court Plaster, Mantel Ornaments, Curtains, Essences, Fire Kindlers, Fruit Extracts, and many others.

It Tells How to Clean Alabaster, Blankets, Copper, Brass, Silverware, Britannia, Crockery, Carpets, Ceilings, Chamois Skins, Chandlerys, Glass Chimneys, Clocks, Coral, Decanters, Engravers, Gilt Frames, Furniture, Furs, Gilt Cornices, Gnuis, Kulfes, Glass, Marble, Mica, etc., etc.

It Tells How to Destroy Ants, Grubs, Cock-roaches, Flies, Insects, Mosquitoes, Moths, Odors, etc., etc.

Price 80 cents, post-paid.

B. K. BLISS & SONS, 34 Barclay Street, New-York.

HYACINTH GLASSES.

As the season has now arrived when it is advisable to lay in your supply of bulbs for house and garden culture, it is proper to anticipate your necessities by purchasing glasses in which to grow Hyacinths, Tulips, or Crocus in water. We have a large supply of elegant patterns to which we wish to attract your kind attention. Among the many styles we offer

are included:

No. 1 (see illustration), a beautiful light-colored glass painted with various graceful designs; 50 cents each; \$5.00 per dozen.

No. 10, a forcing glass of clear flint; very long, allowing the roots full growth. Price very low; 10 cents each; \$1.00 per dozen.

Hyacinth glasses cannot be mailed. For a more complete list see our Bath Catalogue, just issued.

NEW EARLY RHUBARB—"PARAGON."

This variety, although now offered for the first time in this country, has had extensive trial in England, and has more than verified the claims made for it. It is unquestionably one of the finest varieties of Rhubarb ever offered, being the earliest of all and wonderfully prolific. The crowns and stalks are produced in such profusion that more than twice the weight can be gathered from "PARAGON" than from any other sort. It has also the qualification over all others that it NEVER SEEDS, a claim that we have tested and found well sustained last summer. The leaves are remarkably small, while in color the stalks are a beautiful bright red, and in flavor unsurpassed. Price, strong plants, 50 cents each, by mail, post-paid; six for \$2.50, postage 25 cents extra; twelve, \$4.00, postage, 50 cents extra.

**GRATEFUL-COMFORTING.
EPPS'S COCOA**

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution weakly and gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack where-ever there is a weak point. We may escape many a fatal snuff by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Chit Serice Gazette.*

Made simply with boiling water or milk. Sold only in half-pound tins by Grocers, labeled thus:
**JAMES EPPS & CO., Homoeopathic Chemists,
London, England.**

**THE
CHICKERING PIANO**

Established 1823.

Over 68,000 Pianos Made and Sold.

STYLE No. 20. GRAND.

Exceeds all other Pianos of American manufacture in its various patented improvements. The new designs in Chickering Grands, assuring larger results in power and purity, length and sweetness of tone, leave nothing to be desired. The Chickering Square Pianos, in all the usual styles, are unrivaled. The new Chickering Upright has the justly celebrated patented metallic action, which forever prevents the possibility of atmospheric interference with the action of the instrument, and adapts it for use in any climate.

Every Piano made and sold by
CHICKERING & SONS
is warranted for five years.

THE BEST WASHER

Find the best markets in the world right at their doors. Blizzards and tornadoes do not devastate their crops and ruin their homes. I have for Sale. Easy payment; long time; low rate of interest.
O. M. BARNES, Lansing, Mich.

We will guarantee the "LOVELL" WASHER to do better work and do it easier and in less time than any other machine in the world. Warranted five years, and if it don't wash the clothes clean without rubbing, we will refund the money.

AGENTS WANTED in every county. We CAN SHOW PROOF that Agents are making from \$75 to \$150 per month. Farmers make \$200 to \$500 during the winter. Ladies have great success selling this Washer. Retail price only \$5. Sample to those desiring an agency \$2. Also the Celebrated KEYSTONE WRINGERS at manufacturers' lowest price. We invite the strictest investigation. Send your address on a postal card for further particulars.

LOVELL WASHER CO., ERIE, PA.

The World's Electro Radiant MAGIC LANTERN

The body of the Electro Radiant is a coneshaped reflector which gathers each divergent ray of light and concentrates it from all on the main reflector, whence the whole mass of brilliancy illuminates and projects the picture with startling clearness. No combination of lenses, however ingenious, has ever been known to produce equal effects with the light used. The cost of an outfit to enable you to do a profitable business is small compared with the amount of money it takes to do any other business. Any one of ordinary intelligence can operate it, and \$10 to \$50 per night can be earned by giving Parlor, Sunday School, Academy or Public entertainments. For Public Entertainments, the possessor of an Electro Radiant has something that will "draw" with the combined power of the Theatre, the Circus, the Presidential Fair, the Country Fair, the Temperance Crusade, and the Camp Meeting. A room that will hold 100 persons may be filled nightly and a good profit be cleared. You have only to tack the sheet to the wall, darken the room, place the lantern on stand, light lamp, and you are ready to begin the exhibition. The Electro Radiant projects on the screen a Picture eight feet in diameter. \$10,000 were paid for the use of our Patent by Railroad Companies for Locomotive Headlights. It being considered the most wonderful light ever produced for the purpose. We have retained the exclusive right to make the Electro Radiant on the same principle, and it is the result of the adjustment of Rods, Lenses, Tubes, Slides, Rese and Cones are made with mathematical nicety. Optical laws governing such adjustments have been accurately calculated, so that you

\$25 LANTERN For \$12

PATENTED Perfection at the LOWEST PRICE

have in our Lanterns for more than appears, and we are prepared within the reach of all, unparagoned advantages for Learning, Amusement and Profit. The most interesting and profitable subjects from both the old and New Testaments, Temperance—Showing the folly and misery of the drunkard. Act—Miscellaneous Statues, Ban-reliefs, and Engravings, Steamboat Races, Port Snappers, Daylight, Scuba, Moonlight, etc. History—Landing of Columbus, Declaration of Independence, Yankoo Doodle, etc. Comic—Slide at will without number. You can add to your entertainment any time. Lantern with white complete in hand.—The next box, may be easily carried in hand.—The Electro Radiant No. 2 shown in our press slides and fittings complete will be sent by express on receipt of \$12.00 or C. O. D. in \$3.00 in suit with order, purchaser paying the balance \$9.00 on express office. Full instructions and list of other views sent with each slide and fitting complete will be sent all orders to
World Man'g Co. 122 Nassau Street, New York

\$10 to \$50 easily made EVERY NIGHT.

This Lantern can be made very profitable at Church Fairs, Sunday School and other entertainments, and a large amount of cash realized at a very small outlay.

NEW-YORK, DECEMBER, 1884.

No. 12.

MERRY CHRISTMAS TO ALL.

With each succeeding year our holidays assume more of a national character, obliterating sectional customs and usages, thus making us more akin in sympathy and interests, drawing firmer the common bond of brother and sisterhood, and uniting us more and more into one nation, one people. There was a time, and not long ago, when Christmas was unobserved and hardly known throughout New England, business being carried on on this as on any other week-day. Instead of this, another day was set apart for family gatherings and general merry-making, and called Thanksgiving Day. In this New England's forefathers "built better than they knew."

Thanksgiving Day is no longer merely a Puritan local institution, no longer a State holiday only, no longer unknown, in the remotest corner even of our vast national domain. And while now the entire nation observes this great holiday instituted by the Puritans, they have themselves reinstated old Christmas, and are celebrating and enjoying it with as much zest as was ever put into it in Old England. The fact that we do not have more such holidays is only to be regretted; if we had one every month we would all be the better and happier for it. As it is, we must concentrate our holiday moods upon the few we have, put our whole heart into them, and celebrate them with all the good-nature that is within us.

Christmas is preëminently the children's holiday. What glorious memories cluster around that hallowed day that transport childhood to fairyland! And while to the young it is freighted with the most delightful visions their imaginative minds can conceive, in those of maturer years it revives youthful joys and pleasures, makes the whole world buoyant, young, and bright again.

How fortunate it is that the occurrence of this sublime day falls just in midwinter, when without everything is drear and cold and desolate, so that the contrast of the

cheerful fire on the hearth, the bright green-eries on the walls, the brilliant glitter of the Christmas-tree may be the more appreciated, and reflect their warmth and cheer upon our own minds and hearts. A Christmas in mid-summer amidst green fields and blooming gardens and under the depressing influences of summer heat would be deprived of its

Santa Claus fills the stockings from his boundless bag, to another Kriss Kringle, with his swift reindeers speeding over forests and house-tops, brings his treasured gifts, and to another the lovely Christ Child makes a present of a brilliantly lighted and adorned Pine-tree, laden with gifts, America is gradually developing a Christmas observance of its own. We have already adopted some of the most beautiful customs and observances of several European nations, and amalgamated them with the all-pervading spirit of Christianity, making it a day of heart-gladdening, of charity, of love for all; for the rich to be made joyful and charitable by giving, for the poor to be made happy and thankful by receiving. On this day differences of rank and position, of wealth and poverty, are made to give way to our better selves, to a fellow-feeling for all mankind, that lifts us above our every-day routine of life into purer and better realms. To all alike the Christmas bells announce that the world is far better, far more beautiful, than moments of gloom may have made us believe; and while the carols may be old and familiar—so sublimely beautifully expressed in Longfellow's immortal lines—the kindly feeling, the charity, the love, the life they bring with them are always young and joyous to all who will open their hearts to their sweet, harmonious sounds:

"I heard the bells on Christmas day,
Their old, familiar carols play,
And wild and sweet
The words repeat
Of peace on earth, good-will to men."

BRINGING HOME THE CHRISTMAS-TREE.

greatest charms. "Bringing home the Christmas-tree," so beautifully represented in our illustration, is inseparable from snow and winter weather.

The forms of observing Christmas vary greatly among different peoples, according to custom and their ideas how to impress the child's mind most effectively. While to one

The Vegetable Garden.

SEASONABLE HINTS.

Spreading Manure in Winter.—While, for most garden crops, decomposed and finely broken up fertilizers are preferable to coarse, raw material, fresh stable manure is much better than no fertilizer at all, especially when applied during winter. The wastes from manure spread and exposed on the surface of the ground during winter are generally much overestimated; and we feel inclined to think that the losses from fermentation in the compost heap are not less than these from evaporation when spread over the field.

Fresh stable manure contains but very little ammonia—its only fertilizing ingredient that can become lost by evaporation—and the low temperature of winter is not favorable to its formation. The greater part of its nitrogen will, therefore, be transformed into nitrates, which become readily absorbed by the soil.

The danger of fertilizing matter being washed away on sloping land is likewise very small. We have frequently noticed, on hillsides of considerable inclination even, where large manure heaps have been piled up during winter to be spread before the plow in spring, that the effect of the manure could not be noticed in the growing crops for more than a few feet from the heap in either direction.

Many a farm garden, if it is to receive an allowance of manure at all, must secure it during winter, when men and teams have more leisure than in spring. In all such cases we would strongly impress upon the manager of the family garden that the wisest policy to pursue is to take all that can be had now. If possible, the ground should be plowed first, but not harrowed, and then the fresh manure spread evenly over it—the thicker the better. Most of its fertility will soak into the ground before spring, and the coarser part that remains on the surface is to be plowed or spaded under lightly next spring.

Plowing the garden in narrow lands with deep, open, dead furrows between them, running with the slope of the land, will not only leave the soil in finer and mellowed condition in spring, but admits of its earlier working. On cold, heavy ground this is of special importance, and makes often a difference of from one to two weeks in the earliness of the first crops. The dead furrows have to be examined occasionally after heavy rains during winter, and cleaned out if clods should impede the free current of the surface water.

Asparagus Beds should now receive a good covering of stable manure; it is immaterial whether the ground is frozen or not. If the roots are not deep enough below the surface for the crowns to be secure from injury in cutting the stalks, this is a favorable season for earthing additional soil on them. Asparagus roots planted deep, in well-enriched soil, do not only produce more delicately flavored stalks, but uniformly larger ones, than when planted near the surface of the ground.

Rhubarb, likewise, is much benefited by a liberal covering of manure, and will amply reward this attention with a bountiful supply of large, succulent and tender stalks.

POTATO SEEDLINGS.

It is rare fun to raise seedling Potatoes, and does not cost much either. The seed from the balls can be sown in a shallow box with earth in it early in March if you choose, and kept in a warm room near the window. When I came to transfer the young plants, of which there were several hundred, to the garden, the precocious little upstarts already had new Potatoes on them, though the plants were no more than two inches high. Phyllogenitiveness must be large in the Potato, one would judge upon observing this precocious tendency.

In the fall, when the first season's growth is completed, it is amusing to pull up the little plants with the whole new-born family of Potatoes attached to them, differing in size from that of a Walnut down to a pin-head, exact representations of what they intend to be on a larger scale in future years. You can form a correct estimate the first year of many of the characteristics of a new variety; whether prolific or otherwise; whether round, long, flat, or smooth.

Although most seedling Potatoes have a strong family likeness derived from their parents, there are also to be found among them many marks of individual character and originality. I have sown thousands of seeds, from the White Peachblow, the parent of which was red, hardy, and full of life and vigor. It was curious to notice what a mingling there was of the characteristics of the parents and the grandparents in the generation that followed. In regard to color, there seemed to be every conceivable variation. At one extreme I had a monstrous red Potato, rough, with deeply sunken eyes, with red veins threading its short, stout, abundant, and sticky stems and leaves. Moreover, the inside of the Potato was as red as a Beet. According to the estimate that I made of the quantity obtained from a dozen hills,—the product of a single tuber,—it yielded at the rate of six hundred bushels to the acre. It manifested much willfulness and hardness of heart, which became apparent when I undertook to have some moderate sized specimens cooked, and accordingly had them put in the steamer with the rest that were intended for dinner. I waited with all impatience for the cook to bring them on so that I could give them the first trial. But they were not forthcoming, and I missed them that day. Upon inquiry I learned that the obstinate tubers would not soften in the hot steam in the same time that it took the others to cook. So another trial was made the next day, and after remaining about twice as long as its neighbors in the hot steam, it finally yielded. On opening it, its intense pink color did not seem the "pink of perfection" in a Potato, and though I have tasted worse Potatoes than that, it was tolerably meanly.

On the whole, I could not recommend that Potato to poor people, for, notwithstanding it was an immense yielder, it would cost so much fuel to cook it, that the economy of raising it was not clearly demonstrated. I christened it "The Mastodon."

In striking contrast to this was what I called "The Peachblow's Grandson." It was smoother than its mother, the White Peachblow, and larger, and I liked it so well that we raised over sixty bushels of it.

Varying between the two kinds above described were to be found red Potatoes with red streaks inside; red Potatoes that were

white or yellow inside; Potatoes that were pure white inside and out; Potatoes with irregular blotches of red and white; Potatoes black and purple; Potatoes long, round, flat, and with every conceivable intermediate form.

Some of the thousands that I raised were half as big as my fist the first year, while many were no bigger than Peas. Usually they were large enough to admit of a fair judgment of their qualities the second year.

If it were possible, I would like to analyze and explain the peculiar charm that attends the raising of seedlings. The nearest that I can do is to point to one peculiarity combined with it and common to many other forms of human activity, namely, that people take hold of it with zest.

Every one loves to control and direct great and mysterious forces, the working and results of which cannot be easily estimated. It is fascinating to a novice to hoist the gate of a water-wheel that drives a great mass of machinery, to control the motions of a locomotive, to fire a gun, or to drive a spirited or powerful team of horses,—in short, to do anything that moves and directs a power greater than one's self.

Just so in raising Potato or any other seedlings we are dealing with the great, powerful, and mysterious principle of creative forces, capable of producing curious and grotesque as well as beautiful and valuable results. One feels almost as being taken into a kind of partnership with creation, which permits us to take part in the work of improving and beautifying the earth. We imagine ourselves wielding a power capable of producing results far beyond the limits of our conception.

H. J. SEYMOUR.

BLEACHING CELERY.

The method of bleaching Celery, used by James Wright, of East Toledo, who raises the finest Celery that J. S. Woodward, of the Rural New Yorker, says he ever saw, and which never produces rust, is that he merely earths a little, to keep the stalks upright until sufficiently grown; he then has some strips of the thinnest, lightest tin, about fourteen inches wide, and in the after-part of the day, when the Celery is perfectly dry, he first snickers the plants, removing everything that would not make first-class Celery, and then wraps one of the pieces of tin about the plant, and over this he slips a three-inch round tile twelve inches long; then draws the tin out, leaving the Celery compact and straight inside the tiles. It will bleach finely in two weeks in hot weather, and as the weather gets colder it takes longer—up to about four weeks. The labor of applying and removing the soil commonly used costs about as much as the tiles.

PLANTING MELONS WITH POTATOES.

A correspondent of the Western Plowman experimented with raising Melons among Potatoes, and found the method effective in ridding the Melon vines of the striped bug. He suggests that it would be a good plan to plant Potatoes or something else with the Melons, to hide the vines until the bug season is over, and then dig the Potatoes and let the Melons have all the room.

THE SQUASH AND ITS CULTURE.

As a contribution to the table, the rich and mealy flesh of the improved varieties of Winter Squash occupies a place that nothing else can entirely fill. It has become almost a necessity, in its season, to those who set fine tables; and, with roast turkey and Cranberry sauce, it is always associated in our minds with the festivities of Thanksgiving and Christmas.

The Squash, in its best estate, is decidedly a modern vegetable. True, the old, warted

BOSTON MARROW SQUASH.

Crook-necks, with their pale, insipid and watery flesh, are relics of the Puritan days. But the delicious Hubbard, Butman, Marblehead, Olive and Boston Marrow are all children of the latter decades. Unfortunately, these highly improved varieties have left off a part of the vigor and hardiness of their coarser ancestors. Some claim that this weakening of the constitution is an inseparable companion of refinement in quality in all our fruits and vegetables. Can this be true?

Although the Squash seems to be peculiarly at home in the gardens of New England, it is none the less a tropical plant. Its foliage is sensitive to slight frost, and its vine develops best in our hottest and wettest seasons. Therefore we should plant Squashes on the warmest soil, and, when possible, in a sheltered situation. It is little use to plant the seeds before the ground has become well warmed in spring. If planted too early they are liable to rot during cold rains. In the Northern States the middle of May is early enough.

Squashes thrive best when an abundance

well to put the manure where the roots naturally grow. A little bone-dust or guano thoroughly mixed with the soil of the hill before planting will prove a valuable addition as a stimulant to the young plants.

Insect enemies form the chief obstacle to successful Squash growing. For the private gardener I have no hesitation in recommending protection for the young plants as the best means of escaping the ravages of the striped bug. Light boxes, without bottom, covered with mosquito netting, placed over the hills before the plants are up, are a certain remedy. For the Squash-borer, that begins its depredations later in the season, I have used the past summer, with marked success, half a teaspoonful of Paris green, mixed with a gallon of water, sprinkling the mixture upon the stems after every rain. In vigorous running varieties like the Hubbard, the stems should be wet with the mixture for a distance of at least six feet from the base of the plant. The application should be commenced about the middle of July, and be continued until the middle of September.

The summer varieties of Squash, though less popular than the winter sorts, are nevertheless worth raising. They are more hardy, and occupy less room than the later ones. Perhaps the best varieties for summer are the White and Yellow Scallop Bush. These

PERFECT GEM SQUASH.

may be planted in rows six feet apart each way. After the fruits of these become too hard for use, it will be time to commence upon the winter sorts. For quality I can name no better varieties for autumn and winter than the four mentioned near the beginning of this article. The Perfect Gem is hardier than any of these named, but, though very good, is, with me, a little lacking in richness.

When stored in a cool, dry room, that is never allowed to go below the freezing point, the Hubbard, Butman, and Perfect Gem will keep until January, or even longer.

"ELM."

PEAS AND LIMA BEANS.

Although it will be some time before we shall plant Peas and Beans again, some statements about Peas in recent numbers of THE AMERICAN GARDEN suggest that my experiments in Pea planting may be of interest to some of its readers.

I like to plant Peas early by thoroughly preparing the soil, getting it in a good con-

dition, and planting the seeds not less than three inches deep, covering it well. I find that Peas do best on a good, loamy soil, partially mixed with sand.

This year I tried the American Wonder Pea, McLean's Little Gem, Tom Thumb, and Cleveland's Rural New Yorker. Planting all the same day and in the same kind of soil, and giving the same kind of cultivation, the American Wonder gave me the earliest and the most prolific crop.

I also tried the plan of planting bush or running Peas in circles, instead of in rows.

HUBBARD SQUASH.

My usual plan is to plant two rows four or six inches apart, and the next two rows two feet from the first, so as to give room to walk between when brushing. This year I planted a plot in small circles about one foot in diameter, close together in the row, and the rows far enough apart, so that I could walk readily between them. A good stout brush, with as many branches as possible, was stuck in the middle, and answered for all the vines in the circle. I find it much easier picking, and as an equal number of vines can be raised in a row of circles as in two rows planted in drills close together, and less brush is required, I am convinced that this plan is a considerable improvement.

Last year I tried the plan of planting a row of Lima Beans reasonably close together, and then brushing the same as Peas, only using longer and stouter sticks than for Peas. Although I had planted but one small row that way, I liked it so well that this year I tried the plan more fully, and must say that it was a decided improvement, as I can raise more Beans in the same space of

BUTMAN SQUASH.

OLIVE SQUASH.

of well-rotted manure is used. Some recommend putting all of the manure in the hill where the seeds are planted. It is a question, however, if it is not better to spread it over the whole surface of the ground, working it into the upper six inches of the soil. We are apt to forget that the roots of Squashes creep nearly as far as their stems. They like the warm soil near the surface, and it is

ground, with less cultivation, than by the old method of having three or four Beans planted around each pole.

It has also the additional advantage that they bear earlier, as every grower of Lima Beans is aware that the vines will not bear much before they have reached the top of their supports, unless they are pinched in.

N. J. SHEPHERD.

The Fruit Garden.

SEASONABLE HINTS.

Keeping Grapes.—It is of no use to try to keep Concord in good condition for more than a few weeks. After having tried almost every method recommended, we have given up the attempt to keep thin-skinned varieties, and we fully agree with the sentiment somewhat tersely expressed by the *Farm Journal*:

"Fussing up Grapes with cotton, sawdust, paper, wax, and so on, to keep them into winter, is all nonsense. Let the Grapes ripen perfectly, and then carefully pack into shallow boxes, or baskets, and, without changing or disturbing, keep them in the coolest place you can command. That's all there is of it. The cooler the better, so they don't freeze. Some Grapes won't keep any way; don't fool with them. Try the thick-skinned ones. Diana, Catawba, Isabella, and Salem have good reputations as keepers."

Selling Fruits.—A few Pears, Apples, Peaches, with a bunch or two of Grapes, and a few green leaves and flowers on the top, all neatly arranged in a small basket and costing at retail about twenty-five cents, sell readily in our fruit stores for seventy-five cents to a dollar, simply because the whole arrangement is pleasing and attractive and convenient to handle. This same principle applies to the selling of almost everything, and fruit-growers might take a hint or two from the lesson.

Some fruit-growers also injure their reputation as well as their pockets, more than they are aware of, by dishonest "topping off." To sell a barrel of inferior fruit for first-class because its top is veneered with a layer of good specimens is as much a fraud as it is to sell plated ware for solid silver. Market men suffer from this, unfortunately, growing practice fully as much as the growers themselves, as consumers prefer not to buy at all rather than be cheated every time.

"The principal discouragement to the purchase of Apples by the barrel by families," said a prominent Washington Market dealer, "is the contemptible way of filling barrels; a nice layer on top and bottom, but the majority small, mean fruit."

Labels.—The most durable and convenient label for trees is a strip of rough zinc. If ordinary smooth zinc has to be used, it should be immersed in diluted muriatic acid for a few minutes, to roughen the surface. Ordinary pencil-writing will last for many years on such labels; they may be fastened with a copper wire, or if the strips are cut long enough their ends may be twisted around small limbs.

There is nothing more discouraging, after having planted a collection of fruits, than to find when they come into bearing that the labels have become detached and every trace of them lost. The wise thing to do, therefore, is to examine every newly planted tree before winter storms have blown off the labels, and fasten them securely. And the still wiser thing after that is to make an accurate map of the orchard, no matter how rough, indicating the exact position and name of every tree, so that it may be identified at a glance, independent of labels.

PRUNING RASPBERRIES.

When I began cultivating Raspberries the bush method was unknown, and I pruned only in the spring. During the summer the canes were not pruned, and I did not remove the old canes in the fall. In the spring I broke or cut out the old canes, cut back the green wood to a length of three to four feet, and tied the bushes to stakes, and later wired them to stakes, or tied them to wire stretched along the row. Even yet the bush method does not obtain in many localities, and for those it will be well to say something of fall or spring pruning.

I began by removing the old canes in the spring, but became convinced it was better to remove them early in the fall. It is objected to the removal of the old canes in the fall that their leaves would not play an important part in the growth of the young wood; that they would hold the snow; and that as the condition of the hill the next spring cannot be determined, the work must be partial and done at hap-hazard.

In reply to this I have to say that, in my locality (western Illinois, just on the fortieth parallel), the canes have winter-killed but once in a dozen years, and then the injury was only partial; that I have found the old canes inadequate to hold the snow against our driving prairie winds, and that only one winter was the protection of the snow required; that the new canes as effectually secure the drifting of the snow about them, when we have a drifting wind, as they would together with the old canes; that the office which the leaves of the old canes perform in the growth of the new is greatly overestimated in its importance, if such office exists at all; that it is much more convenient to do this work in the fall than in the spring, when there is certainly enough other work to keep us busy; and that the field looks much better without the old canes than with them. In addition, by cutting out and burning old canes (the latter should always be promptly done) soon after fruiting, you will destroy noxious insects and worms in various stages of growth, which otherwise would injure the canes.

Some extensive growers of my acquaintance do not remove the old canes at all. They claim that this slovenly plan works well, but on general principles I would oppose it, though I must confess that I have never tried it. I have found no difficulty in properly treating the new canes in the fall, and I do not see why any person of good judgment should.

The bush method saves stakes, wire, or twine, and all the disagreeable work of tying up, and I would strongly recommend it, though it entails frequent prunings during the summer. But these prunings can be done very rapidly. The object is to transform the cane into a little tree which will be self-supporting. As the pruning consists in removing the tip of the cane only, it can be done by pinching with the thumb and finger, or with a pruning-knife, large scissors, hedge-trimmer, or sheep-shears; but as pinching allows of the use of both hands, it is the best method.

The first year's growth must be pinched back when eight or ten inches high. Each succeeding year the tips of the growing shoots are pinched back when from twenty-four to thirty inches high. This stops their growth upward, and as the energy of the cane

must expend itself in some direction, it throws out laterals. These laterals balance and support the stem and do away with the necessity for supports. As not all the canes will be ready for pinching back at the same time, it will be necessary to go over the plantation about once a week, walking between two rows and pinching on each side. In the end you will gain time by making weekly prunings, when you can pinch off the tip between your thumb and finger, instead of pruning only once, when you will have to remove more or less wood; and the first is by far the best for the canes.

In spring the laterals must be cut back to a length of about one foot, and for this pruning I have found nothing so good as a pair of sheep-shears. With these or a pruning-knife the work can be done very rapidly. I have not been as successful in my efforts to train the reds into bushes. It is best not to pinch them back at all the first season, but afterward to keep them well cut back.

JOHN M. STAHL.

INFLUENCE OF POLLEN UPON FRUITS.

Prof. Lazenby's carefully conducted experiments with pollenating pistillate varieties of Strawberries seem to furnish unmistakable proofs that the appearance and character of the berries are modified by the pollen. The characteristics of the male parent were plainly evident in each case, with the Crescent as well as the Manchester.

Where the pollen of the Cumberland was used the color was very light and the berries exceedingly soft. Those fertilized with the pollen of the James Vick were small, but very firm and remarkably perfect in outline. The cross with the Charles Downing showed a marked resemblance in shape, color, and consistency to this well-known variety. Where the Sharpless was used as the male parent the berries were large and irregular, and much more imperfect than those of any other.

STRAWBERRY FERTILIZERS.

Bone-dust and wood-ashes will supply all that may be lacking for Strawberries in any soil, says M. Crawford, of Ohio, and these can be obtained in nearly all parts of the country. Of all the commercial fertilizers none is safer to buy than pure ground bone. It must, however, be decomposed before the plants can use it, as they take up all their food in solution. For immediate effect it is sometimes advisable to use dissolved bone (superphosphate of lime), which will be washed down to the roots by the first rain.

THINNING PEACHES.

Thinning fruit is one of the arts which are less understood and practiced by fruit-growers than any other; yet every one who tries it becomes convinced of its great usefulness, and the following experience of our esteemed correspondent, Wm. M. Bowron, of Tennessee, is well worth remembering another season:

After having thinned the Peaches from a particular tree that last year produced fruit the size of small Plums, so as to leave only one Peach to a spur, the tree was borne to the ground with the largest fruit in my garden.

A VALUABLE NEW CHERRY.

THE WINDSOR.

Early ripening has for some time been considered by many the leading point to be gained in new fruits, and frequently to the neglect of other not less desirable qualifications. For home use and for northern markets lateness is often of more importance in a variety than extreme early ripening.

The accompanying illustration shows the shape and general appearance of a new Cherry, which seems to possess all the desirable qualities of a late variety. It is now being introduced by Messrs. Ellwanger & Barry, of Rochester, N. Y., who describe it as follows:

"Fruit large, liver-colored, resembling the Elkhorn, or Tradescant's Black Heart, nevertheless quite distinct; ripens three or four days after that variety; flesh remarkably firm and of fine quality. Tree hardy and very prolific. Promises to be a valuable late variety for market and for family use."

VENTILATION FOR FRUIT CELLARS.

The fruit crop, or that portion of it which is to be stored during winter, is now, doubtless, in the quarters that it is to occupy for many months to come. The greatest drawback to good preservation in our cold northern climates, is the close air in which we have to confine our fruit in order to keep it secure against frost.

We have learned from experience that the temperature of the fruit cellar must be kept well down toward the freezing point, so that fermentation may not take place in the juices of the fruit, thus causing early decay; and we have learned, too, that where the temperature of the cellar is kept so low, that the moisture and heavy impurities, which gather where fruit or vegetables are stored, will not readily pass off from a cold and consequently heavy air that holds them near the ground.

Such heavy air will not readily rise and pass off through the ordinary channels provided for ventilation. To make it rise it must first be lightened. How to lighten the air or raise the temperature of the cellar, without injuring the fruit stored within, was a question that has long baffled me.

One winter, as an experiment, I stored my fruit well back from the center of the cellar, and placed a small wood heater in the middle of the large space thus left. It was an extremely cold winter, and my heater served two purposes—preventing the temperature from getting too low, and giving my cellar splendid ventilation.

I kept only a very light fire for perhaps two or three hours a day. The board partitions and straw covering over the bins protected the fruit against any undue heat, while the heavy foul air of the cellar was warmed and lightened by this means, and drawn off through the stove and chimney.

As I had no facilities to carry the piping up into the chimney-flue of the house, I

constructed a chimney in the following manner, a description of which may interest others who are similarly situated.

I took two pieces of inch lumber four inches wide, and two that were eight inches wide each. One side of these pieces I covered over with sheet-iron, drawing it tight and firm, and nailing it on the edges of the boards. Then I put the four pieces together so that they made a sheet-iron lined flue with a throat of four inches by eight. I used long, heavy nails in putting it together in order to draw the joints tight and close. In the lower end that was to rest on the ground, I fitted an end piece similarly sheeted over. About four inches above this and in the broad side of the flue was cut a hole of the size of the pipe to be used, the edges of which opening were also protected with strips of sheet-iron.

This flue was placed just outside the cellar

THE WINDSOR CHERRY.

window, the foot of it on a large flat stone, and the top, sixteen feet above, fastened by strips of zinc to the gable end of the kitchen wing. A pane of glass was removed from the cellar window, and in its place was fastened a sheet of iron with a hole for the pipe to pass through. There were two elbows and a long stretch of pipe before it entered the chimney, so that with a light fire there was but little heat to endanger the wood-work of the flue.

I never before had my fruit and vegetables keep so well as they have since I commenced using this heater in the cellar. It not only serves for ventilating and regulating the temperature, but the air of the whole house will be the purer and pleasanter for a fire occasionally in the cellar, not to mention the additional comfort of knowing one's stores to be safe, even in the coldest weather.

W. D. BOYNTON.

A GOOD MARKET FOR DRIED FRUITS.

While overproduction in almost every branch of industry is complained of not only here but in Europe, dried fruits appear as yet not to be in excess of the demand. The apparatus necessary for evaporating fruits of all kinds is comparatively not expensive; and, with proper management, will pay for itself in a short time. Of course, this, as any other industry, may be overdone, if everybody should rush into it; but to judge from the following remarks of the *London Produce Market Review*, the time seems to be not near at hand:

"There is no country enjoying a fairly temperate climate in which home-grown fruit is so scarce and so dear as in England, while we have heard it said that in some parts of America Peaches are so abundant as to be hardly worth gathering. There can be no question that the demand for dried and preserved fruits is capable of almost indefinite expansion, with larger and more varied supplies, for the supply at present is so inadequate, that some varieties, even of leading descriptions, cannot be had for months at a time, and the trade, indeed, almost comes to a stand-still during the summer, not so much because of the supply of green fruit—for that is always very dear in the larger towns—but simply because there is so little dried fruit to sell."

FRUIT-MERCHANTS NECESSARY.

There has been some wild and foolish talk in certain rural circles about that superfluous being in the world, the middle-man. "I think," says Parker Earl, President of the Mississippi Valley Horticultural Society, "that this talk has never done any good. I am sure it has done much harm. Strike down the agency of the commission merchant and we should have no grand system of commercial fruit-growing. There doubtless are rascals in this trade, as in all others; but this should not lead us to reflect unfairly upon a very large, useful, and honest class of merchants. I have had something to do with fruit commission men for the past quarter of a century, having done business with over one hundred and fifty of them in some eighty cities and twenty States, without having been cheated of a dollar in all that acquaintance. I desire that they shall feel fully identified with the interests of fruit-growers, or with all schemes which tend to the healthful development of so grand an institution as American horticulture."

THE MINNEWASKA BLACKBERRY.

A sample box and clusters of this new variety were received this summer from A. J. Caywood & Son, Marlboro, N. Y. The clusters were large, very full, and remarkably evenly ripened. The berries were of good size and quality, notwithstanding their having ripened during several days of rain. Their entire freedom from a hard core was especially noticed. This in answer to a subscriber from N. Y.

The Flower Garden.

OUR GARDENS.

Written for THE AMERICAN GARDEN.

With swirling wind and nipping mornings,
December's come,
Piping his keen but friendly warnings
Around my home.

The garden, with its wealth of gladness,
Its lavish cheer,
All pale and drooping turns to sadness,
And shrinks with fear.

The graceful vine that lent us beauty
Bends to the knife;
In ripened seed fulfills its duty,
But yields its life.

The bright-hued borders turn to mourning,
No longer gay;
They're done with nodding and adorning
From now till May!

So cruel fortune makes us tremble
At touch of ill;
Or bids, may be, the lip dissemble
That quivers still.

But lives and gardens lose and borrow
And glow anew;
We plant to-day, we trust to-morrow,
And still pursue.

Man's his own fortune—laughs at Nature—
Makes his own cheer;
Compels all climes, and to his stature
Would suit the year.

The sunshine of the coal-mine, glowing,
Keeps off the chill,
And flowers, in spite of all the snowing
Bloom at our will.

Spring, with the Snow-drop and the Crocus,
Lies in my hand;
Nor will they murmur, "Who awoke us?"
When tall they stand.

—DORA H. R. GOODALE.

SEASONABLE HINTS.

Dormant Plants.—Some persons suppose that plants not in full leaf, and not growing vigorously during winter, may be stored away anywhere, like a bundle of summer clothing, and come out all right again in spring. This is a great mistake, for plants are never entirely inactive. As in animals, when sleeping, the circulation of the blood, respiration, and evaporation continue their regular course, so are in plants similar processes constantly at work, requiring certain atmospheric and thermal conditions necessary to their existence. Those who succeed best with their plants, in the garden or house, are generally found to make a careful study of the nature, character, and requirements of their pets, and to treat each class according to its special needs and preferences, with as much discrimination as a loving mother would nurse and care for a delicate and feeble child differently from a strong and sturdy one. In other words, to have success with your flowers you must love them, must have them in your heart.

Storing Bulbs requires similar discrimination; Gladiolus, Dahlias, Cannas, may be kept in any frost-proof cellar, provided it is dry; but Tuberoses, Tigridius, and Colocasias have to be wintered in a warmer place, where they are never exposed to a lower temperature than forty degrees. The great point is to keep them perfectly dry.

COLD PITS AND THEIR MANAGEMENT.

One of the most indispensable structures about the flower garden is a cold pit. In it can be kept a good many plants, which, without one, would have to occupy mere valuable space in heated structures, especially these plants used during summer for the decoration of the garden and which do best when kept in a dormant condition during winter, such as Roses, Petunias, Feverfew, Carnations, etc. The labor attending their care is much less when stored in a pit than if kept in a heated greenhouse.

To that large class of readers of THE AMERICAN GARDEN who, although in comfortable circumstances, do not feel disposed to afford labor incident to the care of a greenhouse, cold pits are of great service even in localities where the thermometer reaches zero. Further south, of course, where the temperature is higher, greater benefits can be derived from them, as more tender plants can be kept in them than in northern latitudes.

For large plants of Roses, Carnations, etc., a deep pit is most suitable, and more easily kept warm when sunk into the ground. Let the place for building a pit be selected in some position well sheltered from the north and north-west winds, and if the subsoil be gravelly so much the better, as the water can drain off more freely. If not naturally dry, the spot has to be made so by draining. After the excavation has been made, board up the inside, allowing the back of the pit to be about eighteen inches higher than the front, so that the water can run off freely. A width of six feet is the most suitable for this kind of pit, as then the common 6 x 3 feet sashes will answer, and it may be made any length to suit the requirements.

For Pansies, Daisies, and Forget-me-nots, for blooming Violets and wintering Lettuce, it is only necessary to have a shallow frame about a foot in front and eighteen inches at the back. It is very important to be careful at all times to arrange the frames so that all superfluous water can pass off freely. Water standing any length of time in a pit or frame will soon destroy every plant in it, the roots will decay, and the moist atmosphere causes the soft parts of the plants to damp off and ultimately perish.

Neither hard nor soft wooded plants can endure a close, damp atmosphere without air, light, and warmth; but if the atmosphere is dry it changes the condition—the plants remain in a semi-dormant state, and come out in good shape in the spring.

Plants in pots, kept in a pit, should have good drainage, to prevent the soil from becoming too wet by the retention of water in the pot. On all suitable occasions give all the ventilation possible, and at all times allow the full power of the sun to strike on the glass, guarding at the same time against overheating by judicious ventilation.

It is also necessary to have straw mats and shutters to put on in extreme weather, and during exceptionally cold spells it may be necessary to use straw in addition as a covering. In the Southern States, where the temperature does not fall more than 80 or 10° below freezing, a good many plants will make a slow growth during winter. If regular attention is given to airing, covering, and watering, most plants requiring greenhouse temperature do well in such climates; while further north the variety which can be

kept in pits is more limited. It comprises Tea Roses, Carnations, Feverfew, Ivy, Daphnes, Mimulus, Vines, Petunias, Pinks, Violets, Pansies, Daisies, Forget-me-nots, Laurestinus, Oleanders; and, if well sheltered, Camellias and Azaleas can be kept in most of the Middle States, and in a good many of the Northern States.

Watering has to be done carefully. It is best attended to during the forenoon of clear days, so that there will be a chance for the extra moisture to pass off before night. Water only when the plants are dry, and when it is done do it thoroughly. As spring approaches and clearer and warmer weather sets in, the plants demand more attention and more water, and upon all occasions give plenty of air, so that, instead of the plants being weak and tender when setting-out time comes, they shall be hardy, and able to endure the change with impunity.

MANSFIELD MILTON.

IPOMŒA NOCTIPHYTON.

Having noticed in THE AMERICAN GARDEN some inquiries about the treatment of *Ipomœa noctiphyton*, my experience with this comparatively new plant may be of interest to some of your readers.

In the spring of 1883 I procured a small plant of this *Ipomœa* in a three-inch pot. I immediately repotted it in a five-inch pot, using rich, loamy soil, and then placed it in a warm greenhouse in order to have the plant as strong as possible before planting it out. It grew vigorously, and by the first of June was quite large and well branched, the result of a frequent pinching back of the young shoots. It was then planted out in a well-enriched, deep border, and trained upon a large pillar which it soon covered with its bright green foliage, and it continued to flower freely from July until it was brought inside.

About the middle of September the plant was well cut back, taken up carefully, potted in a six-inch pot, and wintered in a warm greenhouse where it was given a temperature of from 55 to 60 degrees. Water was but sparingly given, as my object was to keep the plant in a dormant state; but the foliage was freely syringed, as a preventive against the attacks of the red spider, to which it is unfortunately very subject when grown under glass.

About the middle of April of this year I encouraged it into growth and planted it out about the middle of May; it soon covered an immense space, and since the first of July has flowered profusely. As soon as frost threatened I cut it back, took it up carefully, potted it, and shall treat it precisely as I did the previous winter.

This *Ipomœa* is one of our most valuable summer-blooming climbing plants, is easily grown, and is of vigorous, rapid growth, soon covering a considerable space with its bright green foliage; and its large, pure white, deliciously scented flowers, opening during the evening only, are produced in the greatest profusion.

The secret of growing it to perfection consists simply in having good, strong, healthy plants at the start, and in giving them a well-enriched, deep soil, with a mulch of coarse littery manure, and copious waterings during periods of drought.

CHAS. E. PARNELL.

SPRING FLOWERING BULBS.

THE SNOW-DROPS.

The pearly white Snow-drop shoots forth from the ground almost as soon as the first clear whistle of the robin and the pure treble notes of the bluebird are heard. It is the leader of the gloriously robed procession of flowers which follow so closely in the foot-prints of the spring. Their tiny bulbs will grow in any soil, and even in the grass-plot they will push up their tiny lance-like leaves, and the flower will hang its sweet head very often before the snow is all gone. They can be planted in clusters of tens or dozens, in spots in the lawn, but as they increase rapidly, unless replanted every three or four years they will run out and die. Plant the small bulbs at the depth of two inches, and one inch apart. The larger variety of Snow-drop, the Giant, which blooms as early, should be planted three inches in depth, and four inches apart. Without an edging of Snow-drops and Crocuses in the flower garden, or clumps of them in the lawn, one is utterly deprived of the joy of gathering the first flowers of the spring.

THE CROCUS.

The Crocus, clothed in royal purple and kingly gold and lilac and blue, with plain or striped petals, should always be planted with the Snow-drops. They should be set an inch or more apart, and two inches in depth, and the last of October or first week of November is the best season to plant them, but they can be put in later. They need not be disturbed for three years, and then should be replanted in other soil. When the leaves are yellow and all withered, cut them off. New varieties are yearly raised from seeds, and it is a pleasant occupation to plant them in shallow seed-pans, then transplant in the beds, and see what shades of color will be produced, for it is the delight of amateur gardeners to possess something rich and rare raised by their own hands.

a. THE COMMON SNOW-DROP.
b. THE GIANT SNOW-DROP.

THE DAFFODILS.

These are showy bulbs which will flower wherever you plant them, and bloom year after year profusely; they are as double as Poppies and as yellow as Sunflowers, and ask no care at your hands until they become root-clogged. Then in autumn remove to another place, dividing the roots of the *Daffy-down-dilly*, as the children call it.

THE LILY OF THE VALLEY.

This fairest and sweetest of all spring flowers, without which no garden can be

complete, asks but little labor from our hands to produce a perfect beauty, and will bloom for a generation, even longer, in the same bed. They prefer a shady locality, where the soil is rich and moist, are perfectly hardy, and require no protection in the coldest climates. Plant dozens of bulbs this season, and early in the spring you can gather quantities of their deliciously fragrant flowers.

THE NARCISSUS.

There are numerous varieties of this most lovely flower, and the Daffodil and Jonquil belong to the same family. The *Polyanthus*

THE SPRING SNOW-FLAKE.

Narcissus, of various kinds, are the prettiest of the species. Those bulbs blossom in clusters of six to twelve flowers on a single stem, and are of every shade, from purest white to darkest orange. The cup of the white varieties is yellow, and of the yellow it is of the darkest orange hue. *Poet's Narcissus* is the most beautiful of its kind, having pure white petals, with a crimped white cup tinged with crimson and a green center.

The *Double Narcissus* is also most desirable for its delicious fragrance and its pure white flowers. They need the same treatment as Hyacinth, and should be planted four inches deep and four inches apart.

The *Anemones*, *Ranunculus*, *Scillas*, *Iris*, *Ixias*, and *Sparaxis* are all required when a perfect bed of spring flowering bulbs is desired. They need similar treatment as the bulbs named, and may be planted among them. *Ranunculus* and *Anemones*, however, are tender bulbs which will not bear a northern winter, but must be kept in the house until the ground does not freeze. In milder climates they can be planted in November or December. Their colors are very brilliant, and they will make charming additions to any garden of flowers.

DAISY EYEBRIGHT.

THE AQUILEGIA.

Almost every one who has lived in the country, and gone hunting wild flowers, must know our native *Aquilegia Canadensis*, but quite likely under another name,—that of wild Honeysuckle. It is given this name because the spurs of the peculiarly shaped flower contain a drop of sweetness, like that found in Clover.

Our native species—or rather the one most frequently met with—is yellow and red. For a long time it was neglected, like many other meritorious native plants. When it was taken in hand it showed a willingness to change its colors, and careful crossings of different varieties and species have given us some very fine new ones. We have them in white, scarlet, rich olive, violet, and rose, single and double, and many varieties combine these colors very showily.

The foliage of the *Aquilegia* is very pretty, being borne in dense masses, mostly near the ground, from among which the flower-stalks are thrown up. It is a very hardy herbaceous plant, a most profuse bloomer, and is in bloom for a long time. Most varieties grow to an average height of about three feet. It is a fine plant to use in the background among borders of other herbaceous plants. It can be grown very easily from seed, which is freely produced. Sow in the open ground, at the same time you sow annuals, keep the soil about the plants mellow and clean, and you will have strong, healthy plants by fall, from which you may expect a fine show of flowers the next season.

EBEN E. REXFORD.

A THANKSGIVING BOUQUET.

We have just, this 22d of November, cut a pretty bunch of garden flowers, which in

CROCUS VERSICOLOR.

water will easily keep fresh till Thanksgiving day. Not Chrysanthemums which, of course, are still in full bloom, but from annuals sown in summer, and we are not sure that these belated blossoms, just freeing themselves from the white frost of the previous night, do not afford as much pleasure as their brilliant sisters of the summer garden. Among those in most perfect condition were *Mignonette*, *Phlox Drummondii*, *Phacelia tanacetifolia*, *Centranthus*, or *Rod Virginian*, *Virginian Stock (Malcomia maritima)*, *Godotias*, *Gillias*, *Clarkias*, *Swan River Daisy (Brachycome iberidifolia)*, *Argemone*, *Bartonia aurea*, *Oxyura chrysanthemoides*, an extremely pretty annual, with Chrysanthemum-like, yellow flowers, tipped with white.

The Window Garden AND GREENHOUSE.

WINDOW GARDENING FOR DECEMBER.

WATERING PLANTS.

Observe directions given last month. Soft water is better than hard water; but, no matter what kind you have, never allow your plants to suffer of thirst. Water should be of about the same temperature as the atmosphere of the room in which your plants are growing. In watering plants in pots, lower the watering-pot, so that the spout touches or comes near to the rim of the pots, then pour in gently and fill up to the brim. Don't let it overflow. If you have saucers underneath the pots, don't keep them full of water with the idea that you are doing the plants a kindness, as the opposite would be the case. In watering, do not pour the water into the middle of the pot, as you so often find is done, but toward the outside—that is, around just inside the rims of the pots. Watering right in the middle of the pot and at the base of the stem of the plant, is apt to make a hole in the soil there, and to injure the roots.

Observe plants under natural conditions from Oaks to Cabbages, and you will find that, instead of arising from basin-like hollows or having water-holes at the base of their stems, they emerge from gentle mounds which, instead of retaining the water around the stems, lead it off to where the fibrous roots abound and where it is most required.

Geraniums and Fuchsias are "cast-iron" plants, and will stand much rough usage with apparent impunity; and Callas don't seem to mind how they are watered, providing they get a copious supply. But if you wish a striking example of the evil of water-holes around their base, try it with a sash of Lettuces in winter.

CLEANING PLANTS.

Never allow dead or moldy leaves or wood to rest on or about your plants. If decaying, moldy leaves or flowers fall upon fresh leaves and are allowed to remain there, the fresh leaves will rot also. If the leaves of Callas, Dracenas, Ficuses, and other plants with large, smooth foliage, get dusty, wipe them over with a sponge and soapy water; but, unless they are very bad, I should advise your wiping the leaves of Coleuses and other soft, woolly leaves. Wage war against insects, and spare them not. A little soot mixed in the water you give the plants destroys or dispels earth-worms—mean things in pots.

WINTER FLOWERS.

The following are some of the flowers that I had in quantity last December:

Abutilons, Allamanda Schottii, double Sweet Alyssum, Amaryllis anlica, Begonias, Bouvardias, Callas, Carnations, Cestrum, Paris Daisies, Euphorbia splendens, Gorniums, Heliotropes, Yellow and Catalonia Jessamines, Meteor Marigolds, some Orchids, Mignonette, Poinsettias, Roses, Tropaeolums, Violets, Chinese Primroses, Pansies, Drummond Phlox, Stevias, Fuchsia speciosa, and

several varieties raised from cuttings six months before.

SOIL.

Have some soil under cover, and where it cannot freeze, for use whenever you want it, in winter or early spring. Have sod-loam in one heap, well-rotted manure that is free and not pasty, clean pit or river sand, and, if you can get it, some rich wood soil or leaf mold in other heaps, or in barrels or boxes. By having each kind separate, when you come to repot your plants, you can prepare composts to suit yourself for your several varieties of plants.

I believe there is a vast deal of twaddling nonsense, or, in other words, humbug, in the "best soil" mixtures recommended for the several classes of plants. European horticultural literature is as precise in the constituents of its composts or soils for the different classes of plants as doctors are with drugs in medical prescriptions. Visit our vast floricultural emporiums, where

THE BERMUDA EASTER LILY.

plants, in millenary variety, are handled, and you will find no "best" soil composts to trammel the dispatch of business. It is simply a question of plain, rich, richer, richest, according to the nature of the plants. Such a thing as one-fourth each of peat, loam, leaf mold, and sharp sand, or any other rigid rule, is never entertained. But porous and well-drained soils are absolutely necessary for the welfare of plants growing in pots.

MANURE.

I use well-rotted farm-yard manure, and take in a fair supply before winter sets in; but the bulk of my potting manure I bring in in a frozen state. Rich manure is very full of worms, and I don't want them in my potting soil if I can help it. As frost ad-

vances into soil or manure, the worms get down a little deeper, and this is why—I to get rid of the worms—I prefer housing the manure when it is frozen. Of cow manure, such as the dry cakes I find in the summer pastures, I gather a lot every year, let it freeze, then bring it into the bins in the warm sheds. Cow manure seems to contain more insect vermin than horse manure.

LIQUID MANURE.

Guano, or sheep, or hen-house manure is often used in water for liquid manuring. Sometimes an old bag is partly filled with farm-yard manure, or put into a barrel of water, so that the manurial substance may leach through into the water. After the barrel has been emptied of water once or twice, the manure in the bag is thrown out and fresh manure introduced, and the sack replaced in the barrel as before. This is how I make it in winter. During the summer, I have one or more barrels sunk into the ground, so that their brims are an inch or two beneath the ground level, and into the side of the manure piles. Every rain fills these barrels full of the richest material, and the drainage from the heaps settles into them all the time.

WM. FALCONER.

THE BERMUDA EASTER LILY.

(*Lilium Harrisii.*)

Our illustration represents a specimen of this magnificent Lily, exhibited last spring at a meeting of the New-York Horticultural Society. This variety of *Lilium longiflorum*, brought here from the Bermuda Islands, has elicited considerable discussion as to its being sufficiently distinct to justify its introduction as a new variety. Having grown both kinds side by side in the open ground, we confess our inability to detect any material difference under these conditions. Nevertheless, for foreing, those who have had most extensive experience consider the true Bermuda Lily far superior to the common kind. It not only can be forced earlier into bloom, so that flowers may be obtained by Christmas, but under proper treatment it produces a greater number of flowers, and of larger size. Such superb specimens of Bermuda Easter Lilies as may be seen at almost any winter meeting of the New-York Horticultural Society have certainly never been shown of the common *L. longiflorum*.

DUTCH BULBS.

If not already planted, there is still time to get a few bulbs of Hyacinths, Roman Hyacinths, Tulips, Jonquils, and Polyanthus Narcissus; pot them, pulling, according to size, one or several bulbs into a five-inch pot. Then water as you would a newly potted plant of any kind. Set the pots out-of-doors and close together, and cover them over three or four inches deep with sand, ashes, or earth. Before hard frost sets in, remove the pots to the cellar or other cool place, but away from frost, and cover over us before. A few at a time may be brought up to the window of a warm room, and thus a succession of flowers be maintained.

AMARYLLIS.

Among winter-flowering bulbs, the Amaryllis, in its various species and innumerable hybrids, the general character of which latter is shown in our illustration, takes a prominent place. In fact, it would be difficult to imagine a more beautiful and showy ornament to the window-garden than a well-grown Amaryllis in bloom, and yet it is comparatively seldom seen by amateurs.

There is not the least difficulty in growing it in the house, if its necessary wants, which are easily provided for, are complied with. The great point to observe in its cultivation is that the bulbs must have a season of rest after blooming, without being dried up altogether. This state is best produced by giving gradually less water until the plants have ceased growing, when only enough should be furnished to prevent their shriveling up.

The bulbs should during their season of rest remain in the pots, in some dry place. As the roots remain on the bulbs all the time, taking them out of the pots to dry, as is done with Hyacinths and Tulips, is a most injurious proceeding, which almost always results in non-flowering. A soil composed of well-decayed leaf-mold and sandy loam is best for Amaryllis, but it is not necessary to repot them every year.

When wanted for winter flowering, the pots are to be brought to a warmer place, near the light, and gradually watered more frequently. The leaves, and with them generally the flower-stalks, will soon appear, when a full supply of water has to be given. If wanted for summer flowering outdoors, they should be kept dormant during winter, transferred to the open ground in spring, and taken up again in autumn.

A WINTER-HOUSE FOR PLANTS.

Several years ago I planned and built a house or pit for keeping dormant plants. My greenhouse was small, and as I wanted a succession of flowers in winter and spring, the following plan was adopted, as being easily managed, with little expense besides the first cost of what I call my "winter-house."

It was built by digging a pit into the face of a gentle slope, so as to secure drainage, nine feet wide and twenty-five feet in length. At the time it was made I was so doubtful of the success of the experiment, that I used two-inch chestnut plank for lining, fearing that I might have to pull it down in a year or two if it did not work. But now I am so well pleased with it that when the planks give out I intend to replace them with a brick wall eight inches in thickness. The soil thrown out of the pit was banked up on the north side of the excavation seven feet high from the floor and supported by the plank wall. The south side was four feet high. Lengthwise of the pit, three feet from

the north side, a row of posts was set, which support a plank floor over which the earth was thrown one foot thick. This gives standing room and a place for shelves and benches under it. The earth was sloped up to and over the top, and around the ends and front; this was turfed over, and the open space on the south side covered with three by six feet sashes, such as are used for hot-beds. The entrance to the pit is on the east end through double doors.

The temperature of this pit with the glass on in sunny winter days is as high as 60°, and when the mercury falls to 20° below zero, it will not freeze enough to do harm to anything I have kept in it. During a few of the coldest nights in midwinter, after short,

forcing. The pit being below the ground and well protected on all sides by the earth about it, is much warmer than one would suppose.

On the shelf above the bench are "flats," in which the earth is four inches deep; these contain thrifty seedlings of Verbenas and Pansies. These remain partly shaded, cool, and do not make any growth to speak of. Insects find it too cool for comfort, and do not trouble the plants. The green fly will maintain a bare existence, but can be easily kept in check.

Under the bench I keep such roots and plants in pots as require shade. In the open space between the bench and the south side of the pit is room for the large lawn plants, that often cumber the cellar and maintain a precarious existence in a furnace-heated house.

Geraniums cut back and potted, or placed directly in the dirt floor, live over to make large, nice plants for another year. The plants need very little water or change of air, except such as comes from opening the doors in going in and out. Roses keep nicely here, can be tended without trouble, and will make some new growth as the long spring days come near. In addition to its value for storing plants, I have found that Celery and many other vegetables will here keep very nicely. Active plants set in boxes in the fall will live for early setting in the spring, also Cabbages and similar plants.

The only secret of success with such a structure is to let all the sunlight in, by taking off the shutters every day when it does not snow, from nine A. M. to four P. M. In stormy weather, and when a storm threatens, the shutters should always be put on, and kept on. After every snow-fall the snow should be cleared off to let in the sun. Sometimes in very stormy weather I clean alternate ends of the pit, and let the sun in on one end only at a time; this gives sufficient light for the time.

If it is not feasible to plan such a pit deep enough under ground, it is of the greatest importance that it be well protected by banking soil against the sides all around. It may also be so arranged that it can be entered from some building.

Considering all points, I have never attempted anything in the garden which, for the outlay, gave me so much satisfaction as this "winter-house."

W. H. BULL.

A NEGLECTED HOUSE-PLANT.

Common as it is, we do not know a prettier and more graceful herbaceous plant than the Bleeding Heart (*Dicentra spectabilis*), especially for house culture. A small clump may be taken up at any time before the ground is frozen, transplanted in rich soil in a sufficiently large pot, and treated similar to Dutch Bulbs, with which it harmonizes well.

HYBRID AMARYLLIS.

sunless days, I have covered the most tender plants with papers, or kept a kerosene stove or a lantern burning for a few hours. No fire is needed, shutters laid over the glass at night and taken off in the morning to let the sunlight in will be protection enough. In the summer the sashes are taken off and the rafters and the whole interior left exposed to sun and air.

In the fall I bring into this pit Callas, Rosés, and Carnations, all pot-grown through the summer; plunge them in the soil on the benches, water once, and give no further care till I bring them into the hot-house for

Lawn and Landscape.

GOOD LAWN TREES.

Spring Grove Cemetery, near Cincinnati, widely known as one of the most judiciously arranged and most tastefully planted cemeteries in the country, offers rare opportunities for studying trees. Mr. Strauch, who won fame and honor with the creation of this beautiful specimen of landscape art, was both a lover and excellent judge of trees, and brought here together specimens of most of our native as well as of the best foreign species, which may be seen of many different ages and in various combinations.

At a recent visit I was particularly attracted by a plot of about an acre in extent, on which were planted five kinds of our most beautiful lawn trees, the several specimens of each being so arranged as to present their special characteristics to the best advantage. They had probably been planted about eighteen years as they had reached a diameter of six or seven inches, three feet from the lawn.

THE SCARLET OAK.

This was undoubtedly the most beautiful tree. Its clean stem, its slender limbs, and still more slender sprays with beautiful, glossy, dark-green leaves, made me wonder why it is not oftener planted. It was Dr. Warder's favorite tree, and I once heard him recommend the close planting of it in large groups, to be cut back once in two years. Such a mass would be beautiful all summer, and as the Indian summer days drew near their close it would be glorious in its scarlet hue.

THE SUGAR MAPLE

with its dark foliage and neat, regular outline, came next the Scarlet Oak. It is everywhere the American favorite tree, and is too well known to need description or encomium.

THE SYCAMORE MAPLE.

Though little known and seldom planted, this combines the beautiful features of two of our best trees, the Sycamore and the Maple. Its large, sharp-cut leaves on long petioles give it a most distinct appearance. The specimens were hardly old enough to show their greatest beauty, the new growth being so rank; but the tone of the tree is warmer than that of the Sugar Maple, and produced a pleasant contrast.

THE LIQUIDAMBAR, OR SWEET GUM.

This tree was a favorite with A. J. Downing, and Frank Scott laments the perversity of taste that fails to make it more generally planted. In appearance (or "touch," as the artists say) it is different from all other trees. Its leaves, like irregular five-pointed stars, hang perpendicular, and remind one of the *Ricinus*, or Castor-oil Bean. When young, this tree grows in a natural pyramidal form; but, as it gets older, its form is more like the Maple's, with which it harmonizes well in planting. In spring, its opening leaves emit an amber-like fragrance; and during October its foliage becomes clothed in gorgeous coloring, similar to a crimson Tulip. Its secondary branches have a peculiar bark formation, singular and striking. The trunk exudes a transparent gum, and at the South the leaves are sometimes covered with a

sweet, glutinous excretion. The extreme heat and drought of southern Ohio this summer had led to this exudation from the leaves, which I have never seen upon this tree at the North before. Entire leaves, or parts of leaves, had adhered, causing decay and discoloration, sadly marring the foliage.

THE EUROPEAN LINDEN.

The drought had injured these trees somewhat, so that they were not looking their best. This tree, however, reaches its highest beauty in midsummer, and it is hardly fair to criticise its appearance in October.

This grove of trees lacked but one factor to give it perfection, especially toward the close of autumn. There were no Scarlet Maples.

THE SCARLET MAPLE.

Specimens of this, the most beautiful autumn tree, were scarce even in other parts of the grounds; yet I noticed a tree which must be an object of rare beauty when it puts on its autumnal dress. It was rather a dwarf specimen, not more than twenty feet high, while its "drip" was fully thirty feet in diameter. Its branches rested upon the ground, which was sloping and bordered with a close background of Oaks. Many beautiful specimens of Oaks, both Red and Overcup, as well as of other trees, are to be seen at Spring Grove, but none seemed to me to surpass the above-mentioned in beauty and perfection of form.

L. B. PIERCE.

CONSTRUCTION OF ROADS AND WALKS.

Very much of personal comfort and pleasure in suburban localities depends upon good roads. A smooth, firm, dry road is one of the greatest conveniences and enjoyments, while rough and soft muddy roads are among drawbacks and annoyances anywhere. Bad roads form the greatest obstacles to progress and permanent improvements in all neighborhoods which are blasted with their existence; they have a demoralizing effect upon the inhabitants, and are a sure sign of poverty or mismanagement, or both.

The main point involved in maintaining a good road is to keep it dry. Water is the worst enemy to good roads. A clay road is a good road so long as it is perfectly dry. In order, then, to keep a road dry, it is necessary to keep it somewhat higher than the surface, so that water will leave it quickly. Therefore, the greater part of a walk should be laid on the surface of the ground.

Merely for a foot-walk no great depth of material is needed. Deep excavations filled up with stones and finished level with, or, as more frequently seen, a little lower than the ground, may be serviceable for wagon-courses, but a comfortable and dry foot-path in all weathers is not thus obtained.

No good road ever was, or ever can be, made of gravel, and those who have the best experience in road-making never use gravel, unless in some cases to fill up interstices in the surface, and then half an inch or so is all that is necessary.

The details of road-making may be briefly described as follows: After locating the road and marking out its course, the sides should be brought to the proper grade, and finished

by laying a sod about a foot in width, to keep the edge perfect and as a guide to further operations. The road-bed is then formed by excavating and removing the soil to a depth of six inches below the top of the sod at the sides, sloping it up to the center at the rate of two inches to the yard. Thus, higher in the center than at the sides, a road fourteen feet wide would be five inches higher in the center than at the sides. This road-bed should be made perfectly smooth by rolling, so as to insure a uniform surface upon which the material of the road is to be placed.

The best stone for road-making is tough granite. Hard, brittle stone is more readily reduced by pressure, but for the bottom layer this is no defect. About four inches of roughly broken stones are first spread over the road-bed, then a roller is passed over them to press them somewhat in place and to regulate the surface for the next layer, which should consist of broken stone, broken so that each piece could pass through an inch and a half ring. This layer will fill about two inches, and after being leveled by rolling, a sprinkling of small gravel-stones not larger than marbles is then spread evenly over the surface and the roller again applied to compress and form a somewhat smooth surface for the application of a layer of gravel not over one inch in thickness. It is all-important that this layer of gravel should not exceed one inch in thickness, and large gravels should not be allowed in it. A gravel containing reddish-colored clay is the best.

The gravel is merely for the purpose of filling up spaces between the stones on the surface, and should be carefully and evenly distributed, and then rolled until the surface becomes homogeneous, firm, and close. Washed gravel or sandy gravel should not be used where a clayey gravel can be procured, and in no case should gravel be applied in thicker layers than has already been stated.

No detail in road-making is more important than the surface finish. The stones or gravels on the immediate surface of the road should be so small that a wagon-wheel or the foot of a horse will simply press it down; if large enough to be pressed on one end, the other end will be slightly raised, and will soon be found rolling on the top; hence, every stone near the surface should be smaller than the pressing point; then it is not easily disarranged.

The road, when finished, should be filled up at the sides, so as to be nearly level with the top of the sod at the sides. This will allow the water to pass rapidly from the road to the sides. A slight upward slope of the sod will also be favorable, but, above all things, the road should appear to be full. Nothing looks so bad as deep edgings, looking as if they had been cut by a plow.—*William Saunders, before the District of Columbia Horticultural Society.*

ORNAMENTAL HEDGES.

Thomas Meehan recommends for Evergreen hedges, for ornamental boundaries, Norway Spruce, Scotch Pine, Hemlock, and Chinese and American Arbor Vite; and for dwarf dividing lines, the golden *Rotinospora* and the dwarf forms of *Arbor Vite*. Almost any thick-growing shrubs make handsome deciduous hedges.

Foreign Gardening.

ORCHIDS IN PARA.

In a former letter when describing the plants in Senhor Olinda's garden we purposely omitted other than a mere reference to Orchids. Of those there are about five thousand plants in about four hundred and fifty species, all under name and number.

The collection is not confined to Brazilian Orchids, though in number of plants (but not of species) they occupy the prominent place. For instance, of the beautiful *Cattleya El Dorado* there are at least three hundred plants, hardly any two of which are alike in bloom. We see Orchids from all parts of the world, and many of the East Indian species, such as *Vandas*, *Saccolabiums*, *Calanthes*, *Phajus*, and *Aorides*, thrive wonderfully. *Phalaenopsis*, hung in baskets under the trees, are in vigorous health, requiring little care, and that only to see that, if no rain comes, they do not dry up.

Entering the gate, we are at once asked to look at the Orchids in the house, but apologetically, because, as the Senhor says, "it is not the season for Orchids." The greater portion bloom from December to May, but in a large collection there must always be something of interest.

We enter the hall, which is lighted by a large window at the end, and the whole of the alcove so made is arranged as a place to show Orchids in bloom. Large Ferns and *Dracontiums*, growing on trunks of trees, furnish the green background, and all around the Orchids are hung, most being grown on blocks.

At the time of our visit (August) the prevailing color was yellow, from the many species of *Oncidium*. We noticed especially *Oncidium Marshallianum*, *Juncifolium*, *Sarcodes*, *Pubes*, and the charming little *Iridifolium*, with leaves like an outspread fan, and more flowers than plant. *Oncidium Sprucei*, from the upper Rio Negro, is like a gigantic *Juncifolium*, the flowers golden yellow, in immense panicles, and the foliage rush-like, drooping, and five feet in length. It is a very rare and beautiful species. Of *Oncidium papilio*, and the variety *major*, there were fine plants, which are seldom out of bloom, and the large butterfly-like flowers, which seem poised among some Ferns, were very attractive. Large plants of the delicate pink *Oncidium ornithorynchum*, in hanging baskets, filled the hall with perfume, and the lustrous copper-colored flowers of *O. crispum* showed to great advantage.

Plants of *Epidendrum bicornutum*, the free blooming Amazonian variety, wore a mass of pure white flowers, deliciously fragrant, and as fine as *Phalaenopsis grandiflora*, which it much resembles. Some strange *Catasotums* of the *Monacanthus* type, and a grotesque *Coryanthes* were very curious, and *Galeandra Devoniana* and *nivea*, the latter a little gem of a plant, with shell-like, delicate, rosy white flowers, and glaucous foliage; the former, delightfully fragrant, and a large plant of a brilliant *Cattleya superba* completed the group in the hall.

Altogether, there were perhaps forty plants in bloom, and but few species, yet the effect was very good. We can only imagine what it must be when, as was the case from December to February last, the whole house

was filled with *Cattleyas El Dorado*, *tuteola*, and *superba*—some two hundred plants in bloom at once, from one to four spikes, of from two to five flowers on each—every shade from pure white to deep purple, varied by the soft yellow of *Cattleya tuteola*.

Going into the parlor, we saw on the table a beautiful specimen of *Oncidium longipes*. This species has loose panicles of light-yellow flowers, not very brilliant, but very graceful and elegant. Close by was a well-bloomed plant of *Lycaste aromatica*, diffusing its rich Cinnamon fragrance, and in the dining-room were two plants of *Oncidium sphecelatum*, with spikes five foot high, just opening their flowers. Between the windows hung a giant Orchid, probably a new species of *Catasotum*. The plant, from base of pseudo-bulbs to tips of loaves, measures five feet; the pseudo-bulbs are immenso; very thick, and of a silvery gray color; the flower spikes carried about fifty flowers each, very large, richly colored, black, purple, yellow, green and white, which filled the air with the fragrance of *Narcissus poeticus*. This species, unlike most *Catasotums*, remains long in bloom, the flowers lasting in perfection about ten days. It also is fragrant all the time.

E. S. RAND.

(To be continued.)

A CITY OF FLOWERS.

Kingston, the capital of the island of Jamaica, is a city of flowers. It is situated on a gentle slope of the Blue Mountains, close to the water of a delightful bay, and is one of the cheapest places in which to live, I believe, says U. D. Wood, in the *Tribune and Farmer*, that the world contains. Everything grows spontaneously and in abundance. I have seen large baskets, containing at least two bushels of Oranges, Lemons, Pine-apples, Cocoa-nuts, Custard-apples, and other fruits, never seen North, after being carried on the head from five to fifteen miles, and delivered at daylight for ten cents.

The pride of Kingston is in its splendid houses and magnificent gardens. A description of one will answer for the whole. The houses are built on the cover-all-the-ground-you-can-get principle, and every residence is surrounded by a garden,—a block or half block fenced in with a brick wall, or walled in with a board fence, about eight feet high; the ground inclosed is kept in a state of cultivation, planted with choice flowers and shrubbery, and all exquisitely arranged.

The houses are two-story, and the rooms generally thirty feet square, with ceilings twenty feet high; flushings of mahogany, laurel, and ebony. The houses are not sided as in northern climates, but have broad double verandas and Venetian blinds, so that the whole side of the house can be thrown open to admit air in the heat of the day. But the greatest curiosity to a Northern man are the beds; they stand in the center of the room, are six feet high and eight feet square, without head or foot boards; the legs are of polished mahogany. I was told they were made so to prevent snakes and other reptiles from crawling up. A short ladder stands against the wall to climb into bed with.

But, after all, the great attraction of Kingston is in its numerous and magnificent gardens; it has long borne the name of the Flower Garden of the South, and this name it is, without doubt, justly entitled to.

At the North a garden is a place for raising Potatoes, Cabbage, Onions, and other useful vegetables; but here it is a different thing altogether. It is an inclosure, varying in size according to the man's "pile," with a glass house near one corner for such delicate plants as are not partial to the weather to live in, a great variety of flowers and curious-smelling weeds and strange bushes. What ground is vacant is laid off into fancy paths and walks.

Then there are thick bunches of Grapevines running over arbors loaded with hanging clusters of Grapes, and Fig-trees more than thirty feet high loaded with ripening fruit. Then there are profusions of Plums, Apricots, Pears, Peaches, Oranges, Nectarines, etc., all delicious.

There are the Cedar of Lebanon, Magnolia, Olive, Laurel, Hibiscus, Gardenia, Oleander, and Palmetto, looked in each other's embrace, and gayly holding blossoms in their hands; and creeping up among them are the Cactus, the Jasmine, the Passion Vine, the Honeysuckle, the Bignonia, the Lantana, and the "Plumbago," unfolding their tinted and sweet-scented buds to entice, while they stealthily entwine their long tendrils around the arms and bodies of the flowering trees, binding them into arbors that exclude the rays of the sun and the gaze of the world, where a poetic young man and a romantic young woman might repose on a green, mossy bank, and forgetting the world, fancy they were in the Garden of Eden.

MARKET-GARDENS OF HOLLAND.

In the neighborhood of Amsterdam, Holland, writes a correspondent of the *London Garden*, there are over one hundred and fifty market-gardens, in the greater portion of which such kinds of vegetables as it is usual to forward under glass are grown, while some are devoted exclusively to Beans, Cabbages, and other things commonly cultivated as field crops. The Dutch market-gardeners are a laborious, painstaking class, but, seldom journeying far from home, are wedded to old ways, some of their appliances being of a very primitive description.

Thus, for instance, the sashes of their frames are glazed with small squares bedded in lead, just like the old-fashioned casement windows, a fact which seems most strange, seeing that that style of glazing garden frames has for many years been quite obsolete in European gardens generally. The frames themselves are of a rough description, being formed of thick boards, being generally some eighty feet long and divided into compartments at need.

Where ground is so valuable, space is naturally economized as much as possible, there being but about one and a half feet between each row of frames. Each market-garden is surrounded by hedges, and divided into two or several portions by screens or transverse hedges. In a level country like Holland, where there are but few natural breaks to the fury of the winds, some such kind of artificial protection is almost indispensable, and especially where a large number of glass frames are employed. One or more of these compartments are occupied by the dwelling-house, sheds, cellars for vegetables, and frames; the remainder are devoted to the various kinds of crops which may be made a specialty of.

Rural Life.

TO A LITTLE SUMMER VISITOR.
Written for THE AMERICAN GARDEN.

Amid spring's fair and tender green,
On branch and swinging spray,
The little birds made melody,
And cheered my heart all day.

But when the summer Roses bloomed,
And fragrant was the air,
Oho "birdie" came, whose dainty note
I deemed of all most rare.

Each morn I listened for his song,
As swift the weeks flew by,
And dearer to my heart he grew
As drew the autumn nigh.

But now November winds are drear,
And frosty is the air;
I miss the bird-song from the trees,
The swinging boughs are bare.

I miss my "birdie's" dainty note,
Our Highland home to cheer,
Yet hope assures its sweet return,
Beyond the winter drear.

M. L. B.

HIGHLAND PARK.

BUILDING AN ICE-HOUSE.

A country home without an ice-house lacks one of the principal means for comfort, and economy as well, during the summer months. Those who have never owned and managed such a structure generally look at it as something necessarily combined with considerable expense and labor. Yet this is not the case, as an ice-house sufficient for the needs of a large family can be built with but little cost. The following plan, given in the *American Agriculturist*, will probably meet the wants of many of our readers:

The locality selected was one affording facilities for drainage, was well shaded by trees, and conveniently near the house. The surface being sandy was leveled, and 4 x 6 inch sills, fourteen feet long, were laid down and halved together at the corners. The plates of the same length, of 2 x 4 inch stuff, were put together in the same manner. Studs 2 x 4 and thirteen feet long were mortised into the sills and spiked to the plates every eighteen inches. The roof, a "square pitch," is covered with ten-inch boards, two inches apart, and other boards of the same width nailed on as battens. Hemlock boards, nailed horizontally on both sides of the studs, cover the sides and ends, the four-inch space between the outer and inner siding being filled with sawdust or finely cut straw.

There is a door at the ground level, and another just above, both being practically double by means of horizontal boards, placed on the inside as the house is filled. The roof projects over the sides about a foot, and the spaces between that and the plates are left open to afford ventilation. A layer of sawdust, four inches or more thick, was laid upon the ground, and the blocks of ice stacked upon it as closely as possible. The top of the ice is covered with a layer of marsh hay, about two feet thick. This house, if filled up to the roof, would hold about sixty tons. When half filled, there has been a considerable quantity of ice left over each year, though it has been used very freely.

Exhibitions & Societies.

NEW-YORK HORTICULTURAL SOCIETY.

The "Chrysanthemum Show," held on the 5th and 6th of last month, proved a greater success even than that of last year. The untiring efforts of the exemplary secretary, J. Y. Murkland, were to be seen everywhere; they were well rewarded, and deserve high credit. The entire arrangement was tasteful and appropriate, every available space being filled with plants and flowers, while crowds of appreciative visitors filled the hall from the moment the doors were opened till their closing.

Messrs. Hallock & Thorpe reaped, of course, the lion's share of the premiums, and deservedly so; for the skill, labor, and expense required in the production of their exhibits must have been something extraordinary. The magnificence of their exhibits was certainly never equaled in this city. They had in all between three and four hundred named varieties of Chrysanthemums. The next largest professional exhibitors were W. C. Wilson and Peter Henderson.

A most pleasing feature of this exhibition consisted in the active interest taken by amateurs. John Farrell, gardener to Mr. William Barr, Geo. Lucas, Geo. Mathews, Chas. E. Parnell, and others made highly creditable exhibits. The specimen standards of John Farrell were models of perfect form and good cultivation. To see these alone would have been worth a good journey. They averaged about six feet in height, and were certainly not less beautiful and attractive than standard Roses. The prize collection comprised: *Grandiflorum*, *M. Planchenau*, *Striata perfecta*, *Bend Or*, *Lord Beaconsfield*, and *Fantaisie*. The best single specimen standard, *Elaine*, stood seven feet high, with a crown four feet in diameter, resembling a huge bunch of Daisies; but a better white in the same collection was *Melanie*.

It would far exceed the space at our command to describe, in outline even, all the fine exhibits. We must, therefore, confine ourselves to the naming only of the varieties composing the prize collections of cut flowers, which may serve as a guide to those intending to make a selection.

The best twelve new varieties of all kinds from Hallock & Thorpe comprised *Mad. Deville*, *Julius Scharff*, *La plume d'or*, *Mr. W. Barr*, *M. Moynet*, *Earl of Beaconsfield*, *Pres. Lavalec*, *Rosea superba*, *Lincomparable*, *Mrs. S. A. Nutt*, *Mrs. R. Pratt*, *Blanche neige*.

The best amateur collection of cut flowers came from Dr. Walcott, of Cambridge, Mass., and consisted of the following: *Mrs. Forsyth*, *Golden Queen*, *Nil desperandum*, *Prince Alfred*, *Crimson King*, *Mrs. Sharpe*, *Princess Teck*, *Abbé Passaglia*, *Mrs. Gladstone*, *Le Grand*, *Guernsey midget*, *Lord Wolseley*.

AMERICAN INSTITUTE CHRYSANTHEMUM SHOW.

To describe this grand exhibition, held at the Institute Hall from November 12th to 15th, would necessitate almost a repetition of the foregoing, as the principal exhibitors were the same, and the plants and flowers of equal excellence and beauty. But as this fine, spacious hall, with its many conveniences

and appointments, affords better means for display, the exhibits appeared perhaps to better advantage. Hallock & Thorpe, W. C. Wilson, and Siebrecht & Wadley were the largest exhibitors. Prominent in the amateur division were Geo. Mathews, C. M. Allen, Patrick Conroy, and N. Hallock.

Thousands of visitors were crowding around the tables and tastefully arranged groups, and to judge by the appreciative remarks of many, the interest in Chrysanthemums is not yet diminishing. In fact, comparatively few are aware of their possibilities; but these exhibitions exert a most healthful and refining influence upon our people in developing and educating a taste for flowers and their culture.

NEW-YORK FARMERS' CLUB.

This association, which for a quarter of a century has exerted more influence in developing progressive agriculture than any similar institution in our country, is about to be reorganized. Most of the older members who in former years have contributed to the usefulness and fame of the club, as well as a large number of prominent younger farmers and horticulturists, have taken an active interest in this reorganization, making its success already assured. The meetings will be held at 1.30 P. M. on the second and fourth Tuesdays of each month, at the rooms of the American Institute, Cooper Union. All ladies and gentlemen interested in agriculture or horticulture are invited to attend.

MISSISSIPPI VALLEY HORTICULTURAL SOCIETY.

The sixth annual meeting of the above-named society will be held in the city of New Orleans, commencing January 14, 1885, and continuing four days.

It is scarcely necessary to say more than this to arouse the enthusiasm of horticulturists everywhere, for it is already understood that this meeting is to be held during the World's Industrial and Cotton Centennial Exposition, and in connection with the greatest display of horticultural products ever made.

No horticulturist can afford to miss this meeting. A programme worthy of the occasion will soon be published. Liberal railroad rates are offered, and already special excursions, both by boat and rail, are being organized. Premium lists of the Horticultural Department of the Exposition will be furnished on application to W. H. Ragan, Secretary, Greencastle, Ind.

MICHIGAN HORTICULTURAL SOCIETY.

The annual meeting of this society will occur in Ann Arbor, December 1st, 2d, and 3d. Reduced rates on all Michigan railroads. A full and interesting programme is announced, a large attendance is expected, and all will be hospitably entertained. All those intending to be present should notify the secretary, *Mr. Charles W. Garfield*, Grand Rapids, Mich., that he may mail them railroad certificates. This will be an admirable time to visit the State University, and Ann Arbor horticulturists unite in a most cordial invitation to every member of the State and branch societies to attend. State and district societies outside of Michigan are invited to send delegates.

OUR BOOK TABLE.

The Jersey World, Indianapolis, Ind., presents itself among our exchanges. As its name indicates, its hold is "the Jersey World," and any one interested in this peerless breed of cattle can hardly do without this excellent weekly publication. It is very neat in appearance, and edited with remarkable care and mastery of the subject. A series of articles on the different kinds of cheeses of the world, and the modes of their manufacture, from the pen of Dr. A. S. Heath, associate editor, is of special interest, and full of valuable information for every one engaged in dairying.

Godey's Lady's Book for December (J. H. Haulenbeck & Co., Phila.) contains one of the prettiest steel plates that have ever been issued with the Magazine. "Sleeping Love" is really a work of art much above the par of ordinary engravings such as accompany the average periodical. The same might be said of the other illustrations in the book, all of which indicate good taste and a liberal policy in the management of the Magazine.

During the coming year the literary attractions of Godey's Lady's Book will be largely multiplied. The Two Hundred Dollar Prize Story will appear in the January number, which will also be accompanied by a Christmas card and several special features. The Magazine has never done so much for its subscribers as it is doing now, and the large increase in its patronage is well deserved.

Wheat Culture, How to double the yield and increase the profits, by D. S. Curtis. Published by the Orange Judd Company, New-York. Price, 40 cents. The importance of the Wheat crop as a source of revenue to the country has induced the publication of this pamphlet, the principal object of which is to teach farmers how they may increase their crops and improve their lands. The author, than whom there are few more familiar with this subject, has sifted and here brought together in a small space an immense amount of valuable information, thus supplying a seriously felt want, that of a condensed yet comprehensive manual of practical wheat-growing. Perfect Drainage, Deep Cultivation, Alkaline Matter, Clever and Plaster Rotation, Careful Selection of Seed, Cultivating and Early Harvesting, the author considers the requisites essential to produce increased yield of Wheat and continued good crops.

The Health Miscellany.—This is the title of an illustrated octavo pamphlet, published at twenty-five cents, by the Fewler & Wells Co., 753 Broadway, New-York. It contains a series of papers devoted to important health topics, opening with an excellent article on the External Senses, with illustrations of the eye, ear, nose, tongue, and skin, giving important information in regard to the functions and also the care of these important organs of the body. The next is an illustrated article on the Cause and Cure of the Backache, especially found among so many women. A chapter on Ethnology is illustrated with a number of portraits showing the races of men. A very important paper is one devoted to Bodily Position and Dress in relation to health and form. The Teeth, their use and care, containing illustrations showing how the teeth are formed and grew, why and how they decay.

Many other hygienic topics upon which the people need educating are intelligently discussed in this pamphlet, the reading of which is amply worth its small cost.

Edwin Alden & Bro's American Newspaper Catalogue, Cincinnati, O.—This large, elegantly gotten up volume of nine hundred pages contains lists of all Newspapers and Magazines published in the United States and the Canadas; together with the Population of the Cities, Towns, Counties, and States in which they are published; their Politics, Class, or Denomination, size, and estimated Circulation. Also Special Lists of Religious, Agricultural, the various Class, public, and of all Newspapers published in foreign languages; and a list of all Newspapers and Magazines in the United States and the Canadas by Counties. The whole especially arranged for the convenience of advertisers.

The number of newspapers and magazines published in the United States and the British American Provinces, as herein catalogued, is: Total in the United States, 14,111; in the British American Provinces, 691. Published as follows: Dailies, 1357; Tri-Weeklies, 71; Semi-Weeklies, 169; Sundays, 205; Weeklies, 10,975; Bi-Weeklies, 39; Semi-Monthlies, 288; Monthlies, 1502; Bi-Monthlies, 26; Quarterlies, 83. These statistics show an increase in the total number of papers this year over last of 1822. The introductory chapter on the Science and Art of Advertising contains many valuable hints, and is full of information useful to every advertiser.

How the Farm Pays: The Experiences of Forty Years of Successful Farming and Gardening, by William Crozier and Peter Henderson. Published by P. Henderson & Co., New-York. Price, handsomely bound in cloth, \$2.50.

This large octavo volume of four hundred pages, richly and excellently illustrated, and elegantly finished in every respect, is the result of the "happy thought" of the authors to lay before the world their life-long experiences in farming and gardening, not in the usual form of treatises, but in an easy colloquial or conversational style. No one can read a few pages of this work before becoming impressed of the great advantage of this method. One becomes involuntarily drawn into the conversation, and while listening to an answer or explanation, another question suggests itself to the reader, the same probably which soon follows in the book.

Both authors are so well known in the agricultural and horticultural world that it will hardly be necessary to state that the entire work is eminently practical, concise, and brimful of useful information and advice, of value to every one engaged in the cultivation of the soil. No one can read the work without feeling amply repaid for its cost, and the time devoted to its perusal; and no one who commences it will lay it aside before having read every page, so pleasing and attractive is its style.

We cannot refrain from quoting the following admirable remarks of Mr. Crozier, which, if they could be printed in golden letters before the vision of every city-bred man longing for the delights and profits of farming, how many fortunes could be saved, how many sad disappointments avoided. Farming can only be made to pay by those who know how. "No man," says Mr. Crozier, "should attempt farming or gardening, in the hope of making it a profitable business, unless he is willing and able to take hold with his own hands, and employ his own brains in the work. Many educated city people delude themselves with the belief that their want of knowledge of rural affairs will be more than compensated by their advantages of education and business experiences, when they conclude to engage in farming. This delusion draws hundreds from the city to the farm to their ruin every year. The only true way for a man who has previously been engaged in other business, and who wishes to become a farmer, is to get the privilege of taking active hold of the work, under the instruction of some farmer who has made the business a success. I do not, of my own knowledge, recall a single instance in which so-called gentlemen farmers have ever received their original investment back, although many of them, having competent overseers, are handling their fancy stock in a manner which, if energetically followed up as a business, ought to pay them nearly as well as us farmers who have to make our living by it."

To this, Mr. Henderson adds: "With all our care in selecting young men who come to learn the finer parts of horticulture, not more than one in ten ever attain to any prominence, and such usually develop superiority from the first."

The chapter on "Training for the Business of Farming" is followed by discussions on Manures and the Modes of Application, Plowing, Harrowing, and Cultivating, Rotation of Crops, Crops for Soling and Fedder, Grass and its Management, Cutting and Curing of Hay, Live Stock on the Farm, Pests of the Farm, Farm Machinery, etc.; Vegetables and Fruits, descriptions of the leading varieties and their culture, are treated in separate chapters by Mr. Henderson, with a special view as to their management on the farm and in the market garden. All the latest improvements in methods and varieties are here brought

to the notice of the reader, making the work of much value not only to the farmer and market gardener, but to any one interested in the cultivation of fruits and vegetables.

ANSWERS TO CORRESPONDENTS.

Dandelion Culture.—H. M. S., Savannah, Ga.—Dandelion is raised from seed sown as early in spring as possible. The seedling plants are kept cultivated during summer, and in the fall taken up and transferred to frames or greenhouses, where they may be forced as desired during winter. The earlier they can be brought to market the better. The young leaves are the part used, for salad principally. The dried roots used in the preparation of medicines are imported from Europe at a lower cost than they could probably be grown here with profit.

Top-dressing Lawns.—M. F., New Haven, Conn.—Well-decomposed barn-yard manure makes the best top-dressing for a lawn. If put on now its fertility will seep in the ground during winter, and the loss from evaporation is so small as to be hardly worth considering. Coarse, fresh stable manure is, although better than none at all, objectionable on account of the untidy appearance it gives the place all winter, and in spring all the litter has to be raked off again. Of concentrated fertilizers, fine bone-dust produces the most permanent benefit.

Potato Scab.—N. C., Roxbury, Mass.—"What causes scab in Potatoes?" Don't know! Why will people insist on asking questions that nobody can answer? Wireworms, grubs, Potato beetles, and what not will eat holes into Potatoes; but these are not scab. According to our present knowledge scab is caused by some minute animal or vegetable parasites which attack some varieties in preference to others, and are more disastrous in ground fertilized with stable manure than when commercial fertilizers are used.

CATALOGUES RECEIVED.

J. T. Lovett, Little Silver, N. J.—A beautiful colored plate of the new Grape Jessica, with numerous testimonials as to its value as an early, hardy white Canadian Grape. Mr. Lovett is the sole agent for the United States.

V. H. Hallock, Son & Thorpe, Queens, N. Y.—Catalogue of Bulbs and Plants, containing a full list of all the best spring-flowering bulbs, also Lilies and other bulbous plants. A great number of illustrations, and an excellent introductory article on "Flowers of Spring," by Mr. John Thorpe, gives special value to this catalogue.

A Great Expense Saved in buying a farm in Michigan. It is not necessary to transport heavy or bulky material any great distance. Agricultural implements adapted to the soil, and household goods can be purchased here as cheaply as in the Eastern and Middle States. Cattle and horses need not be brought unless of a superior class, as good horses and cattle can be purchased for much less than they can be landed here; besides, Michigan farmers find a market for the products of their lands right at their doors. Write to Hon. O. M. Barnes, Lansing, Mich., for particulars.

MUSICAL.

From the Boston Evening Traveller.

The Knabe Piano, which has such a wide popularity, is considered by many experts to be superior in every way to any other Piano in the world. The success of this Piano has only been attained by years of careful study, and the Knabe, with its excellent singing qualities, its great power, the elasticity of touch, and superior workmanship, is justly the favorite. Herr Faellen's piano solos at the recent Worcester festival, the Schumann's concert, in A minor, op. 54, and Liszt's Rhapsodie No. 4, which were so highly praised, were both performed upon a Knabe Piano, Herr Faellen pronouncing it to be the best Piano he had ever seen.

**YOUR
SUBSCRIPTION HAS EXPIRED.**

Please renew early. Why not to-day? Several thousand subscriptions expire with this issue, and your prompt renewal will save us much work and expense. Why not ask your neighbor to let him send his subscription along with yours? Please see the October GARDEN for seed and plant premiums, and list on this page for club rates with other publications. THE AMERICAN GARDEN for 1885 will be better worth your \$1 than ever before.

**ANNOUNCEMENT OF CHANGE OF OWNERSHIP
OF THE AMERICAN GARDEN.**

NEW-YORK, December 1, 1884.

To our Readers:

In announcing the change of proprietorship of THE AMERICAN GARDEN, we do so with feelings mingled with regret as well as pleasure.

During the past five years of its ownership, we had the satisfaction of seeing the journal grow from a small beginning to its present influential position and become a recognized authority on all horticultural subjects. That we are now prompted to relinquish its publication is a matter of sincere regret; but illness of our junior partner, — necessitating a residence in a milder climate, — upon whom devolved its principal management, makes such a step unavoidable.

THE AMERICAN GARDEN passes now to the hands of Mr. E. H. Libby, whose enterprise and extensive experience offer ample assurance that our readers can only derive benefit from the change; and as the editorial part will, as heretofore, remain under the charge of Dr. F. M. Hexamer, the excellence and high character of the paper will be fully maintained.

In thus taking leave of our readers, we feel assured that while the change relieves us from much arduous work, it cannot but result to their benefit.

B. K. BLISS & SONS.

The new publisher makes his bow with pen in hand, and says to all genial horticulturists:

NEW-YORK, December 1, 1884.

Kind Friends of THE AMERICAN GARDEN:

We have no trumpet to sound, and only promise that we shall try to make your magazine as worthy of your patronage as it has been in the past, and as much better as the degree of coöperation you give. It will permit. It now becomes an independent magazine of general horticulture. Messrs. B. K. Bliss & Sons have given you a beautiful work of art, and have well deserved your support.

But you have only half believed that the magazine was impartial. Now you have no reason to doubt, for we have nothing to sell. If you will second our efforts with subscriptions and advertisements, we will do our part toward making a helpful, valuable, special journal of your interests.

Yours horticulturally,
E. H. LIBBY, Publisher.

The January number of the AMERICAN GARDEN will contain an announcement of our plans and contributors for 1885.

**ARE YOU READING ANYTHING?
THE AMERICAN GARDEN**

In club with other publications.

If you want any of the following leading publications for 1885, we will send them in club with AMERICAN GARDEN for the prices named in the last column. This offer is good for both new and old subscribers. And all club subscribers are also entitled to the seed and plant premiums offered in the October number of the AMERICAN GARDEN.

A. Publisher's price for both.
B. Our price for both, including seed premiums of The American Garden.

ANSWERS TO CORRESPONDENTS:

Prickly Comfrey.—S. H., *Indianola, Tex.*—“What is it good for?” Up to within a short time the only living things we could induce to eat the leaves were ducks confined to a yard. They devoured them greedily, and a few clumps near the inclosure furnished a welcome supply of green fodder for them the greater part of the year. Ever since the introduction of the plant, some ten or twelve years ago, we have offered it to every horse and cow we had on our farm, not less than a hundred in all, without being able to make them eat it. But now we have a horse—a young, bright, spirited one, too—that will eat the green leaves with as much relish as we can supply. This discovery was a great surprise to us, as we had almost made up our mind that Prickly Comfrey was an unmitigated nuisance in a place; but after this experience, we are forced to modify this opinion.

Seeding Meadows.—A. C., *Atlanta, Ga.*—The usual way of seeding meadows is to sow Timothy

with Wheat or Rye in the fall, at the rate of eight to ten quarts per acre; and, in the spring, to sow on the same ground about ten pounds of Red Clover. If the hay is grown for sale, Timothy sells better than any other; but it to be used on the farm, a mixture of grasses will generally be found more profitable. Mr. William Crozier uses as many as ten varieties together, with a due proportion of Clover. His favorite mixture consists of one-half of the bulk in Orchard Grass, and the other half made up of Meadow Foxtail, Sheep Fescue, Rhode Island Bent, Hard Fescue, Sweet Scented Vernal, Meadow Fescue, English Rye Grass, Italian Rye Grass, and Red Top.

SEED Warranted to Grow.

or order refilled gratis. I have sold vegetable and flower seed to over
a million farmers and gardeners in the United States, perhaps some
are your neighbors, if so ask them whether they are reliable. Mr.
Thomas Henshall of Troy, Kansas, writes me: "For 26 years
I have dealt with you. I have lived in Iowa, Missouri, Colorado,
and Kansas, and no matter what the soil or climate, the result
was always the same, to wit - religiously, honest and
good." This is the kind of seed I raise and sell. Besides
dealing in all the standard varieties, I carefully test every year
hundreds of new vegetables and catalogue the few that prove to be
really desirable. The Hubbard and Marblehead Squash, Marble-
head Corn, Marblehead Cabbage, Ohio Potato, Eclipse Beet,
all of which I was the original producer, are some of them. My Catalogue
for 1885, sent free to all.

JAMES J. H. GREGORY, (Seed Grower), Marblehead, Mass.

THE "PLANET JR" HOLLOW STEEL STANDARD NEW HORSE HOE.

As lately introduced, has no equal in the world. Its excellent work in the field has displaced that of all competitors. It is in some sections, doing in one passage, the work of four or five old-style implements, and in others superceding the cumbersome and expensive two-horse tools. The "PLANET JR" HAND SEED-DRILLS AND WHEEL HOES are the newest and best, lightest and strongest known. There are 7 distinct tools, each with special merits, no two alike or the same price; all practical and labor-saving. Let no Farmer or Gardener fail to study up during the winter evenings our 1885 CATALOGUE, which gives reduced prices, careful and exact engravings of these different machines, and such descriptions as will enable the reader to judge correctly of their merits. Thirty pages and Forty engravings. Free to all. Correspondence solicited.

LOOK! ONLY 14 Cts for 3 French Dolls WITH AN ELEGANT WARDROBE OF 32 PIECES.

BEST and CHEAPEST

CHRISTMAS IS COMING.

Consisting of Reception, Evening and Morning Dress, Bonnets, Street Costumes, Coats, Hats, Hand Satchels, Sun Umbrellas, Music Portfolios, Overcoats, Suller Suits, Military Suits, Goggles, Dress Suits, etc. These Dress and Suits in this elegant Wardrobe represent Nine Different Colors, and they are lovely Paris. There is One Little Boy and Two (Two) Dolls in each set with Pretty Faces and Life-like beautiful Features, and they dress them in their different Suits. Every Child and mother that has seen them go in raptures over them, and every will get more real enjoyment out of a set of these French Dolls than out of articles that cost \$10. A lady writes us that her Little Boy and Girl played for five long hours with a set of these French Dolls, and they felt very sorry indeed to think that they must stop and eat their supper, and if mother only knew how much amusement there is in these dolls they would willingly pay double the price asked for them. Sample set consisting of three dolls, for 22c, 12 sets for \$1, you get \$1.00 25 sets for \$2, you get \$3.75 over \$50 a week. If you need for one or two sets in one day, you get \$1.00 Method and Full Directions how you can make more than \$100 a month out of these dolls. If you have not the money now but this one set will not appear again before Christmas, and it is an opportunity too valuable to lose. Postage stamps taken. Address United States Co., Hartford, Conn.

MICHIGAN FARMERS 300,000 Acres ORCHESTRAL PIANO-ORGAN.

Find the best markets in the world right at their doors. Blizzards and tornadoes do not devastate their crops and ruin their homes. I have for Sale. Easy payments; long time; low rate of interest. O. M. BARNES, Lansing, Mich.

A NEW INSTRUMENT.

SWEET AND POWERFUL.

SIX OCTAVES.—Size: Height, 4 ft. 5 in.; Length, 4 ft. 8 in.; Depth, 2 ft. 3 in.

THE CASE is a beautiful design of an Upright Piano, exactly like illustration, manufactured of solid Cherry, ebonized and highly polished. THE MUSIC is produced upon TWELVE OCTAVES of Reeds, (aided by a double Right and Left Coupler), so constructed, tuned and voiced as to imitate as nearly as possible a stringed instrument, operated by a full SIX OCTAVE compass of Keys. This instrument excels all others in elasticity of touch, and THE MOST RAPID MUSIC CAN BE PLAYED with perfect ease. It responds at once to the touch, combining an easy action with QUICKNESS OF ARTICULATION. The tone is smooth, full and rich, not harsh nor ear-piercing. IT IS THE BEST ACCOMPANIMENT FOR VOCAL MUSIC, being subordinate to the voice, instead of covering it up, and the tone is pure and flexible. The instrument can be played with perfect ease by ladies, as the pedals (a new invention for which application for patent has been made) are operated without exertion, in a perfectly natural position. Adjustable additional pedals for children are sent with every instrument. Knowing this Piano-Organ will please the public, we are determined to introduce it all over and make the following offer:

\$95 If you will remit \$95.00, within one month from the date of this Magazine, by Draft Post Office Money Order, or by Express prepaid, we will ship you this instrument, with adjustable stool and book, IMMEDIATELY ON RECEIPT OF ORDER. Test trial given and money returned if instrument is not just as represented and perfectly satisfactory. The regular price of this instrument, as compared with other manufacturers, could not be less than \$145. Visit the factory and select, or order by mail and mention this Magazine. \$145

We recommend this instrument because we know its merits, but we keep in stock and SHIP PROMPTLY on receipt of order, all our different styles of Organs for the Parlor, the Chapel, the Church or the Sabbath School. Pianos for \$20 and upwards. Send for Illustrated Catalogue. Visitors are always welcome at this mammoth factory. Address or Call upon

W. P. HADWEN, Manager, Daniel F. Beatty Organ and Piano Co., WASHINGTON, NEW JERSEY, United States of America.

THE POULTRY MONTHLY CONDUCTED BY T. M. FERRIS. Best Magazine of its kind. \$1.25 per year. Sample copies, 12c. Address FERRIS PUBLISHING CO. 481 Broadway, Albany, N. Y.

Publ's Home Guard, Hartford, Conn.

THE CENTURY FOR 1885.

A GREAT ENTERPRISE.

THE important feature of THE CENTURY MAGAZINE for the coming year—indeed, perhaps, the most important ever undertaken by the magazine—will be a series of separate

PAPERS ON THE CIVIL WAR,

written by general officers high in command either upon the Federal or the Confederate side. The battle of Shiloh and the siege of Vicksburg will be among those described by General U. S. Grant; General Beauregard writes of the First Bull Run; Generals McClellan, Rosecrans, Longstreet, Hill, Fitz John Porter, Pleasonton,

Gordon, Admiral Porter and many others have engaged to contribute. Papers chronicling special events, personal reminiscences of prominent military leaders now dead, brief sketches entitled "Recollections of a Private," descriptions of auxiliary branches of the service, etc., etc., will supplement the more important series by the various generals.

A strict regard for accuracy will guide the preparation of the illustrations, for which THE CENTURY has at its disposal a very large quantity of photographs, drawings, portraits, maps, plans, etc., hitherto unused. The aim is to present in this series, not official reports, but commanding officers' accounts of their plans and operations,—interesting personal experiences which will record leading events of the war, and possess, at the same time, a historical value not easily to be calculated.

OTHER FEATURES

include a new novel by W. D. Howells—the story of an American business man; novelettes by Henry James, Grace Denio Litchfield, and others; short stories by "Uncle Remus," Frank R. Stockton, H. H. Boyesen, T. A. Janvier, H. H., Julian Hawthorne, and other equally well-known writers.

There will be an important series of papers on the New North-west; articles by W. D. Howells on "Tuscan Cities," illustrated with reproductions of etchings by Pennell; papers on Astronomy, Architecture, History, Sanitary Drainage, etc., etc.

Readers of THE CENTURY may feel sure of keeping abreast of the times on leading subjects that may properly come within the province of a monthly magazine. Subscriptions should date from November, beginning the War Series and Mr. Howells's novel. Price, \$4.00 a year; 35 cents a number. All book-sellers and news-dealers sell it and take subscriptions, or remittance may be made to the publishers.

A free specimen copy of THE CENTURY will be sent on request. Mention this paper.

THE CENTURY CO. New-York, N. Y.

Manual of Etiquette, for ladies and gentlemen, a guide to politeness and good breeding, giving the rules of modern etiquette for all occasions. 2. The Standard Letter Writer, for ladies and gentlemen. A complete guide to correspondence, giving plain directions for the composition of letters of every kind with innumerable forms and examples. 3. Winter Evening Recreations, a large collection of Acetg Charades, Tableaux, Games, Puzzles, &c., for social gatherings, private theatricals and evenings at home; illustrated. 4. Dialogues, Recitations and Readings, a large and choice collection for school exhibitions and public and private entertainments. 5. Parlor Magic and Chemical Experiments, a book which tells how to perform hundreds of amusing tricks in magic and instructive experiments with simple agents. 6. Sixteen Complete Stories, by popular authors, embracing love, humorous and detective stories, stories of society life, of adventures, of railway life, etc., all very interesting. 7. Fancy Work for Home Adornment, an entirely new work upon this subject, containing easy and practical instructions for making fancy baskets, wall pockets, brackets, needle work, embroidery, etc., etc., profusely and elegantly illustrated. Cut this out and name paper. Address **E. G. BABCOCK & CO., CENTERBROOK, CONN.**

50 CARDS all perfumed, New designs, little beauties, Gold Chromo, Verses, Mottoes and Hidden Name, with an elegant prize, 10c. Ivory Card Co., Chittouville, Ct.

FREE! A Gold Watch. FREE! GOSSAMER GARMENTS. CARDS

The proprietors of the largest card manufactory in Connecticut wishing to introduce their Agents' Sample Book into every home at once, make the following liberal offer: The person telling us the longest verse in the Bible before Jan. 1st, will receive a **Solid Gold, Lady's Watch worth \$50.** If there be more than one correct answer, the second will receive a **Stem Winding, Gentleman's Watch worth \$25.** Each person competing must send 75c with their answer for which they will receive 2 Lady's Waterproof Gossamer Garments, 1 pack Hidden Name, All Embossed, Bird Motto and Chromo Vignette Cards with their name on each card, our New Agents' Sample Book, and a Premium List of 100 new styles of cards. **CAPITOL CARD MFG. CO., Hartford, Conn.**

A LOVELY CHRISTMAS GIFT.

Every Christmas we make the little folks a Christmas Present. This year we have something nice and pretty. To introduce our goods in every home we will send to any boy or girl free of charge, if you will send 20c. for postage, &c., 3 pretty Dolls with beautiful life-like features, pretty curls and blue eyes or long and dark eyes, and wardrobe of 32 Dresses, Hats, &c. one elegant gilt-bound floral Autograph Album illustrated with birds, ferns, scrolls, &c., five lovely Christmas Cards, one pretty Birthday Card and a 50p. illustrated Holiday Book. **ACME MFG. CO., Ivoryton, Conn.**

KNABE PIANOFORTES.

UNEQUALED IN Tone, Touch, Workmanship and Durability. **WILLIAM KNABE & CO.** Nos. 204 and 206 West Baltimore Street, Baltimore; No. 112 Fifth Avenue, N. Y.

The American Garden

A Monthly Journal of Practical Gardening.

Dr. F. M. HEXAMER, Editor.

Vol. VI.
Old Series, Vol. XIII.

JANUARY, 1885.

No. I.

THE OPENING YEAR.

Seasons come and go without any sharply defined lines, so that except in the calendar, one hardly notices the end of one and the beginning of another. But a new year brings with it something that arouses our activity, and stimulates the mind of even the most utilitarian nature more than any other event.

The old year, closing with its Christmas festivities, its days of joy and merry-making, its season of goodwill to all mankind, makes room for the new, and it is now eminently proper to review past successes and failures, and to consider how to improve upon the former, and how to avoid the latter in future. Indeed, time cannot be devoted to better advantage at this season than to carefully delineate and mature our plans for the future, based upon the results of past experiences.

While our gardens are covered with snow, and outdoor plants are taking their winter rest, the lengthening days are already reminding us of the approaching spring. The wise gardener is never idle. He will even now find plenty to occupy his time, not merely in selecting and providing seeds and plants, and other material that may be wanted, but in cultivating the garden of his mind, and by stocking it with the best and most reliable information obtainable from all sources.

In this connection we wish to remind our readers that the AMERICAN GARDEN stands ever ready to furnish all friendly advice and information within its means, that it will gladly answer all inquiries about horticultural topics, and will always make it its

highest aim to be considered a welcome friend in their homes as well as their gardens.

Horticulture as a means of education is rapidly becoming more and more recognized; the refining influences of tastefully planted and neatly kept grounds are apparent to every observer; and the lasting, beneficial

chief missions of true Horticulture. May the year upon whose threshold we just step extend its realm to every home; may it bring a rich harvest of fruits and flowers, and a richer still of health, happiness and content to every member of our great "GARDEN" family, to every one of whom we sincerely wish a HAPPY NEW YEAR.

THE GARDEN VS. THE BENT.

With proper management, and under favorable conditions, an acre of ground can often be made to produce larger profits than many a hundred-acre farm slovenly conducted. Experienced market gardeners near large cities are proving this every year; but it is not practical gardeners only that raise large crops from comparatively small areas. We have in mind a professional man, who, by spending his leisure hours in his garden of about a quarter of an acre of ground, raises nearly all the vegetables used by his family. We know of several other instances in which the products of the garden pay a considerable part of, if not the entire rent of the land as well as the home.

Less land and better tillage is the great need of progressive gardening and farming. How much toward the rent can the amateur gardener raise in his garden, is a question foremost in the minds of many who contem-

plate to change the city tenement life for a home in the country. If any of our readers solve this problem, please let us know: "How the Garden Paid the Rent?"

For Prospectus and Publisher's Announcements, see pages 14 to 16. Look for presents to all our subscribers.

THE MONTH OF JANUARY.

A JANUARY SONG.

By H. G. Adams.

THE Old, Old Year is dead,
The snow lies on his bed,
The New Year has come merrily in, with a cheerful
sound of bells;
The wind blows sharp and keen
The naked boughs between;
There are no song-birds in the woods, no flowerets in
the dells.
Sing hey! sing ho!
As down the slide we go,
With laugh and shout that ringeth out upon the frosty
air;
Sing up! sing down!
Oh, leave the sloppy town,
The sports, the pastimes, and the joys, of country boys
to share.
The air is full of snow,
The cattle stand and low,
Knee-deep in straw, beside the barns and ricks all
rooted with white,
The huddled birds cry "Cheep!"
Beside the folded sheep,
Whose fleeces brown and dingy look where all is fair
and bright:
Sing hey! sing ho!
As down the slide we go.

impressions which attractive home surroundings have upon the mind of the young are plainly evident. The love of flowers is not a mere idle sentiment, but is deeply rooted in every pure mind. To direct and guide this fondness so as to become promotive of the greatest good, and to increase happiness and love of home, is one of the

The Vegetable Garden.

SEASONABLE HINTS.

As the prudent soldier in peace prepares for war, so will the provident gardener make now preparations for his contemplated garden. Next to outlining a complete working plan, and to securing all knowledge necessary in carrying it out successfully, the selection of the seeds needed for the purpose is most seasonable. This can be done now with more care and better discrimination than at any other time.

What to Select.—In vegetables as in everything else tastes differ. We heard once a gentleman express his preference for Marrow-fats over all other Peas, and we know several persons who detest mealy Potatoes. Each one must therefore be guided by his own likings and dislikings.

Some people, and not a few either, are constantly hunting for something new, and the first question they ask of the seedsmen is about the novelties of the season.

Novelties are, for once, exceedingly scarce this year, phenomenally so, which is a matter of congratulation, and may give novelty hunters an opportunity to convince themselves of the value of some of the older kinds.

Seedsmen get a good deal of blame in this matter of introducing novelties, deservedly so in some cases, but in many others without a particle of justice. A seedsmen who has an established business, and who has a reputation to lose, would not any sooner, knowingly introduce a worthless novelty, than he would let his note go to protest. But the laws of demand and supply are alike in all trades. As long as there are people who insist on having novelties in dry goods, or bonnets, or hats, or seeds, some one will furnish them.

Trying Novelties brings with it considerable fascination, as much so as investing in lottery tickets, and with the same degree of probability in getting back the investment. Yet there are some prizes in lotteries as well as in novelties. The most valuable standard varieties of vegetables of the present day were first introduced as "novelties" by some enterprising seedsmen.

The point we wish to impress most on our readers, in regard to making a selection of seeds, is that the lists of our older garden vegetables comprise already many varieties of the highest excellence, and that those who wish to experiment will derive probably more satisfaction by making themselves acquainted with some of the older varieties than by trying novelties. No one need expect to find much improvement over American Wonder and Champion of England Peas, Early Valentine and Refugee Beans, Egyptian Beet, Beauty of Hebron and White Star Potatoes, and many others long cultivated.

Quality in vegetables as well as in fruits depends not altogether upon the variety. As in animals it depends upon the "feed as much as the breed." A great part, the greater in fact, is owing to the conditions of soil, fertilizers and the mode of cultivation. Some kinds of vegetables are actually unfit for use unless they are grown rapidly and luxuriantly. To derive the full benefit and pleasure from the garden, one must study the requirements and needs of the plants.

POTATO FERTILIZER TESTS.

A knowledge of the special needs of our soils is one of the most important factors in profitable land culture. This knowledge however, is not as easily procured as it may appear to the casual observer, and it is only by carefully conducted, and oft repeated experiments that anything like conclusive deductions can be obtained. The results of the Potato tests with different fertilizers and with various combinations of them, made last summer by Mr. E. S. Carman, editor of the *Rural New Yorker* seem to us highly instructive and deserving the thoughtful consideration of every cultivator of the soil.

The soil of the plots selected was a worn out sandy loam, level, and naturally well drained. The seed had been cut several days previously, the White Star having been selected as, by its season of maturity, keeping qualities and vigor well suited to such tests. Potatoes of nearly the same size were cut in halves lengthwise, the seed end of each having been cut off and rejected. The seed conditions were made still more equal by using the same weight of seed pieces to each plot. Trenches had been dug several days previously, two spades wide and six inches deep, the trenches six feet apart so that the roots of one trench should not reach and feed upon the fertilizer of the adjacent trenches. Later two inches of soil were raked into the trenches and upon this the pieces—cut surface down—were placed one foot apart. Two inches of soil were raked over them, and the fertilizers applied.

Twenty-eight plots were planted, the kind and number of pounds of fertilizer applied to each, the relative growth of vines, the total weight of the yield, the total number of Potatoes and the number of marketable Potatoes being recorded in an admirably arranged table. Our space does not permit to give the entire list, but the following will show the most prominent results of these experiments:

Fertilizer applied:	Yield in pounds:
None,	133½
Di-solved bone-black,	163½
Nitrate of Soda,	17
Sniphate of Potash,	21
Nitrate of Soda, Dissolved bone-black and Sniphate of Potash,	20½
Yard manure, two years old,	30½
Mapes' Potato Manure,	35
Mapes' Potato Manure, Kalult and Hay Mulch,	47

As stated above, to insure accuracy, the rows were planted six feet apart, but there is no doubt that the yield would have been as good, if not better, had they been only three feet apart. Assuming the latter distance, the yield from the unmanured soil would have been 130 bushels per acre, while Mapes' Potato Manure would have produced 256 bushels per acre, an increase of 117 bushels, and Mapes' Potato Manure with Kaint and Hay Mulch produced 344 bushels per acre, an increase of 205 bushels over the unmanured ground.

"Many farmers who have tried plain superphosphates alone, raw bone alone, or potash alone, or any two, will see from our tests," comments Mr. Carman, "that they should not condemn so-called chemical fertilizers because any one, or even any two, should fail to give a marked increase of crop. If a soil needs all kinds of plant food, and is supplied with but one, no matter how

large the quantity may be, the crops will not be materially benefited. Thus it will be seen that in our careful tests, potash alone did no good. Dissolved burnt bone, which furnishes phosphoric acid only, did no good. Nitrogen increased the growth of the vines, which, for want of potash and phosphoric acid in the soil, gave no increase of tubers. But the complete fertilizers—those which furnish all three—gave an increase of crop in every case.

"Study this question, farmers and gardeners. It will pay you to do so. If you don't know what your land needs, use complete fertilizers until you find out. You can find out by making just such experiments as these.

"Plants, like human creatures, need a complete food, and if the soil does not supply it, we must feed the soil with the deficient element. If the soil from exhaustion needs every element, we must supply a complete food.

"We are not advocating the use of fertilizers at all—neither are we discussing the question as to whether, at their present price, we can afford to use them. We merely wish to show that they do furnish the constituents of food to plants the same as stable or farm manure or composts of leaves, muck, straw, or any other substance furnish them, and that we have but to supply the elements which our soil needs, to render it fertile."

PREPARING CELERY FOR MARKET.

When properly grown and bleached, and carefully prepared, Celery is not only a most delicious vegetable, but contributes an essential part to the decorations of the table; it has therefore to stand the test of sight as well as taste, the white or amber of the foot-stalk, shading into the green of the upper leaves, the firm, brittle quality of its substance from center to extremity, the agreeable nutty flavor heightened by proper cultivation are qualities sought both by producer and consumer.

Upon the proper bleaching process depends very much the value of the crop. An unbiased judgment will, I think, give preference to earth-bleached Celery, which comes into market after the middle of November. The early crop is generally affected by the heat; while the later is sometimes injured by the artificial bleaching, necessary to its preservation during the winter months. There are many ingenious devices for bleaching Celery, all aiming to dispose with the handling of so much earth; but, all points considered, the earth process is to my mind the best yet discovered.

Bleaching with sea weed is the favorite method along the coast of New England, and is that which gives the excellent flavor and color to the Boston Celery. Pit bleaching by the exclusion of sunlight and under a low temperature is effectual but not always very satisfactory.

My experience is that the Celery sold previous to the holidays; is the most profitable part of the crop that kept later is subject to so many losses by mice, flood, frost, rust and decay, that although the price by the dozen may be higher the average profits for one hundred roots, are no greater than in November.

It is possible to keep small quantities of Celery undisturbed in an equitable temperature for a considerable period, and

housekeepers who raise their own Celery have found this a convenient plan, but the gardener who supplies the market in competition with his neighbors knows the loss and damage to which Celery is subject in cold and snowy weather.

The form and size of the bunch varies according to usages of the market in which it is sold, and dealers must govern themselves accordingly. I have in mind an amateur that dug his Giant Celery from the trench with a pick-axe, took it unwashed in his wagon to market, with the outer leaves solid with frost, the inner ones badly covered with water blisters; consequently when brought into a warm room it was soon in ruins: had it been left in the trench till a warm, sunny day it might have been saved.

The outer leaves of the plant are always hollow, and should be taken off, the root trimmed into proper shape, the bruised or broken tops cut off neatly, and then washed. A brush with soft bristles, or a small brush-broom are best for this purpose, as they search all the crevices, removing every particle of soil. The washing should commence at the root, working towards the top, using tepid and not too warm water, which has a

CELERIAC.

tendency to destroy the structure of the leaves and to give them a withered appearance, handle and pack carefully to avoid broken stalks. In cold weather, hot bricks or a burning lantern placed in the box in which it is carried to market, will keep out frost and save the Celery.

In retailing Celery I have had the best success with small or medium sized bunches; or those that could easily be divided, for it is an acknowledged fact that two small bunches at twelve or fifteen cents each sell quicker than a large bunch at twenty-five cents.

W. H. BULL.

SOME RARER VEGETABLES.

In addition to the large number of excellent vegetables that we find in every good garden, several are named in our seed catalogues that we very rarely see in cultivation. Some of these rarer vegetables are little grown, because they are little valued. A few of them, however, are not found in our gardens, chiefly because their merits are not generally known. I mention here three vegetables which are very rarely seen in cultivation in this country, but which it seems to me, need only to be better known, to be appreciated by the public generally.

CELERIAC.

First, I mention the Celeric, or Turnip Rooted Celery. Although this vegetable is said to have been developed from the same wild plant as our common Celery, it is quite different from the latter in its manner of growth. The leaf-stalks are comparatively short and slender, while the root, instead of being simply a branching tap-root, like that

HAMBURG PARSLEY.

of our common Celery, is thickened into a large fleshy expansion, resembling the Turnip. In the more improved varieties, this bulb-shaped root is quite smooth and regular in form. Boiled until tender, and seasoned with milk and butter, and a little pepper and salt, the roots form an article of food, that is very palatable to many persons.

This vegetable is grown in the same manner as the common Celery, except that the plants require no hilling up. I have not tried sowing the seed in place, but I see nothing to prevent growing the crop in this way, if the seed were sown very early in the spring. I have started the plants in boxes in April, transplanting them to the garden early in July. They may be set out in rows

COMMON PARSLEY.

eighteen inches apart, spacing the plants six inches apart in the row. Keep the soil free from weeds, and the surface mellow during the season. Late in autumn, the plants should be taken up, and packed in sand in the cellar, where they will keep well during the winter.

Another vegetable not much known, is the Hamburg, or Turnip Rooted Parsley. This also seems to be the Common Parsley, with the root developed instead of the foliage. Indeed, it is comparatively, a modern vegetable. The thickened roots have not yet attained the symmetry or form of those of the Carrot and Parsnip, though a fair proportion of them are as regularly formed as the sample

shown in the cut. Cooked in the same manner as noted for Celeric, the roots are very palatable to those who like vegetables of this class.

The seed of Parsley is quite slow to germinate, and therefore failures often result from seed planted in the open ground. I have had excellent success, however, by sowing the seed in boxes, placing the latter in

the hot-bed of green-house, where they are regularly watered. Doubtless if watered frequently, the seed would vegetate as well in the open ground. I transplant the plants to the garden at the same time as those of Celery, in rows about eighteen inches apart. The after culture, and the storage during winter is the same as noted for Celeric.

FENNEL.

The third vegetable of the trio is, I think, still more rare in this country than are the other two. Indeed, I have never seen it except in my own garden, nor have I seen it mentioned in American catalogues. It is the Finocchio, or Florence Fennel. The foliage bears a close resemblance to that of the Common Fennel, but the broad flattened bases of the petioles are folded closely upon one another, forming a solid bulb-like expansion about three inches broad, and an inch and-a-half thick. This thickened expansion is the part used, and when cooked in the manner above noted, has a taste somewhat resembling that of Celery, but much more sweet. Tastes differ so much upon vegetables of the Umbelliferae class, that it is impossible to pronounce any of them as agreeable to all palates. The Florence Fennel is considered delicious by some persons, while it is unpalatable to others. The same is true of the Carrot, Parsnip, and Celery.

FENNEL.

It seems to thrive remarkably well in our climate, and is of very easy culture. Planted early in the spring, it was fit for use the first week in August. I started the plants in the same manner as those of the Hamburg Parsley, and the culture is the same, except that the thickened part of the root is covered with soil a short time before it completes its growth. I think it would answer as well, if not better to sow the seed in moist soil in the open ground, early in spring. It is strictly an annual plant, and yields its seed the first season. It is possible that by late sowing it might be grown so as to mature late in autumn, and thus be kept during a part of the winter.

"ELM."

[Fennel is offered by seedsmen among the "Herbs and Medicinal Plants."—Ed.]

JUDGING NEW VEGETABLES.

We know of no more pleasing experience in gardening than the testing of new vegetables on the table by the family. For several years we have cultivated many varieties of sweet corn, cucumber, lettuce, cabbage, carrot, potato, etc., both new and old; taken careful notes in the garden, and at the table notes were also taken of appearance, flavor and texture. These notes are kept, and are found to be of great value in selecting varieties for culture in subsequent seasons.

The Fruit Garden.

SEASONABLE HINTS.

Pruning in Winter when the wood is frozen may sometimes produce injurious results, but during a succession of mild days—as they do not seldom occur during this, and next month—pruning may be carried on as advantageously as at any time. And when the question is whether to prune now or not at all, we say, by all means prune now, provided the tree needs pruning, and you know what to prune for. Without a definite object it is better not to prune at any time.

Girdled Fruit Trees.—When there is much snow on the ground so that mice and rabbits are prevented from finding their necessary food they will as a last resource, gnaw the bark of young fruit trees which in consequence become more or less seriously injured. If only a small portion of bark has been destroyed, and the tree is otherwise in healthy condition, new bark will grow over the wound again in a season or two; but if a complete ring all around the stem has been eaten off, the tree will surely die unless surgical aid is given.

As soon as the injury is noticed, the wound should be covered thickly with soft clay or soil, and tied up firmly with matting or rags. In May—about grafting time—the bandage is to be removed, the wound cleaned, and four or five cions from the same tree—or another of the same kind—are to be inserted so as to unite the upper with the lower edge of the bark, exactly as in cleft grafting. If the operation is carefully performed not one tree in a hundred need die, and the wound will heal over completely in a few years.

Mice may easily be prevented from gnawing trees, by simply tramping the snow down a few feet around the stems. This has to be done after every snow-fall, of course, and as the mice are sometimes earlier at work than man, they do occasionally get the best part of the bargain. Banking or hilling soil around the stems is therefore safer. The mounds should be twelve to eighteen inches high, as steep as possible, and firmly packed all around.

When only a few trees are to be protected, tar-paper or any kind of cloth, or better still tin, may be tied around the stems as much below the surface as feasible without injuring the roots, and ten to twelve inches above. Where rabbits abound these bandages should be carried up at least two feet.

Leaves are Nature's manure, and, as in everything so here, we can learn much from her by following her ways. The rich soil in fence corners, and other places sheltered from winds, is largely due to the leaves that have accumulated and decayed there during a series of years.

There is hardly any more profitable work during winters when there is no snow in the woods, than to gather leaves. Where livestock is kept unlimited quantities may be utilized for bedding; otherwise they may serve an excellent purpose for mulching Strawberries and other plants. They may also be strewn thickly along the rows of Raspberries, Blackberries and Currants, if covered sufficiently with manure or soil to prevent their being blown away by the wind. A compost of leaves, stable manure and

soil, prepared now, will make a most excellent top dressing for newly planted Strawberry beds next summer.

THE AFTERNOON SUN.

That the afternoon sun injuriously affects the trunks of fruit trees is well known, though perhaps the full extent of the injury, as well as its peculiar character, is not fully comprehended. Cherry trees having round, smooth trunks, rarely shaded by the branches are injured most; yet the injury to Apple trees is but little less, while the injury to Plum, Pear and Peach trees, and even to Gooseberry and Currant bushes, is often so great as to occasion decay.

The injury proceeds from the over-heating of the sap. The position of the trees is unnatural in this that on account of isolation and pruning the trunks cannot be shaded by their own or others' tops. While the forenoon sun begins the heating of the sap, the temperature is not raised to such a pitch as to occasion injury until sometime in the afternoon, hence it is commonly said that the afternoon sun occasions the injury. But protecting from the morning sun and from the first hour or two of afternoon sun would avoid the injury, as the balance of the afternoon sun would not be sufficient to heat the sap to the injuring point.

It should be remembered that the cool night air, re-inforced by the falling dews, very materially reduces the temperature of the entire trunk, and several hours of sun are necessary to heat up the bark and then the sap. It would appear to be the wiser plan to guard against the sun during the earlier hours, though the contrary plan is generally adopted. This injury to the trunks of trees is greatest in the South, though not fully so great as the actual difference in temperature of the air would indicate; for the adaptability of those trees grown in the South to withstand greater heat, makes the damage to them less than would be inflicted by an equally high temperature upon trees in the North.

This would indicate the fact that trees may become accustomed to their conditions—a truth. Trees grown so closely together that the trunk of each is shaded by the others, if subjected to the heating action of the sun, are much more injured than those which have been grown isolated and thus accustomed to this heat. This should be taken into account when trees grown closely together in the nursery row are transplanted, and greater care be taken to protect the southern side of their trunks from the hot sun. Such trees as the Cherry, Peach and Plum, and some varieties of the Apple, having bright, smooth and compact bark, grown in nursery rows, are greatly injured by transplanting to positions so isolated that their trunks are not shaded by the foliage of other trees; and if trained high the first year after transplanting, will make no growth in the south and but little in the central belt, unless protected from the sun.

When we see a tree dying, and it is apparent that the cause of this decay is the burning of the bark and healing of the sap by the sun, we are apt to assign the effect to its proper cause. But generally when the injury does not prove fatal we fail to perceive the cause, or else ignore it. A perfectly healthy tree, and one symmetrically developed only can produce the highest yields

and the nearest perfect fruit; and in the struggle against insect and other depredators such a tree has a great advantage over one unthrifty and abnormally developed, as insects and fungi will always attack the least healthful and vigorous part.

In this connection I may state that in the South, at least, it is very apparent that the proportion of unshaded Pear trees afflicted with blight is four times that of those protected. Even in the North a majority of our orchard trees will be found, when not protected, with trunks flattened, and more or less diseased on the southern side. This is certainly due to the injury resulting from the heat of the sun, since the flatness being always on the south side shows that the injury always comes from that direction, and it is hard to conjecture any cause other than the sun which would invariably proceed from this point. A flattened (undeveloped on the flat side) trunk must lead to an undeveloped top on that side; and this further increases the injury, for the trunk receives less and less shade from that side—the side where it is most needed. And as the injury and disease progress, the more successful in their attacks will be insects and fungi, which will always favor the diseased portion.

The trunks may be protected by driving a wide board down on the south side, or by fastening it loosely to the trunk, enlarging the fasteners as the growth of the tree demands. Two boards nailed together at a slightly obtuse angle are better than one, and equal in effect too, while requiring fifty per cent less material than a box, often recommended. But I consider the best plan, with Apples and Peaches at least, to form low spreading tops, having just as little trunk as possible. By this plan the injurious effects of the hot sun are avoided; the effects of winds are lessened, and the diseases of the trunk and the work of enemies to this part of the tree are reduced by just so much. The best Peach and Apple trees I have ever seen had no bare trunk whatever, the limbs branching out at the surface of the ground.

JOHN M. STAHL.

A SERVICEABLE STORE-HOUSE.

The great convenience and advantages of a good store-house for fruits and vegetables are not as extensively known and appreciated as they should be; and much disappointment and loss are yearly sustained by those that have no such building. It is not necessary that such a structure should be an expensive one. Any farmer or gardener that can build an ordinary shed can easily construct a store-house that will fully answer the purpose, and for the benefit of those who may wish to construct such a building,—and no fruit grower or gardener should be without one,—will submit a simple plan, at once, cheap and durable.

Any substantial out-building large enough to hold the crops to be stored, may be made to serve the purpose. On the inside, about fifteen inches from the wall, build a partition of plank, raise this to the height of four feet or better still, to the loft. Fill the intervening space with earth, which is durable, and is best, but straw, sawdust, or forest leaves will do, only these will have to be frequently replaced. A good close loft is essential, over which straw or sawdust should be spread a foot or so in thickness. Through the middle of the room, running

from each side of the door to the opposite wall, raise plank partitions about three feet high; these form a passway which is quite necessary. The house will thus be divided in two compartments, which may sometimes, advantageously be divided into still smaller ones. The wall of the building from outside to inside, will be about twenty inches thick, consequently the doorway will be the same number of inches in depth; on the inside hang a light door, and a heavier one on the outside; and when closing, after all crops are stored, fill the intermediate space with straw.

For storing Sweet Potatoes, which are, perhaps the most difficult product to keep the apartment designed for their reception should be divided into narrow cells by partitions which serve the purpose of ventilators at the same time. These partitions or ventilators, as we may term them, can be readily made by nailing thin, narrow boards on both sides of upright pieces, an inch thick, and about three feet high; lap the edges as is done in weatherboarding of a house, bevel—except two or three short spaces—the alternate edges of the lap so as to leave sufficient space between the boards to allow the passage of air into the inner space. These ventilating partitions should be made of sufficient length to reach across the apartment, and should be set up about twenty inches apart. Potatoes carefully stored in this manner and covered well with straw or soil, almost invariably keep well for a long time.

Apples, Turuips, in fact almost all winter fruits and vegetables, may be kept in good condition in such an all-purpose storehouse, which in many instances, will pay for itself in one season.

J. T. BAIRD.

THE COMET PEAR.

Among early Pears this new variety now introduced by John S. Collins, Moorestown, N. J., promises to take a prominent rank. The original tree, which is estimated to be between fifty and one hundred years old, was found growing in the Highlands of the Hudson in a most unfavorable situation among bushes and rocks, with apparently not room enough for its roots to penetrate. The fine appearance and good quality of its fruit attracted the attention of the owner and some fruit growers who considered the variety of sufficient merit to be made known to the public. Not having seen the fruit ourselves we rely on the description furnished by Mr. Collins: "The Comet Pear has been grown to a limited extent in Ulster County, N. Y., latitude 42 degrees, for a few years. The trees are very vigorous and healthy, bearing abundantly when quite young. The fruit is of good quality, large size, splendid red and

yellow color, and ripens in its original locality, in July. According to the statement of the commission merchant who sold the crop, they were the best selling Pear of the season, bringing from \$6 to \$8 per bushel."

CELEBRATING THE GRAPE.

There is a pressing need of more light on Grape culture, for the reason that such knowledge can be turned to good account by nearly all classes. We cannot all have an orchard, or even a single fruit tree, said Ohio's veteran pomologist, M. Crawford, before the Summit County Horticultural Society. Some have not room for a row of Currant bushes or a Strawberry bed; but who has not room for a Grape vine? Its branches may be trained on a building or a fence. Its roots will run under the sidewalk, along the foundation, beneath the buildings—anywhere and everywhere—in search of plant food, which,

tawbas and some other varieties may be kept in a cool room for months. Last July I ate ripe Raspberries, Blackberries and Catawba Grapes—the latter grown in '83, and kept in a fruit house.

The vine, besides furnishing such delicious fruit, adds greatly to the attractiveness of home. Even the name, "vine-covered cottage" or "vine-clad hills," suggests that which, once possessed, can never be forgotten. The culture of the vine has always had a refining influence over those who have engaged in it. The natives of the vine districts of Europe plant vines wherever they go. You can almost pick out their homes as you drive through the streets of any city of this country.

Grapes may be grown in all parts of the United States and Canada, wherever a Grape grower can be found, and the more unfavorable the locality the better generally will be

his success; for this reason: The greater the difficulties to be overcome, the greater effort is put forth. If he lives far north, he will cover his vines in winter; if too far south, he will grow them on the north side of a hill or building. If his ground is too wet, he will drain it, or grow his vines in a raised border. The hills of Southern Ohio are especially adapted to this fruit, but Cincinnati gets its Grapes from the shores of Lake Erie. All over the South the vine is at home, but New Orleans sends to New York for Grapes. Michigan, cool and level, the last place one would expect this warm-blooded fruit to flourish, sends hundreds of tons to Chicago, and sends cuttings to France.

Some parts of our country are so favorable to this industry that success comes almost without an effort, but people are slow to learn that it may be carried on successfully almost anywhere. Dr. Buckley, now traveling in Europe, writes of a noted

vineyard where the vines are planted in baskets and fastened to bare rocks six or seven hundred feet high.

CONNECTICUT NOTES.

At the recent meeting of the Connecticut State Board of Agriculture, Gov. Hyde related his success in renovating old orchards by plowing and cultivating. But it was thought that too deep plowing might work harm. Peach orchards were also greatly benefited by cultivation, but was thought harmful for quinces, though of well known efficacy in some other states.

Mr. J. H. Hale, the practical nurseryman of Glastonbury, said that the Keiffer pear does not mature with him, and he thinks that it is unsuitable for the vigorous and changeable climate of New England.

THE COMET PEAR.

dissolved in water, is carried to the leaves and boiled down, as it were, and converted into Grapes. What an opportunity this is for every man and woman to add to the comfort, health and happiness of those dependent on them! Horticulture gives to workingmen almost the only opportunity of adding to their income outside of working hours, and this branch of it is especially inviting to all amateurs.

I once know of a large vine in a city lot that produced over a hundred dollars' worth of Grapes each season for several consecutive years. How much is it worth to have all the Grapes one wants for himself, his family and his friends for even three months in the year? And this is within the reach of nearly all, without making any effort to keep them beyond the season. With a little care, Ca-

The Flower Garden.

SNOWED UNDER.

Of a thousand things that the Year snowed under—
The busy Old Year that has gone away—
How many will rise in the Spring, I wonder,
Brought to life by the sun of May?
Will the rose-tree branches, so wholly hidden
That never a rose-tree seems to be,
At the sweet Spring's call come forth unbidden,
And bud in beauty, and bloom for me?

Will the fair, green Earth, whose throbbing bosom
Is hid, like a maid's in her gown at night,
Wake out of her sleep, and with blade and blossom
Gem her garments to please my sight?
Over the knoll in the valley yonder
The loveliest buttercups bloomed and grew;
When the snow has gone that drifted them under,
Will they shoot up sunward, and bloom anew?

When wild winds blew and a sleet-storm pelted,
I lost a jewel of priceless worth;
If I walk that way when snows have melted,
Will the gem gleam up from the bare, brown earth?
I laid a love that was dead or dying,
For the year to bury and hide from sight;
But out of a trance will it waken crying,
And push to my heart, like a leaf to the light?

Under the snow lie things so cherished—
Hopes, ambitious and dreams of men—
Faces that vanished, and trusts that perished,
Never to sparkle or glow again.
The old year greedily grasped his plunder,
And covered it over and hurried away;
Of the thousand things that he hid, I wonder
How many will rise at the call of May?
O wise Young Year, with your hands held under
Your mantle of ermine, tell me, pray!
ELLA WHEELER.

SEASONABLE HINTS.

Next Summer's Garden.—Consider well and decide now what plants you wish to grow for next summer's garden, and govern yourself accordingly. Conclude upon the plan of your flower garden or beds, the kinds of plants you intend to order, how many of them, what you shall raise from seeds, slips or by division, when and how, and having formed your plans, adhere to them.

Don't wait for the seedmen's novelty sheets before making a selection. If you wish for pleasure in your garden, select plants of tried and sterling merit, and, if you have a few dimes more to spend, try a few of the novelties just for fun, but don't be disappointed if they fail to surpass everything of their race you used to grow.

Soil for Flowerbeds.—How to bring it into best condition and composition may also be profitably considered now.

Heavy Soils are always benefited by an addition of sand, and there is no better season to cart it on than winter. It should be scattered evenly over the frozen ground, and at the spading in spring be thoroughly mixed with the soil.

Leaf mold and well decomposed stable manure are excellent for any soil, heavy or light. Fresh, coarse manure should be avoided in flower beds, and if no other is obtainable, it should be broken up as finely as possible and composted with soil a few weeks, or better, months before it is applied.

Propagating Carnations.—The easiest way to propagate Carnations is to layer them in the open ground when the plants are in full bloom or a little after, but they may also be increased by cuttings or pipings put in boxes or pots in gentle heat during January or February. When they have become sufficiently rooted they are to be potted in three inch pots, and early in May planted out in the open border in good, rich garden soil. And rich will be your reward.

THE MOON FLOWER.

Ipomœa noctiflyton—or *noctiflora*.

I was glad to see the reference made to this most beautiful climber by Mr. Chas. E. Parnell, in the December number of the AMERICAN GARDEN, although I think his method of keeping the old plant over is much more troublesome than perpetuating it by cuttings, which, put in the usual way in October root as freely as *Coleus* or *Geranium*, and will, if desired, make plants sufficiently large to fill a six inch pot by the time of planting out in the open ground in May. In my experience of over thirty years as a florist we have never distributed a plant that has given so much satisfaction as this. Its characteristic property of expanding its moon like flowers only at night or in dull days renders it peculiarly interesting.

This night-blooming habit of the Moon Flower was used in a way by the proprietor of a German Lager Beer Garden in the suburbs of Washington a few years ago so as to form one of the attractions of the place.

IPOMŒA NOCTIFLYTON.

He had all the arbors and verandas of his garden covered with it, and advertised it as a great attraction on moon light nights. Flocks came to see it, and were well rewarded, for it is one of the most beautiful sights on a moon light night in autumn to see hundreds of these flowers, like gigantic white butterflies hovering among the green leaves.

During the months of September and October we received scores of letters asking if the plant was hardy, and if not, how to keep it over winter, showing the great interest felt in it. To all such we gave the reply that as it was not hardy in the Northern States the simplest way was to propagate it by slips in the usual manner and keep it over winter with other house plants, setting it out in May at about the time when *Coleus* and other tender plants are planted outdoors. There is no doubt that it will be planted by thousands of amateurs in gardening next season, as its easy growth enables it to be sold as cheap as almost any

other plant in cultivation. Being a climber it requires something to adhere to. It can easily be trained on old walls, fences, or dead trees, or as a covering to exclude the sun on verandas trained on strings or wires nothing is more suitable. Plants set out in May will attain a growth of ten to twenty feet in one season, according to suitability of soil and location, beginning to bloom in July and continuing without intermission until frost. In Florida, South Carolina and other Southern States it is a hardy perennial, climbing freely to the tops of trees fifty feet in height.

PETER HENDERSON.

DESIRABLE WILD HERBACEOUS PLANTS.

It is always pleasant to note any increase in the popular love for wild flowers. Of late years the demand for them in the garden has increased rapidly, and a number of our formerly neglected wild plants have become garden favorites. There is still abundant opportunity, however, to increase the acquisitions from our fields and woods. Two important difficulties hinder a more general cultivation of wild plants. One is the disposition to slight common objects, and the other is a lack of knowledge as to what are the desirable species. As an aid towards removing this latter difficulty, I subjoin a list of indigenous plants which have appeared to possess strong qualities as I have seen them growing in botanic gardens and country yards for the last few years. The species are all natives of the states lying north of Virginia and east of the Mississippi.

Calltha palustris, Marsh Marigold, "Cow-slip." Desirable among other plants for low places where it makes much display in very early spring.

Anemone dichotoma, (*A. Pennsylvanica*), Large Windflower. I have seen very beautiful displays of this plant in shady gardens. On rich ground it makes a show for a long time.

Actœa spicata, var. *rubra*, Baneberry, Red Cohosh. The dense spikes of red berries are very showy among other plants. They are very effective in clumps. The white Baneberry (*A. alba*) is less desirable. Both species appear to be easily grown.

Nymphaea tuberosa and *N. odorata*, White Water Lilies. Almost indispensable to a pond, where they may be easily grown. The western *N. tuberosa* is the more showy but the common eastern *N. odorata* is much the more fragrant.

Dicentra Cucullaria and *D. Canadensis*, Dutchman's Breeches and Squirrel Corn. Two very pretty and delicate vernal plants which deserve more general notice. I see the *D. Cucullaria* oftener although the other is probably the prettiest.

Violas, Violets. Several of the wild Violets are pretty in cultivation, especially *V. pedata*, the Bird's-foot Violet. This succeeds best on light sandy soil. *V. cucullata* makes too large leaves. *V. rostrata* is a very desirable species. I have never seen *V. sagittata* in cultivation, but I see no reason why it should not do well.

Cerastium arvense, Chickweed. In dry shady grounds I have seen this plant making most attractive clumps of bright green several feet in diameter with the white flowers

nearly an inch across, borne in profusion and contrasting beautifully with the dark leaves. Mowing with a lawn mower appeared to do it good.

Hibiscus Moscheutos, Marsh Mallow. Our most showy plant for a while.

Ceanothus Americanus, New Jersey Tea Produces pretty flowers in abundance but unfortunately they are of short duration.

Desmodium Canadense, Tick Trefoil. In a dry garden I have seen this tall herb making a beautiful clump of light purple. It struck me as being a very desirable plant.

Spiraea Aruncus, Goat's Beard. For masses on dry ground the effect is beautiful.

Oenothera fruticosa, Sundrops. Takes kindly to cultivation on warm soils and makes a display which rivals many of the cultivated Coreopses.

Lythrum Salicaria, Loosestrife. This plant is often cultivated. It takes care of itself and always gives a profusion of light purple conspicuously spiked flowers. Desirable for masses, especially about ponds.

Opuntia, Prickly Pear. This genus of Cacti has some odd and desirable members. I have seen in cultivation both *O. Rafinesquii* and *O. Missouriensis*. They are hardy throughout, and give a profusion of large waxy-yellow flowers.

Aster, Many of the Asters do well in cultivation. They all demand a good soil which is not much affected by drouth. The species which I have noted as especially desirable are named in the following order of preference: *A. Shortii*, *A. spectabilis*, *A. Nova-Angliae*, *A. multiflorus*, *A. sericeus*, *A. laevis*, *A. ptarmicoides*.

The flowers of many *Solidagos*, Golden-rods, are attractive under cultivation but the plants themselves are not often neat and attractive. *S. virgata*, var. *juncea* is one of the best. *S. odora*, *S. Shortii*, *S. speciosa* and *S. nemoralis* are among the best of the species.

Helianthus, Sunflower. For backgrounds some of the taller species, especially *H. grosse-serratus*, *H. giganteus*, *H. strumosus*, and *H. laevigatus*, are very effective and are at present in good demand.

Campanula rotundifolia, Harebell. One of the prettiest of delicate herbs for dry hillsides and rocky places.

Collinsia verna, A little annual as desirable and as pretty as Phlox. Easily grown.

Monarda didyma, Oswego Tea, Bee Balm. It is a pity that this very showy and ornamental plant is not better known. Few plants excel it.

Phlox, All the species of Phlox would no doubt do well in cultivation. Every one knows the two common species, *P. maculata* and *P. paniculata*. Other species which I have admired are *P. Carolina*, *P. glaberrima*, *P. subulata* and especially *P. pilosa*.

Asclepias tuberosa, Butterfly Weed, Pleurisy Root. Probably the most showy of our native herbs. It is an acquisition to any garden.

Polygonatum giganteum: Solomon's Seal. Much grown in Europe.

Lilium Canadense makes a very fine display in cool shady places, although I have sometimes seen it doing well in the open sun. I have never seen our other native Lilies extensively cultivated. L. H. BAILEY, JR.

ASTILBE JAPONICA.

Hoteia and *Spiraea Japonica* are synonyms of this beautiful hardy perennial plant which constitutes one of the most pleasing ornaments of the herbaceous border. But since it has been found that it is also excellently adapted for forcing, it has become one of the most favorite winter flowering plants, and is grown by the hundreds of thousands by our florists. All that is necessary for

ASTILBE JAPONICA.

forcing is to take up some clumps, divide them if too large, pot in rich soil, keep them moderately cool at first, and when wanted to bloom remove to a warm, light place. Its compact habit, the fresh green color of its leaves, and its elegant, graceful spikes composed of multitudes of minute white blossoms make the plant especially suitable for dinner table decorations, vases and loose bouquets.

WIGANDIA CARACASANA.

For the production of massive tropical effects this plant is invaluable. It is of luxuriant growth, attaining a height of six

WIGANDIA CARACASANA.

to seven feet in one season; its leaves grow to immense size, in rich soil three feet long by fifteen to eighteen inches wide, they are beautifully veined, and ribs and stems covered with crimson hair. The plant is perennial, but for decorative purposes it is best grown annually from seed, as old plants lose their luxuriant appearance. The seed should be sown in heat as early as possible, the

young plants potted and re-potted as required, and transferred to the open ground at "bedding out" time. They require very rich soil and an abundance of water. The Wigandia is not a new plant, but probably unknown to many of our readers who could employ it to excellent advantage in their gardens.

HYBRID PERPETUAL ROSES.

To grow Roses to perfection is high art indeed, and those who aspire to it should carefully study the method of those who excel, and adapt their methods to their own conditions. Capt. John B. Moore, President of the Massachusetts Horticultural Society, is justly recognized as one of the most experienced and successful Rose growers in the country, his advice is therefore of great practical value to every one interested in the "Queen of Flowers."

Mr. Moore said that he had cultivated Roses with great interest, and from their beauty and fragrance had received more real pleasure and enjoyment than from any other flower that he had grown. The land on which most of his Roses are planted has a slight inclination to the south; the soil is a sandy loam with a loose sandy subsoil, and most of it is quite dry. It would be considered unsuitable for Rose culture, but it was conveniently situated for the purpose intended, though not such as he would have chosen could he have done better. The chief fault was that it was subject to drying up too quickly; but it had excellent natural drainage,—too good, indeed.

The remedy applied was a dressing of a material often found in sand banks and improperly called marl, but really a dried or consolidated quicksand. It looks like clay and is as hard to excavate, but, unlike clay, when dried it readily falls to pieces, and the

particles are finer than common flour. About one inch in thickness was spread on the Rose border when dry, and worked in with a harrow and cultivator, and every rain carried the minute particles into and intermixed them with the soil, changing it from a porous, leachy, to a retentive soil, fairly suitable for the purpose intended. There was then applied a dressing of stable manure at the rate of ten cords to the acre; this was ploughed in very deep, and the land afterwards levelled with a harrow, which completed the preparation of the land for the planting.

The Roses were then planted in rows four feet apart and three feet apart in the rows, so as to work between them with a horse. One-year-old plants, mostly on the *Manetti* and brier stocks, were chosen; part were set in autumn and part in spring, but both succeeded equally well. The after cultivation has been to keep the ground clean and free from weeds, and in the fall to bank up the plants about a foot high with earth from the

spaces between the rows. When the earth is removed from around the plants in spring they are pruned, the weak, poor wood being cut out, and the slow-growing varieties cut back to six or eight inches, while the stronger growers should be left ten or twelve inches in length. In giving water to Roses or any other plants, there is no better way than to imitate Nature and wet the land thoroughly.

The Window Garden AND GREENHOUSE.

THE WINDOW GARDEN FOR JANUARY.

In practical gardening January is the most inactive month of the year. Covering up and mulching out-of-doors have been finished; indoors our plants are in their winter quarters. Zonal Geraniums, Carnations, Speciosa Fuchsias, Abutilons, Oxalises, Paris Daisies, Nasturtiums, Sweet Alyssum, and may be some Callas, Begonias, Pansies and Violets are in blossom in our windows; and Pansies, Violets, Alyssum and Meteor Marigolds in our cold frames. Window plants need attention in watering. Give liberally to those in rapid growth, as Callas, Carnations and Primroses, and sparingly to those more inactive. Keep plants free from insects, and remove dead leaves or decaying parts of stems or leaves; never allow fallen leaves to lie on the fresh ones, as they are apt to rot them. Stake and tie up your plants as they need it. If the leaves get dirty, sponge them gently with soft soapy water. Do not repot any plants this month, unless you have sufficient accommodation for them, or the condition of the soil in the pots by reason of worms or other deleterious cause, should render it advisable; if their being pot-bound is all that ails them, let them alone. Ventilate a little every warm day, and even in frosty weather while the sun is shining brightly on the windows a little ventilation may be given.

COLD FRAMES.

A variety of flowers and vegetables may be contained in these. Keep them well wrapped up in severe weather, and in the case of plants in bloom, as Daisies, Pansies and Violets, in favorable weather or while the sun is shining on them, remove the mats or other wraps used to put over the sashes and ventilate a little. But in the case of Anemones, Polyanthuses and others not in bloom or required to come in early, they may be left covered up for days, sometimes weeks together, in hard frosty weather. I find dampness does more mischief than frost in cold frames.

I have a multitude of plants in cold frames, and which I wish merely to winter safely—for instance, Strawberries, young Roses, Rose cuttings, Polyanthuses, late Pansies, Hydrangeas, very young Evergreens, Irish Ivies and bulbs of sorts. When their leaves and stems were perfectly dry, and the surface of the ground dry, I spread some quite dry Oak leaves over them loosely, about three to five inches deep, and put on the sashes to keep them dry. Endive fit for use, Spinach, Leeks, young Lettuces (but not any approaching maturity), Chives, Parsley and Cabbage plants I also treat in the same way. So long as the leaves and plants can be kept dry, so long are they safe; they are not subject to rapid fluctuations of temperature, and do not require nearly so much attention as in the case of frames whose wrapping is outside the sashes. But frames containing Radishes, heading Lettuces, and also hotbeds generally, should be covered for protection from the outside only.

The well-known and very useful cold-pits are like sunk greenhouses, have no fire

heat, and must be kept frost-proof by outer coverings. Tender Conifers, English Hollies, Camellias, Azaleas, Myrtles (not the Periwinkle, but the aromatic evergreen shrubs) and the like, are wintered safely in cold pits, and when placed on shelves or a staging near the glass, so, too, may be Geraniums, Carnations, Cinerarias, Fuchsias and aniums, Carnations, Cinerarias, Fuchsias and the host of other plants so familiar in our windows and cool greenhouses. Cold pits are apt to be damp and the atmosphere musty, and many soft-leaved plants, as Geraniums, Begonias and Heliotropes, suffer considerably in consequence. The remedy is vigilance in cleanliness, timely and abundant ventilation, and keeping plants and pit as dry as possible consistent with the nature and welfare of the plants contained in it.

SLIPS.

Cuttings, as gardeners say,—yes, I know some gardeners who even make a distinction between the two, but I question if they can prove it,—may be made at any time of year, providing we have proper conveniences for them. In the window garden we do not look for any special convenience for rooting slips in winter, nevertheless, I would advise you to plant a few slips,—dibble them into the earth in the pots containing the old plants. If they grow, it is a gain; if they perish, the loss is little. When you cut in, pinch back, or break off accidentally a shoot, don't throw it away, but make it serve as a cutting. O, Carnations any way dibble in a few slips; they may take several weeks to root, but most of them are likely to live and afford you strong plants to set out next April or May. If you wish to increase your stock of Roses, shrubs, or Grape vines, go out-of-doors, cut off some good, firm young shoots, cut them into 6-inch lengths, tie them up into little bundles according to their kind, and bury them in a box filled with moist sand, earth or sawdust, and keep them in a cool cellar or building till spring. When planted out thickly in close rows, most of them should grow. WM. FALCONER.

A MINATURE HEATING APPARATUS.

Many minds seem to be engaged in solving the problem of inexpensive heating apparatus for small plant houses, but it is the amateur plant growers, not the professional manufacturers. The latter appear to have a singular aversion against so insignificant a thing as a small plant house. Yet we have no doubt that a fortune awaits the man who invents and will manufacture a cheap, easily managed heating apparatus for small greenhouses.

In former numbers of the AMERICAN GARDEN, we have given various plans for their construction, but for cheapness and simplicity the following one constructed by our friend, Mr. N. T. Lackner, is not excelled by any we have yet heard of. To a discarded wash boiler, he says, I have attached a top terminating in a 3-inch pipe. The pipes are made of zinc soldered together so as to be perfectly water-tight. The top pipe runs to an expansion tank at the south end of the house, from which the return pipe leads back to near the bottom of the boiler. The north side of the house remains without the bottom heat which condition, I find, suits some kind of plants perfectly. The boiler rests upon a brick and cement-lined pit in the center of the house near a collar window;

and boiler and pipes together hold only fifteen gallons of water. A one-inch pipe connects the pit with the open air.

The heat is furnished by an oil-stove with two four-inch wicks, and by burning only one, or both at the same time, I can regulate the temperature as desired. For a larger house, a stove with four wicks would no doubt work satisfactorily. All my plants, seedlings and cuttings, included are doing remarkably well, and are all that any amateur could desire. This leads me to the conclusion that oil-stoves can be used for heating green-houses, without the least detriment to plants.

RANUNCULUS AND ANEMONES.

As garden flowers these beautiful plants have never met with much success in the northern States, our winters being too severe for them, but in frames or pots in the house they may be brought to high perfection. Their prevailing colors are scarlet, rose, white and blue. The roots are a solid, flattened mass, and may be planted at any time, three or four in a five to six inch pot. They require very rich soil, good drainage and a general treatment similar to that of Dutch bulb.

Nos. 1 and 2, in our illustration on the following page represents the double forms of Ranunculus, No. 3, Double Anemone and No. 4, the Star Anemone.

FASHIONABLE FLOWERS AND DECORATIONS.

Floral decorations like flowers, have their period of being fashionable and then decline, to give place to a new fancy. It requires two years for a flower to reach the zenith of popularity; the third season it is usually thrown into the shade. The run on yellow flowers began with the partiality for *Calendula Meteor*; this blossom was all the rage for two seasons; it indirectly brought in favor yellow Roses, which were combined with those of every color. A cluster of yellow flowers was, in fact, indispensable in the *made* bouquet or corsage bunch. But a very few years since it would have been considered shocking taste to combine red and yellow Roses; the yellow flowers hold their own in the Rose varieties, but the *Calendulas* with their gorgeous color, are now despised, and are thrown out by growers because their day is past.

For two years *Catherine Mermet* Roses were in high favor, but they have now settled down with *La France*, *Cornelia Cook*, *Niphotos*, *Jacqueminots* and half a dozen other varieties, into standard Roses of admirable qualities, but the furor for them no longer exists, in this country at least.

HOLIDAY SURPRISES.

It is well understood by metropolitan florists that they must constantly introduce novelties in flowers, their arrangement, and in decoration, to control the custom of those who lavish money in the perishable greenhouse beauties. During the holidays plant-men bring in their surprises, about which they have kept profound secrecy. At Christmas and New Year's they can demand a large price for specialties, all blossoms at that time are costly, and novelties bring preposterous prices. There are two or three leading florists who will pay fabulous sums for wild flowers, forced in mid-winter. A few stalks of Sweet Clover bloom—or sprigs of Buttercups that would be trodden down

ruthlessly in the field during summer, can be sold for thirty-five cents a flower during the holiday week.

FLORAL BOXES.

Equisitely arranged boxes of cut flowers were more fashionable floral gifts this season at Christmas and New Years' than tied up bunches or designs. Charming taste was shown in these boxes, many of which were satin lined in pale tints. There were boxes in "blue," and those in "pink," and some in "gold." The "blue" boxes were of satin paper, lined with satin or plush of delicate blue shade. Violets, from the pale Neapolitan, to the rich purple Czar, were laid so that the shading was perfect. Nestling in one corner of the box would be a small cluster of Swanley White Violets, or a few Clover blossoms to give chic to the effect. "Pink" boxes were filled with Rose-buds, and "gold" boxes contained Maréchal Neil and Perle des Jardin Rosebuds, Butterfly Orchids, and a knot of bright Buttercups.

BOUQUETS.
